Consumer products helped make Hindustan Lever a household word. Today the Company is moving in a new direction, from the home to the heart of India's core sector.

**Directions for growth**

Today's emphasis is clearly in **technology-intensive** areas of national priority. Over 60% of the total investment in fixed assets today represents core-sector projects or sophisticated technology.

**Using science with sensitivity**

The Company's **Research & Development** has always been attuned to India's needs. Significant R & D successes have been achieved in import-substitution of edible oils and energy conservation. A third major breakthrough is the development of a plant-growth nutrient which boosts crop yields at low cost.

**Products made in India — for the world**

Quality products and widespread distribution are Company strengths that have contributed to an impressive export success story. An increase in turnover by 70 times — from Rs. 10 million in 1971 to Rs. 700 million in 1983.

**A Company of people**

This is a Company of people, not just employees. People committed to excellence who have made us what we are — a Company meeting the challenge of change.

**Hindustan Lever Limited**

# Little Cause for Cheer

THE IMF paints an optimistic picture of the world economy both in the immediate future as also in the medium-term upto 1990 in its latest "World Economic Outlook", just published. The report observes that the pace of recovery of industrial output in the industrially developed countries accelerated to five per cent in 1984, the best performance for these countries since 1976. For the developing countries as a whole, the growth of output recovered to about 3.8 per cent with the non-oil exporting countries among them faring somewhat better with a growth rate of 4.5 per cent. For many developing countries, particularly those of sub-Saharan Africa, however, per capita incomes continued to be much below the levels achieved in the past.

The economic performance of even the developed countries continued to be marked by persistence of high levels of unemployment and, as the IMF puts it, "major financial imbalances". The IMF's report is constrained to note that despite the recovery in output in these countries, unemployment levels show no sign of declining—something which according to it "is highly unusual by historical standards". This is hardly surprising if it is considered that the rather weak and faltering recovery comes after a relatively long period of intermittent stagnation. In any event, the present recovery is largely concentrated in the US and has not sufficiently spread to Europe. And even the US economy continues to be plagued by unprecedented levels of budgetary deficits and interest rates. High US interest rates are attracting the savings of the rest of the world to the US in the form of large capital inflows and are thus coming in the way of rise in investment and capital formation in most of western Europe.

The external economic position of the developing countries, it is true, has shown some improvement. The aggregate deficit of the debtor developing countries declined quite sharply from $ 113 billion in 1981 to $ 38 billion in 1984. The ratios of these countries' debts to their exports has also declined. But this improvement in the external position of the developing countries has imposed a heavy cost on these countries in the form of intense adjustment efforts undertaken by them despite already low living standards. The IMF is hopeful that the pressure on these countries to tighten their belts further will ease in 1985. It expects average interest rates to remain lower in 1985 than in 1984 and the developing countries to be in a position to step up their imports modestly by about five per cent (in real terms) in 1985-86 without their external deficit worsening beyond the 1984 level.

The external financing requirements (current account deficit plus net private capital outflows) of the indebted developing countries are estimated to have declined from $ 150 billion in 1981 to $ 47 billion in 1984. Nearly one-fourth of this decline is believed to be on account of slowing down of private capital outflows. The overall improvement in the external position of these countries is reflected in a net increase in their external reserves to the tune of $ 22 billion.

The IMF's medium-term forecast for the world economy, based on its 'best estimate' of likely policies in member countries, places the growth rate of output in industrial countries at an annual average of three per cent during the six-year period upto 1990. While a higher growth rate is anticipated for Japan, the US and western Europe are expected to crawl at the same slow speed. Inflation rate is expected to remain low at around 3.5 per cent per annum. By 1990 international interest rates as measured by the LIBOR, adjusted for the US GNP deflator, is expected to come down to 3.5 per cent, which is clearly based on the heroic assumption of major changes in US policies in regard to budgetary deficits and domestic interest rates. The report also predicts 'moderate' weakening of the US dollar in real terms by about five per cent per annum during the next five to six years. The other scenarios painted in the report assume 'better' and 'worse' policies pursued by member countries. The forecasts with 'better' policies try to suggest a partial return of the world economy to the 'happy days' of the 1960s.

As for the developing countries, their debt to exports ratio is expected to remain high at 108 per cent in 1990 and their average debt service ratio will decline only slightly from 22.5 per cent in 1984 to 20.5 per cent in 1990. This is certainly not a prospect that these countries can look upon with much satisfaction.

## *Congress(I)*

### Cynical Cynicism

TAKING some liberty with the English language, one could aptly characterise the economic resolution presented to the AICC(I) meeting in New Delhi as an exercise in cynical cynicism. This was a thoroughly revised version of the original draft prepared by the Union Minister of Finance, Viswanath Pratap Singh. Singh's draft had not only made no mention of any commitment to socialism and the public sector, but even had sought to justify the omission 'theoretically'. He had held that "in the process of continued development, the policy instruments relevant to one stage cannot be treated as permanently sacrosanct. Nor are they ends in themselves." That this, again, was not a fit of absent-mindedness, but the articulation of a fully thought-out strategy is borne out by the operative blueprint of the Union government for the immediate present, *viz*, the Central Budget for 1985-86, and various other policy pronouncements and decisions made by the Finance Minister and the Prime Minister in the subsequent weeks. Furthermore, the political implications of this policy reorientation was not unclear to the Finance Minister when he had formulated his budget proposals. He had clearly noted in his budget speech the contradictions that crept in between the measures for raising investible resources and the survival of parliamentary democracy in a country with a large proportion of the population below the poverty line. He had even underscored the need for political wisdom on the part of the country's leadership in this situation. In practice, however, V P Singh chose to ignore the imperatives suggested by himself: he heaped burdens on the poor while giving bonuses to the rich.

Socialism, etc, has passed out of circulation in the Congress(I) vocabulary not just recently. Its eclipse really began with the re-emergence of Indira Gandhi in 1980. Overcoming its not-so-short fit of amnesia, the AICC(I) has now declared "unequivocally its commitment to socialism", asserting that "no other way was conceivable for solving the problems of the people". The resolution repeatedly mentions Jawaharlal Nehru to lay claim to the uninterrupted continuity of its commitments.

However, misconceived his plans and programmes and self-defeating his blueprint for socialism in India may have been, Nehru's fascination for some sort of socialism—of course, some milk and water variety of it—was genuine and longstanding. This was never so with Indira Gandhi who started making deliberate use of radical slogans, measures, etc, for immediate tactical gains. The first major instance was the famous 'Glass House' AICC session in Bangalore, during which she used her economic programme, including the call for the nationalisation of the big Indian banks, first to outmanoeuvre the Syndicate old guards and then to sack Morarji Desai from the cabinet. While projecting this supposedly radical platform, she was frank enough not to claim any mature thought devoted to it or any long commitment to or championship of these measures; they were, to quote her, merely 'random thoughts', hurriedly jotted down' on the eve of the session.

Even more cynical was her proclamation of the so-called 20 or 21 point programme about a week after the imposition of the Emergency in June 1975. In her first broadcast about the declaration of the Emergency, she had promised to come out soon with an economic programme, as if to sugarcoat the bitter pill. This she did about a week later.

In the first flush of supreme self-confidence, following the landslide victory in the Lok Sabha elections, Rajiv Gandhi and his so-called computer boys, lacking in any political experience as they were, had become arrogant enough to decide to dispense with the old populist mantle that used to cover the oligarchical rule of the Congress(I) or, for that matter, the Congress without the 'I'. Now against the background of the setbacks suffered by the party in the subsequent round of Assembly elections in 11 states and the by-elections for 26 Assembly seats thereafter, the elders and the junior cadres in the party have become bold enough to be vocal about the usefulness of the old idioms. Hence, the revision of the Finance Minister's draft and presentation of the resolution by the former Finance Minister with liberal incantation of *mantras* like 'socialism', 'public sector', and so on.

## *Assam*

### 'De-politicising' College Teachers

THE Assam Colleges (Taking Over of Management and Control) Bill, 1985, was introduced in the Assam assembly on April 4; and on April 8 (the three intervening days were holidays for the Assembly) it was debated and passed. There was anyway little doubt about the Bill's passage given the overwhelming majority of the ruling party in the Assembly—100 out of an effective strength of 109 (in a House of 126); but the opposition too, barring one independent member, supported the Bill and the leader of the two-member CPI(M) group indeed spoke in support of the measure. With the passage of the Bill, government is now empowered to take over those private colleges which come under the deficit grants-in-aid scheme.

The ostensible purpose of the legislation, as spelled out in the statement of objects and reason appended to the Bill, was that most of these colleges suffered from lack of basic facilities like buildings, equipment, hostel accommodation, etc, apart from the graver infirmities like absence of proper and uniform control and management of these colleges. "In order that the academic standard of higher education in colleges do not suffer for lack of these basic facilities and to help arise (*sic*) the standard of education by providing these basic facilities, it is necessary that government take over these colleges."

It is true that the colleges under the deficit grants-in-aid scheme in Assam (and, even more so, the non-deficit colleges) do suffer from all these ills and many more besides; but few of those concerned with the issue in the state—or even in the Assembly—were taken in by the government's argument that its move to take over the management and control, including the very substantial assets, of the more well-established of these colleges was motivated only by the stated considerations. The fact is that the 120 or so aided colleges in Assam do represent an important social force and the teachers (about 3,000) of these colleges, which are spread all over the state, wield considerable influence, especially in the rural and semi-urban areas, in matters which go far beyond mere teaching. Many of these colleges were established by public personalities who also happened to be academic figures; and the tradition of combining an academic career with public service has not entirely disappeared even now. Since under the existing arrangement it was open to a college teacher to take part in active politics, many of the teachers did so and some leading legislators in Assam, both in the government and in the opposition, have been teachers. Indeed, the present chief minister of the state was himself once a college lecturer.

However, the teachers as a body, like so many similar middle class groups, have by and large been active against the ruling party which, in Assam, has been always the Congress party barring the brief Janata interlude in 1978-79. Further, in the last five or six years of the Assam agitation, the teachers as a body and, certainly, the Assam College Teachers Association (ACTA) which claims, with some justice, to represent the overwhelming majority of college teachers in the state, have extended support to the agitation though they have not become part of the umbrella organisation, the All Assam Gana Sangram Parishad (AAGSP).

The involvement of the more active teachers in anti-Congress politics generally and, in the last five or six years, in pro-agitation politics specifically, has long rankled with the government. Naturally, there were many efforts earlier to break the united organisation of the teachers and during the Emergency, an organisation called All Assam College Teachers' Association (AACTA), comprising mainly pro-government elements, was floated. Little about AACTA is heard nowadays.

However, the prolonged frustrations over non-implementation of some of the long standing demands of the teachers and expectations that a government take-over, by overnight transforming college teachers into Class One officers of the state government, would dramatically improve their social and financial status, has of late influenced a considerable body of teachers to support (and in some cases actively plead for) such a take-over, though the ACTA still remains formally opposed to the move. The state government, acutely aware of these differences in the ranks of the teachers and equally alive to the fact that the governmentalisation of the services of the teachers would, at one stroke, neutralise an always potentially dangerous political opponent, came out with the Bill whose general anti-democratic character and specific anti-democratic provisions are striking. The Education Minister indeed candidly explained that one of the objectives of the measure was to put an end to the 'politicisation of teaching' in the state. The threat of transfer, for instance, would be a most useful weapon to discipline recalcitrant teachers.

The CPI(M)'s decision to support the Bill clearly was influenced by the fact that a substantial body of the teachers and, certainly, their representative body, the ACTA, supported the Assam agitation. While supporting the Bill, the CPI(M) leader in the Assembly dwelt at some length both on mismanagement of colleges and the college teachers' 'undesirable' political activities.

But in a strange reversal, the state committee of the CPI(M) has now come out with a statement which "deplores that the Government of Assam pushed this Bill through the assembly in a hurry, agreeing neither to refer it to a select committee nor to circulate it for eliciting public opinion . . . paying scant attention to the widespread public criticism against the measure". The statement also describes the measure as patently undemocratic and notes that direct control by government of primary education in the state has not merely not improved the situation but has led to endemic corruption. "Its action is politically motivated as it seeks to tighten ruling party's control over the colleges."

This turnabout is explained by party leaders to 'lack of communication' and the very short time that elapsed between the introduction and the passage of the Bill. Though the state committee's statement makes no mention to the support extended to the Bill by the leader of the CPI(M) group in the Assembly, sources close to the party reveal that the CPI(M) leader has been censured. Does this indicate a belated realisation that the party's stand on the Assam agitation need not define the party's stand on every other political question?

## *Nicaragua*

### Economic Sanctions by US

THE Reagan administration's bullying of the Sandinista government in Nicaragua has entered a phase of heightened tension. Perhaps it matters little that the economic sanctions ordered against Nicaragua by the US President on May 1 are something that Ronald Reagan had himself earlier claimed to be against. He was critical, for instance, of former President Jimmy Carter's grain embargo *vis-a-vis* the USSR. But his stand then may well have been influenced by the grain lobbies in the US.

Last week the US House of Representatives had rejected Reagan's proposal that the appropriated amount of $ 14 million be used to fund the operations of the contra rebels against the Sandinista government. Prior to the voting in the House, Nicaraguan President Daniel Ortega had offered a peace package to two visiting US Democratic Senators: a ceasefire with the principal guerilla groups, lifting of press censorship and restoration of civil liberties. The offer was conditional on complete stoppage of funding of the contras by the US.

Reagan has claimed that the Sandinista government's policies and actions constitute an unusual and extraordinary threat to the US's security and foreign policies. The situation, US spokesmen have claimed, was an emergency especially with Nicaragua taking new and bolder steps in its relations towards the Soviet Union. Ortega had indeed visited Moscow to secure financial aid amongst other things, soon after the US House had voted against military aid to the contra rebels. Ortega's Moscow visit is reported to have led some members of the House, who had earlier voted against aid to the contras, to support Reagan's decision to impose economic sanctions. Here the Sandinistas had little choice. Nicaragua's economy has been weakened by two years of war against the contra rebels and by relentless economic pressure applied by the US government. Its continuing attempts at securing a $ 158 million loan for agricultural development from the Inter-American Development Bank was again blocked by the US on March 8. The blocking was purportedly for 'economic reasons', which seems incredible when it is recalled that no similar action has been initiated against other Latin American countries whose economies are in far worse condition than Nicaragua's. The Soviet Union, following Ortega's visit, has assured $ 200 million in aid to Nicaragua.

The US economic sanctions mean prohibition by the US of all imports from and exports to Nicaragua and a ban on entry of Nicaraguan ships and aircraft. Nicaragua's consequent loss might seem small since its exports to the US in 1984, at $ 57 million, were only 17 per cent of its total foreign trade earnings (the value of its imports was about twice as large). But this is so only because, expecting such US action, the Nicaraguan government has reduced its trade with the US. In 1980 its exports to the US country were as high as $ 214 million while its imports totalled $ 249 million. Even so, a fifth of export earnings is still a large amount. Further, the US might now press some other Latin American nations to also break off economic relations with Nicaragua. In this changed scenario, the Nicaragua government's peace proposal seems to have been pushed into the background.

# Drug Policy in Limbo

THE tussle between the lobbies of Indian companies and that of multinational corporations is most clearly evident in the case of the drug industry. The Minister for Chemicals and Fertilisers, Veerendra Patil, even admitted in the Lok Sabha on April 15 that the long expected new drug policy is being delayed due to lobbies of manufacturers working at cross purposes. There was no unanimity in the recommendations of the three working groups set up by the Ministry to examine various aspects of the policy.

Reports are periodically planted in the press, mostly by spokesmen of the MNCs, that the country's health care efforts are being hampered by the absence of a favourable policy. For instance, introduction of new generation drugs for malaria, hepatitis B and so on, have, it is said, brought extensive relief in other countries. These drugs have so far not been manufactured in India because the prices and terms are unattractive.

The Indian-owned companies, however, contest this interpretation. Spokesmen of their lobby, the Indian Drug Manufacturers' Association, point out that the foreign firms are interested only in securing high returns, through transfer pricing, and monopolising the market. Under the existing policy the MNCs are expected to progress to the manufacture of basic ingredients two years after a new drug is introduced by them, with help from their parent company abroad. But, the IDMA alleges, the foreign firms capitalise on monitoring difficulties to continue importing drugs at the penultimate stage even after the time limit for indigenisation has elapsed. The Association goes on to claim that it is the Indian companies who have introduced all the major new drugs in the country during the past decade. Whether they are themselves making serious efforts to achieve self-sufficiency in drugs is a debatable issue. The Indian firms after all are said to be spending only about two per cent of their turnover on research and development, when the requirement is much larger.

Behind all these claims and counterclaims there are the two central issues of pricing and licensing over which the new drug policy appears to have got derailed. The prices of roughly three-fourths of all drugs is administered by the government, ostensibly as part of its objective of plentiful supplies at reasonable prices. The IDMA is keen that the prices be revised upwards to provide adequate returns. The losses incurred by public sector units like the IDPL are mentioned as illustrations of how the current price policy is adversely affecting financial performance and therefore fresh investment. On the other side, the Organisation of Pharmaceutical Producers of India, the apex body of 55 foreign held firms, is agreeable to a price freeze for two years at current levels, plus ten per cent. This is partly because these firms have mostly diversified into agrochemicals and related sectors which now constitute a major share of their operations. Also it is a shrewd bargaining move, for simultaneously the Organisation wants licensing in the industry to be relaxed. The latter demand is opposed by the IDMA, which on the contrary wants protection of areas pioneered and built up so far by indigenous companies. (This protection is already provided for in the existing policy.) The Association is agreeable though to the MNCs being allowed to market new high technology bulk drugs, for which the knowhow is not locally available, provided they completely indigenise their manufacture within the stipulated two-year limit.

In brief, the IDMA wants prices to be raised while the OPPI seems indifferent, and, the OPPI wants delicensing which the Association opposes. At present roughly 60 per cent of formulations and four-fifths of bulk drugs are being produced by Indian companies, comprising of the public, private and small-scale sectors. The tussle for market share between the foreign and local firms is bound to continue even after the new policy, which has been referred to a parliamentary consultative committee, is finally announced.

*Coir*

## Export Market Going Abegging

ACUTE shortage of coconut husk has caused a serious crisis in Kerala's coir industry which has for the past few years been passing through a difficult period. The drought in the state in the past two years has brought down coconut yields substantially. This, coupled with increasing use of husk as fuel because of the scarcity and high prices of firewood, has resulted in reduced supplies of husk to coir yarn producers. Not surprisingly, the price of coir yarn has gone up by 120 per cent in the past one year. Though the current year's coconut crop is expected to be quite good, it will not be able to ease the raw material supply position immediately since retting of the husk requires about ten months before it can be used for making yarn.

Meanwhile, according to reports, some 4,000 small-scale units in Cochin, employing about 40,000 people, have been shut down on account of the shortage and high prices of coir yarn. Exporters are now offering about 20 per cent more to producers than last year, thanks to the uptrend in the prices of coir products in the international market. But this is inadequate to compensate the producers for the sharp rise in the prices of coir yarn Owners of small-scale units have been demanding a 50 per cent increase in prices paid by exporters. They have also been pleading for larger supplies of coir fibre and yarn and have even suggested import of 10,000 tonnes of the raw material from Sri Lanka to tide over the crisis.

Kerala's age-old coir industry has been facing rough weather for the last few years and the drought of the last two years has only accentuated its difficulties. According to knowledgeable sources, at least a part of the blame for the mounting raw material shortages should be attributed to the licensing procedures and movement curbs introduced by the Kerala government in 1973, with the objective of enabling co-operatives to get their husk requirements at reasonable prices. The Husk Control Order, 1973, provides for monopoly procurement of husk at fixed prices. However, the advisory panels as well as the procurement committees created under the Order have proved ineffective, leading to artificial scarcities. The high-powered B Sivaraman Committee had hence favoured relaxation of these curbs.

Because of the constraints on supplies of husk, exports of coir and coir products have gradually declined since 1979-80. Exports, which account for over 30 per cent of the industry's output, have declined from 47,224 tonnes in 1979-80 to 27,949 tonnes in 1983-84. Corresponding foreign exchange earnings declined from Rs 37 crore to Rs 24 crore. Exports in the first 11 months of 1984-85 amounted to 24,145 tonnes valued at Rs 24 crore as compared to 26,708 tonnes valued at Rs 23 crore in the corresponding period of the previous year.

The Central and state governments are reportedly contemplating a number of measures to help the industry and to protect the interests of the four lakh workers employed by it. With effect from March 1985 the price of husk has been increased by 50 per cent . Amendment of the Husk Control Order is also being considered. In this connection, the Kerala government has proposed that one-third of the total husk available at the retting stage may be sold at a price fixed by the government as usual and the remaining quantity may be allowed to be sold in the open market. The state government claims that about 50 per cent of the workers engaged in the coir industry have been brought into the co-operative fold under its heavily subsidised scheme for the purpose. The number of co-operative societies formed under the scheme is put at 466. Hence, while amending the Husk Control Order, the interests of these co-operatives cannot be overlooked.

## *Tea*

### Dwindling Exportable Surplus

THE Budget for 1985-86 has much to cheer the tea industry which has been in any case having a good time, in terms of both production and earnings, since 1983. In fact the incentives offered in the Budget have exceeded the expectations of the industry. The Budget proposals for 1985-86 permit tea companies to deduct upto 20 per cent of their profits for investment in approved development projects, after first depositing the amount in a special account with NABARD. The details of the working of the fund are yet to be worked out. According to the latest thinking in the Commerce Ministry, the special account with NABARD may be made effective for a period of five years. The date by which this tax-free deposit is to be made and other details are being worked out by the income-tax department to frame the relevant rules.

The government of West Bengal has also proposed certain measures to help the tea industry in the state, which accounts for 25 per cent of total tea production in the country. The state government has reduced the sales tax on tea machinery and tractors from eight per cent to four per cent.

The Union Budget proposal to permit a deduction from the profits of tea companies is intended to help the tea industry to generate more internal resources for investment in new machinery, fresh plantation and replantation. It has been stipulated that withdrawals from the account will be allowed only for specified purposes in accordance with schemes to be approved by the Tea Board. The government wants the tea industry to formulate a long-term policy to increase production of tea so as to meet the rising domestic demand and maintain present levels of exports.

Production of tea had declined from 570 mn kg in 1980 to 560 mn kg in 1981. It stagnated at 561 mn kg in 1982. Thereafter it rose to 589 mn kg in 1983 and further to 644 mn kg in 1984 against the targeted level of 625 mn kg. Export earnings from tea soared to an all-time high level of Rs 750 crore in 1984-85 from Rs 530 crore in 1983-84. Thanks to rising world prices, unit value realisation was much higher in 1984-85, while the quantity exported was only about 15 mn kg more than the 1983-84 level of 200 mn kg. Domestic prices have also ruled high during the last two years, resulting in bumper profits for tea companies.

Government policy with regard to export marketing of tea has also helped the industry in getting a better price realisation. According to the tea marketing policy for 1985-86, it is proposed to export 220 mn kg out of the projected production of 655 mn kg.

If past experience is any guide, the boom phase may not, however, continue for long. In fact there is already a softening trend in international prices and the Commerce Ministry has had to lower the minimum export price from Rs 31 per kg to Rs 26 per kg with effect from April 29. The industry should, therefore, respond positively to the incentives proposed in the Budget. There is an imperative need to draw up a long-term investment plan to cover new plantations, replantation and modernisation.

It needs to be noted in this context that the production of 644 mn kg achieved in 1984, while it represents a significant improvement over the previous year, is much lower than the Sixth Plan target of 705 mn kg. Whereas the annual growth of tea output in the last decade works out to 3.4 per cent, domestic demand has been rising at the rate of 5.3 per cent per annum. Consequently, the quantity available for export has been steadily declining. The fear has been expressed that unless steps are initiated to increase production significantly, India might even find itself an importer of tea by the next decade.

## LETTER TO EDITOR

# National Campaign on Bhopal Disaster

THE Bhopal Poisonous Gas Disaster Rashtriya Abhiyan Samiti met in Bhopal on April 6-7, 1985 to chalk out a national campaign on the wider issues emerging out of the Bhopal episode. The Committee was constituted at the National Convention convened by the Zahreeli Gas Kand Sangharsh Morcha in mid-February this year in Bhopal which was attended by 65 organisations from 13 different states, working in the field of civil liberty and democratic rights, people's science, environmental protection, women's issues and cultural action.

The Rashtriya Abhiyan Samiti has decided that a nationwide programme be undertaken to force the government to take such steps against the US company, Union Carbide Corporation, and its Indian subsidiary, Union Carbide India, that both the companies may not be able to carry on their business any more not only in India but also anywhere else in the world. Such an uncompromising punishment will serve as a deterrent to all other pollution-causing industries all around the world.

To fulfil the above objective, a nationwide signature campaign on a memorandum to the Prime Minister has been started to press the following demands:

(1) Confiscate the entire property of the Union Carbide factory at Bhopal and its Research and Development Centre and guarantee that these shall not be allowed to operate again anywhere else in India.

(2) Provide equivalent and alternative jobs to all the employees of the Union Carbide factory at Bhopal in and around Bhopal city.

(3) Nationalise all Union Carbide factories all over the country, its regional and sales offices and all other properties without paying any compensation and make appropriate arrangements to protect human life from the possibility of any further dangers from hazardous chemicals in these plants.

(4) Take such political and legal steps against Union Carbide Corporation so as to force the company to pay a compensation, roughly Rs 6,000 crore, which will lead to the bankruptcy of the company.

(5) Scrap the judicial inquiry commission set up by the Madhya Pradesh government in view of its restricted jurisdiction and incapability to seek information from the Central government's departments and agencies, and immediately constitute instead an inquiry commission set up by the Central government under the Chief Justice of the Supreme Court. Widen the terms of reference to include the licence agreement, production process and hand-

ling of the aftermath, especially medical treatment and relief.

(6) Replace the Bhopal factory by a modern hospital to provide life-long treatment to more than two lakh gas victims and also by a rehabilitation scheme to give alternative jobs to the gas victims especially those whose reduced physical capacity does not allow them to return to their old jobs.

(7) Erect a national memorial at the site of the Bhopal factory in the memory of the disaster and set up a museum and a documentation centre on the lines of the Hiroshima Museum, in order to record information about all industrial disasters of the world.

The above memorandum will be submitted to the Prime Minister on June 6, World Environment Day, in Delhi by organising a rally. In addition to this the Rashtriya Abhiyan Samiti decided to observe May 3 to mark the beginning of the sixth month after the tragedy and to organise on this day demonstrations against all factories of Union Carbide in the country, its regional and sales offices and other centres. It was further decided to issue an appeal to all trade unions, peasant and student organisations to pass resolutions on May Day in support of the demand for nationalisation without compensation of all factories and other properties of UCIL outside Bhopal all over the country.

The Rashtriya Abhiyan Samiti has also declared that the people of India have an absolute Right to Safe Environment and a similar Right to Know. In this context, the Zahreeli Gas Kand Sangharsh Morcha alleges that Union Carbide and the government have acted in complicity with each other to deprive the people of both of these rights during the Bhopal episode. By suppressing information regarding the number of people who died due to gas leakage, chemical identification of the poisonous emission, effect on the air, water and food materials, post-mortem reports and medical reports of the patients, licence agreement, etc, Union Carbide and the government have given protection to each other misled the public and deprived the gas victims of scientific treatment. According to the Morcha's Technical Cell, the government has added to the misery and ailments of the gas victims by suppressing the fact of the presence of hydrogen cyanide and its role in causing disease and death through cyanide poisoning and also by refusing to give the antidote sodium thiosulphate injections. Similarly, the government refused to caution women against possible dangers to their foetuses during the first trimester of their pregnancy as a result of exposure to the gas and also denied advice to women regarding the need to avoid conception until de-toxification, thus endangering the future generation.

The Morcha also alleges that the government by suppressing information regarding the chemical identification of the gas and the state of health of the gas victims, is helping Union Carbide Corporation to get away with a reduced criminal responsibility in the compensation case in the US court.

The Morcha further points out that the government has tried to mislead the public regarding about a dozen instances of the leakage of hazardous chemicals since December 3, 1984 from the Bhopal factory and has also refused to declare the schedule of removal of such chemicals from the factory site. This act of the state government has been responsible for causing tension and keeping the people of Bhopal in a state of continuous scare.

# Living on the Brink

**Romesh Thapar**

WE are now moving into a situation where very soon we will not have a police force worth the name. The police revolt in Ahmedabad, and the vicious assault on a newspaper which was leading the campaign to expose police illegalities and the tie-ups between corrupt business and ruling Congress politicians, has sent shock waves through a startled Parliament. This is the culmination of a series of 'breakdowns' in the now misused law-and-order system, the last being the grotesque pre-Bluestar drama in Punjab.

The attack on individual journalists and photographers is naturally only an extension of the attempt to stamp out the truth about what is happening. In many ways, the press is responsible for allowing police-politician illegalities to escalate until anyone in uniform imagines that he has a right to treat citizens as if they were conquered peoples. It has failed miserably to play the role of a determined watchdog, and so many 'leaders' of the profession have, like ordinary politicians, sought 'suction' in the police system.

Repeatedly, serious observers of the national condition, including distinguished retired members of the police and para-police, as also of the numerous formations raised to support the police-system, have been warning us of the consequences of political interference and manipulation in these sensitive areas. The National Police Commission, prevented from completing its work by a corrupted and criminalised Congress party, has also reinforced this view.

There can be no denying that the *netas* of various ruling groups have set the worst possible standards for the services under their command. After all, the police in Gujarat—or Ahmedabad!—are not the first to batter the press. Politicians have been playing this game in almost every state (witness Bihar and eastern UP), and with the assistance of both police and gang leaders. If in Ahmedabad the politician-police gang up is close and intimate, it should not cause any surprise. Witness the ludicrous analysis of the Union Home Minister about foreign agents and what not.

And, incidentally, it is high time to tell the incumbents of the Union Home Ministry, past and present, that their theories of organised attempts to 'destabilise' the country are farcical. If there are any destabilisers around, they are largely composed of the incompetents and pig-heads who have allowed the police forces to become the wretched things they are. Gujarat's story is not different from any other—even mafia-controlled Bombay.

It required the terrible enactment of the post-assassination assault on the Sikh community in the Capital to investigate the snake-pit that is the local police and to begin a meaningful reorganisation of the force to ensure that such holocausts are not repeated—and it needed someone 'from the outside' to cut through the casteist tangles of formations that should long ago have been purged of these primitive emotions. How long it will take to complete the process is anyone's guess, for the local politicians are as active as ever serving their dirty interests.

It is astonishing how leading newspapers pontificate about the deplorable state of the police and, in the next dissertation, denounce the effort to enquire into the handling of casteist and communal killings, planned or otherwise. This living at many levels has also become a distinguishing mark of all strata of the urban population. At some point in our slide into chaos, a solid diagnosis of the sickness has to be done—and the citizenry had better become conscious of its own contribution to the chaos.

Populism is certainly taking its toll. Only the other day, we were adjusting to the crazy competition among Akali leaders to retain control of their extremist youth, as also to the strange obsession of the military to decorate themselves for police actions. Now we are caught in the web of so-called reservation and so-called anti-reservation trends (vitiated in a hundred ways) as if belonging to a particular caste is enough to ensure your progress through life, and we are confused because we know that the merit system is fast dissolving under a variety of 'fixing' which we tolerate. Even Calcutta, living or dying or plodding along, refuses to look at itself and will probably be called to vote in municipal elections now that the CPI(M) can wallop Rajiv Gandhi for his loose statements on the city.

In every successive situation or crisis, the voice of reason or rationality is becoming more and more feeble. Whether it is the politician or the social worker or the academic presiding over a troubled campus, the desire is to take a position that is easily communicated and popular. We are living on populist titillation, starved as we are of so many essentials of dignified living. All this puts a premium on turmoil, and, ultimately, violence.

Punjab and Gujarat, Assam too, have put the spotlight on the state of the police and the absence of any norms to condition the maintenance of law and order. From all accounts, it is becoming increasingly clear that the people throughout the country are deeply distressed by the insecurities that surround them today. The ruling parties cannot evade their responsibilities, or else a kind of chaos will take over, damaging normal political and economic life.

I don't think any country in the world, with the possible exception of those belonging to the communistic sphere, have as many non-military uniformed formations, although ours have the unique distinction of being largely packed with the alienated and unemployed who could claim a political godfather. It is here that a massive purge has to take place once the regular police force is reorganised and restructured, and made truly representative of our people. It is time the PM was reminded that we have an excellent pool of manpower in the 60,000 annual retirements from the armed forces. Why are we wasting them?

More than ever, the need to establish an Inter-State Council composed of the Prime Minister and the chief ministers, with the President presiding, as envisaged in our Constitution, is being felt. The problems that are surfacing in our new situation demand an all-party consensus in terms of those who exercise power in some region of the sub-continent. Why is there a reluctance to make our federal functioning more cohesive, more energetic, less controversial and devisive? Even official statements could be tempered more intelligently.

That the system of governance under which we have lived and progressed these 38 years needs considerable repair and innovation is widely understood. The danger signals are out because we are beginning to witness simultaneous eruptions at widely separate points, making it increasingly difficult to concentrate disciplining power.

# Memories of Bandung

### GPD

ON April 24, the thirtieth anniversary of the Bandung Conference of African and Asian states (and not 'Afro-Asian states'—the organisers of Bandung were rather particular on the nomenclature) was celebrated in Suharto's Indonesia. There have been two major conferences of the post-war world which are assured of a safe place in the history of the third world. One is the Asian relations conference that Nehru was instrumental in organising in New Delhi from March 23 to April 2, 1947. The other is the Bandung Conference in Soekarno's Indonesia. There was not much of African representation in Bandung because decolonisation of Africa began in earnest only in the sixties. Only five African states were present there. The other nineteen were Asian. But the numbers do not matter. It was the first and perhaps the last time that the African and Asian states, whether aligned or non-aligned, gathered together.

Bandung seems to be such an ancient past. How much the world has changed since is obvious from the fact that it was Soekarno's Indonesia in 1955, while in 1985 it happens to be Suharto's. Soekarno was not an ideal statesman. Nor can it be argued that his performance in terms of economic development was notably better than Suharto's. The hapless Indonesian masses are now caught in the trap of dependence and underdevelopment from which there seems little chance of escape. The difference between Soekarno's time and that of his successor consists in the resurgent character of Indonesian nationalism. It was still possible then to talk of 'imperialism' and, to borrow Panikkar's phrase, of "western dominance", a term which nobody would understand in Indonesia today.

Bandung was the first collective assertion of the young nations and ancient peoples that Asia and Africa represented. It must have also been a spectacular gathering. A suave Zhou Enlai, an ebullient Soekarno, a shade condescending but warm Nehru and a remarkable colonel of the name of Gamal Abdel Nasser make up a galaxy which a puny Reagan or a slavish Margaret Thatcher, a colourless Kohl or the so-called socialist Mitterand (why European politicians are referred to as socialists is a mystery) and others getting together cannot hope to match. They were giants of Asia and Africa. It was a new world which they led. Yet they were the inheritors of ancient civilisations. The white man had left or was about to leave these continents. Bandung seemed to announce the end of western dominance.

This is not to suggest that these statesmen gathered at Bandung with a very clear perspective. There was, for instance, Sir John Kotelawalla of Sri Lanka. He had tremendous problems with the term 'imperialism'. After all he had been knighted by the British crown. There was a stormy and apparently an endless meeting about the draft of the final Bandung statement. One of the problems which this drafting committee faced related to 'imperialism'. A group of statesmen led by Sir John Kotelawalla objected to the term. Like the contributors to the second volume of the "Cambridge Economic History of India", they seemed to be a little wary of this business of imperialism. Sir John thought of a brilliant idea. He argued that if the final statement has to refer to imperialism it must then refer to both imperialisms—imperialism of the West and the imperialism of the East (i e, east in European terms). You can see that neither Lin Biao, nor Mao, nor even Bettleheim can claim credit for inventing the notion of Soviet imperialism. Sir John was the author. Later writers have simply plagiarised from the great Ceylonese mind!

Anyway, there was Krishna Menon there. His name has become unmentionable in foreign policy parlance in this country. Some time ago we wrote in this column that Parthasarathy and his men are the inheritors of the Menon mantle. The number of friends who thought that we were attacking Parthasarathy was amazingly large! So you see, Menon's has become such a bad name. Be that as it may, while Menon's acerbic tongue is well known his diplomatic skills are not. He came out with a brilliant formulation, a perfect example of a (useful) Brahmanic exercise. He suggested that the final draft should refer to "imperialism in all its manifestations". Sir John was persuaded. Krishna Menon was not very kind to those who wanted to keep the flag of western dominance flying in Asia. He is reported to have said about the accepted phraseology that "we made them agree to something they do not understand". Krishna Menon was not very wrong. The Bandung spirit has gone sour precisely because over the years 'imperialism' has become respectable. Nobody would suggest that the LDCs must sever all connections with the West. That is not possible, nor is it necessary. But it requires a certain toughness to deal with the West. It also requires a perspective. The element of loot has not disappeared from the relationship of the West with Africa and Asia. The Bandung spirit has been killed in the sense that there are hardly any statesmen left in Africa and Asia who would recognise that the epoch of imperialism is not over yet.

It is not a question of loot alone. It is also a question of what these states are like and should be like. The Chinese can afford to take such liberties as they are taking because there is no imminent danger to their statehood either from within or without. There is scarcely an African-Asian state which does not face that problem today. It is true that it is partly the doing of what the ruling elites in these states have been doing. But that is not the whole story. It cannot be. There are also bigger actors. During the fifties there were some statesmen who saw clearly and vividly who they were. Bandung created the impact that it did largely because of these small number of people.

Bandung would also be remembered, we imagine, for Zhou Enlai's tremendous entry on the African-Asian scene. The suave Prime Minister took everyone by storm. He must have resented being introduced to people there by Nehru. Much is made of the unfavourable impact that Nehru's condescension at Bandung made on Zhou Enlai. Nobody knows. We would think that given the Chinese finesse and the surety of touch that a civilisation gives, Zhou Enlai must have taken it not only in his stride but perhaps also with that typical all-knowing smile. Zhou Enlai once remarked many years later that Indians continue talking of Everest with extraordinary fondness but do not even know what the peak was named in ancient times. Not that the Chinese had any name for it. They simply appropriated the Tibetan name. Anyway the point is that the man who went to Bandung in 1955 was a consummate diplomat. An inheritor of a revolution as also its maker was going to leave some impact, irrespective of who introduces him, to whom and where.

As the memories of Bandung fade, what is going to be lost is the elan of early nationalist leadership of Asia. It is not for the Suhartos of the world to understand it, let alone celebrate it. The thirtieth anniversary of the Bandung celebrated there was a useful reminder of what Asian (and African) states have lost over the last thirty years and precisely that the celebrations in Bandung missed.

# Innovations Begin to Pay

**Hansavivek**

*WIMCO* started manufacture of matches in 1923 and is today the country's largest manufacturer. It has spread its activities too. Paper and chemicals were the earliest diversifications, based on matches. Today Wimco is also engaged in the manufacture of metal anodes, processed fruit juices and concentrates, packaging materials and machines. It is the largest exporter of tropical fruit products from India and is in the forefront of farm forestry and horticulture. The company has turned in good working results for 1984 with sales, profits and margins higher than those of the previous year. Turnover has increased from Rs 75 crore to Rs 85.30 crore and gross profit from Rs 5.34 crore to Rs 8.29 crore, reflecting a significant improvement in profit margins. Although tax liability has claimed considerably more, net profit is still Rs 3.83 crore compared to Rs 2.32 crore of the previous year. Dividend has been raised by two points to 20 per cent and is covered 2.27 times by earnings against 1.52 times previously.

The labour problem at Ambarnath unit was amicably settled in September last and normal operations have since been resumed there. The production of matches and chlorates at Ambarnath was adversely affected for the first nine months of the year due to the closure. The metal anodes project went into commercial production and substantial orders from leading caustic soda manufacturers have been executed. The results obtained by the customers using the company's metal anodes have been in line with the guaranteed performance and are comparable with international standards. The operations of processed food activity were adversely affected due to an unusually poor mango crop. However, timely modernisation and upgradation of technology resulted in a wider product range and helped the company to tide over a difficult situation. Considerable orders are in hand and the prospects appear to be good for the current year. The engineering division showed a marked improvement in its working. It executed an export order for packing machines from USSR. Amongst its customers for the new Expresso range of machines, built under licence from AR Packaging Systems, are well known companies such as Lipton and HMM. The management expects the demand for such systems packaging machines to add greatly to the conventional range of fillers and other packing machines. The forestry operations started yielding positive results during the year. Adequate provision for nursery development and multiplication has been undertaken. R and D programme for rapid multiplication of existing and new species and varieties has been undertaken in collaboration with Wimco Seedlings. Extension work for the horticultural development and supply of tomato and mango required for the processed food activity has also been taken in hand. The total value of exports was Rs 11.8 crore. There should be an improvement in the export performance during 1985. During this year, Cleanfoods Corporation as well as A R Packaging Systems have become subsidiaries of the company. The directors view the current year's prospects for the company as good due to favourable market conditions and a comfortable order position. Moreover, the technological innovations and rationalisation measures in the traditional activities have started yielding results.

*TRIBENI TISSUES* has turned in good results for 1984. Production, sales and profits have all been higher compared to the previous year. Production of paper was 13,283 tonnes against 10,958 tonnes in 1983, sales in volume terms amounted to 13,366 tonnes against 11,042 tonnes and in turnover they were Rs 30.39 crore against Rs 23.60 crore. Turnover increased with improvement in the offtake of cigarette tissue and considerable increase in sales of commercial grades with a reasonably good product-mix. Gross profit increased from Rs 3.40 crore to Rs 4.68 crore, reflecting enhancement of profit margins. With both depreciation and taxation requiring more, however, net profit slipped from Rs 1.68 crore to Rs 1.37 crore. The directors have recommended a dividend of 18 per cent on the capital as enlarged by a one-for-four bonus issue against 21 per cent paid last year on old capital. This is slightly short-earned. A sum of Rs 30 lakh has been withdrawn from the general reserve to enable payment of the proposed dividend. Last year's distribution was covered 1.26 times.

These results have been obtained in spite of a serious crisis in the procurement of raw materials like jute cuttings and sann hemp. Jute cuttings became so scarce that the company could build only a small inventory at a price as high as Rs 12,000 against the actual price of Rs 3,000 per tonne in the previous year. The area of cultivation of sann hemp in UP was limited resulting in lower quantum of production with a consequent rise in price upto Rs 7,500 per tonne. The problem of raw material availability still persists and the company has taken some innovative measures to tide over the situation to an extent possible. There was also the problem of availability of coal, as the coal received by the company had an ash content of as high as 40 per cent. Besides, power supply was erratic which affected production many a time. S Boothalingam, Chairman, who is relinquishing his office as Director and Chairman of the company at the conclusion of the annual general meeting, holds a "robustly optimistic' view about the company's future. N G Choudhury, who has been Managing Director since 1979, will be the new Chairman. The company has set up, at considerable expenditure, an effluent treatment plant at its factory to purify the water which could otherwise pollute the neighbouring farm lands. For the farmers this has turned out to be a boon. Realising that the treated water was fit for irrigation, the company released it to a large paddy growing acreage. Today the farmers happily receive free irrigation water round the year.

*CENTURY SPINNING AND MANUFACTURING COMPANY* proposes in due course to enter into the business of exploration and production of oil and gas either in collaboration with some foreign companies or on its own. The management feels that in view of the changing industrial profile of the country, the energy technology and ocean engineering industry offers good scope for possible diversification, particularly in view of the Central government's policy to encourage Indian companies to invest in the oil field sector. For the present, the company intends to confine itself to the business of owning and chartering operating rigs and associated equipment for offshore oil exploration. As a first step in this direction, the company's Memorandum of Association is being suitably altered to cover these activities.

The company's shipping division is seeking permission of the government to acquire a second-hand edible oil carrier of 6,400 DWT built in 1981 in Japan. The pulp and paper division started initial trials in June/July 1984 and, after overcoming teething troubles, commercial production of rayon grade pulp was started in September last and that of paper soon thereafter. Because of deficiencies in certain plant and machinery coupled with the undue delay in deliveries of some of the machinery and equipment by the suppliers, the present production is approximiately 50 per cent of the rated capacity. Steps have been taken to overcome the problems and the management expects that by the middle of 1985 full production of both the plants will be more or less achieved. While the quality of pulp is not as yet satisfactory, that of paper has been well received in the market. Efforts are being continued to bring the quality of pulp to the approved standard. The start-up of the Manikgarh cement plant has been delayed due to serious delays by several Indian suppliers. The imported plant and machinery, however, were received more or less in time. The company is also awaiting clearance of the Central government under the Forest (Conservation) Act to start mining operations. The plant is expected to be ready for commissioning during the second quarter of 1985.

The company has shown poor results for 1984 with a drop in gross profit from previous year's Rs 31.96 crore to Rs 22.06 crore even though turnover rose from Rs 214.72 crore to Rs 245.34 crore. These figures disclose a sharp dimunition of profit margins. In spite of a saving in tax, which claimed Rs 6.5 crore last year, net profit is Rs 8.19 crore compared to Rs 14.81 crore of 1983. Dividend has been maintained at 24 per cent and is covered 2.13 times by earnings as against 3.87 times previously.

The company could effectively meet the recessionary trend in the textile market, caused by stiff competition from the powerloom sector, by concentrating more on exports. The company's textile exports amounted to over Rs 42 crore as against about Rs 25 crore in the previous year. The phased programme of renovation and modernisation is being speeded up. The yarn prices remained depressed and the offtake of rayon yarn was not satisfactory till the third quarter of the year. There has been a gradual improvement in the offtake and selling prices of yarn thereafter. Demand for tyrecord and fabric continued to be low and the future outlook of these products seems to be bleak. The rayon industry has made several representations to the government for fiscal and other reliefs, but the government has not so far responded positively. With a view to facilitating a solution to the problems arising out of the declining demand for rayon tyrecord and the uneconomic working of the tyrecord plant, an agreed scheme of voluntary retirement was introduced and 404 workmen voluntarily retired. The working of the chemicals division and salt works was generally satisfactory. Despite stiff competition, tyre yarn and fabric worth about Rs 212 lakh were exported during the year.

Century and Maihar cement divisions produced 8,00,400 tonnes and 7,31,606 tonnes of cement against 8,16,510 tonnes and 6,95,407 tonnes, respectively, in the previous year. The power situation continues to be unsatisfactory and the quality of coal has further deteriorated due to increase of ash and shale content in the coal. The profitablity of both the divisions was adversely affected due to a steep rise in the cost of production and continuing slack offtake of non-levy cement resulting in lower sales realisation.

*USHA MICROPROCESS CONTROLS,* which brought in the Eagle and Alpha series of computers and was responsible for bringing down the prices of computer systems to ⅓rd their existing levels, is now going in for large scale expansion in the field of large computer systems, computer peripherals, office automation and electronic PABXs. According to the company's Vice Chairman, Vinay Rai, the company is poised for rapid growth with a turnover target of over Rs 100 crore by 1990. It has already paid dividends of 10 per cent and 15 per cent in its very first two years of operations and it recorded a gross profit of Rs 47 lakh on a sales turnover of Rs 229 lakh in 1984.

The computer industry is poised for rapid growth. The new import policy would go a long way towards helping increased production. The company is not afraid of foreign competition, as it has the best of technology available in the world. It is also in the process of finalising a joint venture with a Norwegian consortium for large export of software from this country. Usha Microprocess is promoted by the Rai Group which has a controlling interest in over 20 different manufacturing and marketing units in fields as diverse as steel, defence equipment and electrical goods and electronics. Among its sister concerns is Usha Rectifier Corporation (India), a pioneer in the field of semiconductors, electrical and electronic equipment. The company is entering the capital market with a public issue of 10.20 lakh equity shares of Rs 10 each at par. The issue will open on May 10, 1985. The issue is being managed by the Merchant Banking Division of Grindlays Bank, New Delhi, and Canara Bank is advisor to the issue.

# New Policy Changes Acknowledge Auto-Industry as Vital to Economic Growth

## Ashok Leyland Limited

### Speech by the Chairman **Mr Mantosh Sondhi** at the Thirty-sixth Annual General Meeting on April 23, 1985

Ladies and Gentlemen,

IT gives me great pleasure to welcome you to the Thirty-sixth Annual General Meeting of your Company. The Report of the Directors and the Audited Accounts for the year ended 31st December 1984 have been circulated and, with your permission, I shall take them as read.

**REVIEW OF OPERATIONS**

1984 has been a year of unprecedented crises for our country—the tragic assassination of the Prime Minister, Mrs Indira Gandhi brought to a sudden end a remarkable era. It is a matter of profound relief that the basic national values asserted themselves through the democratic process leading to a smooth and stable transition of governmental power. All of us must wish the new Government under the dynamic leadership of Shri Rajiv Gandhi, well in its endeavours.

The events on the national scene cast their gloomy shadow on the road transport industry also. Troubled conditions in economically strategic states exerted an adverse influence on road transport operations. Though the economic revival in 1983-84 was robust, growth in 1984-85 has been on a low key. Agricultural production which showed a strong performance in 1983-84, had only a marginal growth in 1984-85. The economy, though maintaining plan growth rate on average, did not offer adequate market pull for the road transport industry which was beset with a trying combination of adverse factors affecting the viability of operations from 1982 onwards.

The signs of market recovery noticed in the early part of 1984 could not, therefore, be sustained, and the year ended with a lower total industry volume which was about 7% less compared to the previous year.

Against this adverse background, it is a matter of satisfaction that your Company effected a marginally higher sale of 14425 vehicles compared to 14372 vehicles in 1983. While a higher domestic sales volume was achieved despite reduced market demand, export markets continued to cause concern in the absence of structural support in terms of long term bilateral deferred credit arrangements particularly with the Third World and developing countries.

Apart from the adverse market factors, your Company had to contend with a severe cyclonic storm which lashed the Madras coast on 11th November 1984 as a result of which production at the Ennore Unit was seriously dislocated.

Gross turnover was lower by 4% due to a shift in the marketing mix in the prevailing environment, towards lower priced models.

The decline in turnover posed a major managerial challenge in the face of continual escalation in input costs. As you are aware, your Company effected a modest price increase in April 1984 after three years of voluntary price discipline. The extent of the pricing action was limited in view of the partial withdrawal of excise duty concessions in the 1984-85 budget. The impact of even this small increase was significantly eroded with further escalation in costs of key input materials like steel and other metals during the year. Due to depressed market conditions, your Company did not take any pricing action, even partially, to cover the cost increases. Your Company could achieve a profit before tax of Rs 6.49 crores as compared to Rs 6.92 crores in 1983 through rigorous control of manufacturing and other expenses, and by a significant reduction of interest charges. Having regard to the healthy funding profile and intrinsic strengths of your Company, the Directors have recommended a dividend of 18%, at the same level as in the previous year, on the enhanced share capital of Rs 1,813 lakhs, subsequent to the first conversion of Series III Debentures for shares entitlement on November 1, 1984.

## OUTLOOK FOR 1985

As you are aware, 1984-85 marks the end of the Sixth Five Year Plan. The road transport industry which started on a buoyant note in 1980-81 has undergone a series of travails during the plan period and the overall environment in the transport industry cannot, perhaps, be more sobering than it is now. While the need to stimulate the vital infrastructure has been acknowledged in various governmental and quasi-governmental forums, the only tangible action was the rather shortlived excise duty reduction.

In the wake of the downturn in vehicle market in 1984, and the slow momentum in the economy, I am inclined to take a cautiously optimistic view of the prospects for this year.

The Seventh Plan aims at a growth rate of 5%. If this rate, is indeed, attained each year on a larger GNP base as obtaining at the end of Sixth Plan, there should be a considerable growth momentum in the economy.

Your Company has plans for product improvement and diversification which aim at consolidating existing markets and penetrating new markets with superior product attributes, traditional high product quality and application-oriented design. These should considerably strengthen your Company's market position.

I must assure you that your management would continue to follow the strategy of strict control on operating costs and optimum utilisation of all available resources with the objective of trading profitably. However, with the recent increases in prices of steel, tyres and tubes and the overall budget-induced increases in costs of various inputs, it has become inevitable to increase vehicle prices by about 8% to relieve the pressure on margins.

As I touch upon these prospects for your Company in the short term, I would like to share with you my thoughts on the contours of an emerging techno-economic environment. I will confine my comments to the two essentials of economic policy and technology policy.

## LIBERAL ECONOMIC POLICY

The Finance Bill 1985 and the new Import-Export Policy clearly indicate that the present Government is intent on giving a new direction to the economy, and as a precursor several policy changes have been announced to stimulate corporate growth. Some of these measures are exclusive to the automobile industry.

Notable among the changes is the policy on broad-banding of licensed capacities in terms of generic definition of 4 wheelers and 2 wheelers. The policy theoretically allows a 4 wheeler manufacturer flexibility to manufacture any type of car, jeep or commercial vehicle.

Prima facie, the policy needs to be welcomed as established companies can diversify to utilise available infrastructure while new companies can revamp and reorient plans to match market potential before committing investments irrevocably. More intense competition could assure greater choice for the consumer, while overall market size itself may increase with new products creating new markets. The significance of the policy change, to my mind, lies in the underlying acknowledgement that structural redefinition of industry is vital to industrial growth.

The other major change pertains to the concessional rate of customs duty for import of components for fuel efficient commercial vehicles. Import of components by ancillary manufacturers catering to manufacturers of fuel efficient commercial vehicles, would also attract the concessional customs duty. The increase to Rs. 100 lakhs of the assistance now available under the TDF Scheme is very welcome. These moves in combination have the potential for supporting effectively the proposed technological upgradation of the automobile industry.

While appreciating the spirit and scope of these changes, one cannot escape observing that these are skewed in terms of stimulating the supply side. The more important aspects of end user needs and viability have not received the attention they deserve. The typical road transport operator has, in fact, slipped into a more unenviable position with escalation in prices of petroleum products, increase in excise duty on commercial vehicles and costs of vehicular inputs and spare parts.

While it may be argued that increased costs could be covered with a hike in freight rates, it is not easily achievable in practice. The socio-political compulsions on public transport systems preventing increase of fares are well documented. The private trucking industry though free of such compulsions is subject to intense competitive pressures as overaged and second hand vehicles which are operated almost indefinitely undercut freight patterns. Freight rates themselves are subject to cyclical and seasonal patterns and cannot be sustained with administered freight increases as in the case of monopoly transport systems such as the Railways.

The problem of generation of surpluses in road transport industry is indeed real, eating into the vitals of this crucial economic activity. Durable steps must be initiated within the framework of the fiscal policy to alleviate the problems.

The focus of such approach should be on trust-based financing of road transport operations. Despite the close relationship between the transport industry and banking systems, the needs of the former are met only perfunctorily. At most times there is a suspicion in the banking system that recoveries from transport loans are unlikely to be good. It is necessary to banish the archetypes and conceive a radical reorientation of fiscal and monetary policies towards this sector.

Firstly, the exigencies for creating an apex financing body for transport operations can no longer be ignored. Such a move would be the first step in establishing the necessary linkage between financing and operation of vehicles. The traditional banking system which has already a wide lending portfolio cannot muster the organisational infrastructure necessary to develop such linkages.

Secondly, the concept of limiting priority character of lending to a fixed fleet size should be dispensed with. Regardless of fleet size, road transport operations generate grassroot employment and entrepreneurship signifying the quintessence of our socio-economic philosophy.

Thirdly, the period of recovery should be refixed at 6 or 7 years taking into account the prevailing high levels of capital requirements and interest charges and low levels of business returns. The existing period of 3 or 4 years is not only unrealistic but is in itself a compulsion for erratic repayments.

Fourthly, a more direct rapport should be established between banking institutions, or the apex body when set up, and the hire purchase companies. Hire purchase companies have built up over the years a responsive field mechanism for sustained contact with transport operators, which incidentally, is an area of weakness for the banking system. Despite this, hire purchase operations have not grown to potential due to high effective rates of interest which the hire purchase companies are forced to charge due to non-availability of low cost funds. A sort of quid pro quo by which concessional rate of finance is made available to hire purchase companies with a franchise for lending and recovery on behalf of the bank deserves to be considered.

## EMERGING TECHNOLOGICAL DIMENSION

The industry and the Government are indeed in total agreement that the level of technology in the automobile industry must be substantially upgraded. Liberal licensing of collaborations for modern automobile technology and the sharp pace of implementation of various projects support the point.

As I mentioned earlier, the recently announced broad band licensing policy gives a further fillip to bringing in modern technology to cover hitherto neglected market slots. While appreciating the inevitability of this growth direction, your Company will need to be wary of the temptation to enter exotic market slots merely on import crutches without either durable market potential or firm commitment to an indigenisation programme. Your Company which has a proud manufacturing record of over twenty-five years considers establishment of manufacturing capability as the sine qua non of any product diversification move.

Your Company has, over the years, developed considerable technological expertise which has gone into development and perfection of commercial vehicles appropriate to India and other developing countries. Future product diversification can only be sensible when tested against the corporate tenet of absorbing and indigenising the imported technology in an acceptable time frame.

In this light, may I assure that your Company is actively exploring such of product diversification moves that can effectively utilise the emerging environmental opportunities and the existing internal strengths.

## PRODUCT PLANS

The policy of sustained product development to which your Company always subscribed has been a source of immense strength in meeting the vicissitudes of market during the recent years. It is significant that your Company has strong product strength in the two areas where Government has recently announced concessions in excise-duty. I refer to the vehicles with 3-axles and those with turbo-charged engines. Indeed your Company is the only one in India manufacturing multi-axle vehicles. The reputation of the products for their technological superiority and operational reliability and durability will continue to be nurtured most assiduously by your Company. A number of product plans have been drawn up to meet the requirements of a competitive market. Apart from consolidating the product strengths and market standing in traditional truck and bus markets, plans are afoot to realise new applications.

As you are aware, the Company's expansion programme to achieve a capacity of 40,000 vehicles by 1987 had to be considerably slowed down in the face of depressed market conditions. Over the past two years investments had been reshaped or halted to ensure an optimal funding profile and streamlined operations to face the adverse market conditions. This also provided the Company an opportunity to reappraise the long term technological and product options. Your Company considers that the core of future product development and diversification must pertain to development of modern, fuel efficient, weight effective and reliable engines which can meet the technological requirements of the 90s. The engine range would pave the way for introduction of a diversified and technologically up-to-date product range.

I am happy to inform you that after an extensive appraisal of reputed overseas engine/vehicle manufacturers' offers, your Company has entered into a technical collaboration agreement with Hino Motors Limited, Japan, for manufacture in India, of their 'W' series of engines. The engines employ the latest state-of-the-art technology and offer a characteristically high level of fuel efficiency. With a power band extending from 70 to 175 HP, Hino engines would be an invaluable asset in future product diversification. An application has been submitted to the Government seeking approval of this agreement. Your company will, in due course, firm up investment plans for this project. There would, no doubt, be an emphasis on assimilating the best of Japanese manufacturing technology in this venture. To my mind, it is of considerable strategic significance that finalisation of this crucial collaboration should coincide with the reactivation of expansion programme. With the availability of greater product options, this phase of growth would be qualitatively different ensuring a technological lead right into the nineties.

## DIRECTORS

Mr P D Plant resigned from the Board and in the casual vacancy caused by his resignation, Mr C J S Woodwark was appointed to the Board. I would like to record our appreciation of the advice and assistance given by Mr Plant during his tenure on the Board.

## ACKNOWLEDGEMENTS

I would like to record our gratitude to British Leyland plc. and Land Rover-Leyland Group for their continued active support and assistance in our developmental plans. I would also like to record our sincere thanks to the Government of India, State Governments particularly of Tamil Nadu, Rajasthan and Maharashtra, financial institutions and our bankers for their continued support and encouragement.

1984 has been another year of challenge for your Company. Our special thanks are due to our employees for their loyalty and commitment which has enabled your Company to face these challenges with confidence.

We are grateful to our dealers and our suppliers for their unfailing co-operation. Finally, I would like to thank all of you, our shareholders, for your continued keen interest in the affairs of the Company and in affording me an opportunity to share some of my thoughts as your Chairman.

*Note: This does not purport to be a record of the proceedings of the Annual General Meeting.*

### ANDHRA PRADESH

# Eye-Wash of 'Patta' Distribution

**M Shatrugna**

THE attack on harijans by caste Hindu landlords on February 14 at Moogavada village of Punganur taluk in Chittoor and the failure of the authorities to provide security to the affected is yet another incident in the growing atrocities on weaker sections in the country. Though the incident did draw some attention in the local press, adequate importance has not been given to the developments. To fill this gap a Fact Finding Committee (FFC) constituted by Salaha (Forum for Legal Assistance and Education) visited Punganur and Moogavada village on February 20 and furnished a report.

Punganur taluk, located to the west of Chittoor district bordering Karnataka, comprises the main parts of the erstwhile zamindari. It has six revenue firkas. An interesting feature of Punganur taluk is the vast areas of public lands over which stand thousands of tamarind trees. There is no systematic survey of the tamarind trees on public lands and it can be assumed that the actual number may be at least double the recorded number. There are villages where the total number of tamarind trees may exceed five hundred. With the rising prices of tamarind, the trees have acquired growing significance in the structure of village income distribution. The yield from a tree ranges from 150 kgs to 600 kgs of raw fruit and at current price it would mean Rs 500 to Rs 2,000. Yet the produce of these trees referred to as 2C trees in government parlance is auctioned for a song, benefiting the rural rich. For instance, the fruit of the 350 trees identified in Ramasamudram firka was auctioned for Rs 1,500 this year. With the existing scarcity employment and low wages in the region, a tamarind tree on hand would mean as much as regular employment on a farm. Moogavada is a village of five hamlets located on the Punganur and Bangalore highway, about eight kms from Punganur and about the same distance from Ramasamudram, the firka headquarters. Moogavada is particularly rich in its tamarind trees. The whole approach to the village gives an impression of a large tamarind grove. At least half of the estimated five hundred tamarind trees in the revenue village are on the public lands.

The potential of the tamarind tree as a means of providing the means of livelihood of the poor was officially recognised by the government in late 1970s when it tried to use the allotment of tamarind trees as incentive for inducing the poor to undergo sterilisation. A beginning was made in Mugavada when N Muneppa and seven other harijans were given 'pattas' on two tamarind trees each for undergoing vasectomy operation in February 1978. Besides, 45 other harijan families were allotted one tamarind tree each. These harijan households enjoyed the produce of the trees for two years, but in the third year in 1981, D Thimma Reddy and three other landlords brought a stay order preventing the harijans from collecting the produce from the trees. Helpless against the court stay order and the absence of any legal aid the harijans gave up collecting the produce from the trees. The caste Hindu landlords not only succeeded in denying the tamarind to the harijans but also imposed a fine of Rs 5 on anyone collecting dry twigs or ripe fruit falling from the trees.

Two years ago the harijans formed the Ambedkar Yuvajana Sangam with the main aim of working unitedly to improve their lot. The Sangam opened its membership later to other castes including Valmikis, barbers and dhobis. One of the main issues before the Sangam, right from the beginning, was regaining 'pattas' over the 2C tamarind trees. Repeated representations were made to the entire hierarchy of the revenue administration right upto the District Collector for regaining the already allotted trees and the grant of fresh 'pattas'. Their efforts started bearing fruit when the revenue authorities of the taluk ultimately conceded the demand after ascertaining from the landlords that they had no known claims either in the form of court orders, settlement claims or petitions.

### ALLOTMENT OF PATTAS

Accordingly, on January 16 this year the Revenue Inspector, assited by a clerk, visited Moogavada and distributed 'pattas' on 176 tamarind trees spread over the five hamlets of the village to 142 weaker section households. Each 'patta' carried the number of the tree allotted. Of course, not every tree allotted was capable of improving the income of the poor. Some of the trees allotted were a mere eye-wash, and were not capable of bearing any fruit. It was somewhat reminiscent of the 'pattas' over barren land declared as surplus. The harijans and the few other weaker section people who received the 'pattas' for the trees were aware of this, but they contented themselves with gaining rights over some tamarind tree rather than none.

After the allotment, the ryots who earlier had given their 'consent' on the trees could not reconcile themselves to the fact that the poor could also have rights over property, however meagre. For generations the fruits of these public trees had been theirs for a song. Year after year, there would be a 'thandora' (announcement) of auction. The village Karnam, a Brahmin, would offer the produce of the trees for a paltry sum at the firka auctions and the ryots would share the trees for collecting the produce by paying a small sum as a consideration for the services of the Karnam. Some of the big landlords like Chennamagari Chenna Reddy, Doddapagari Venkata Reddy and Ramakkagari Chenga Reedy would get as many as 30 to 80 trees as their share. Besides they were the main collectors of tamarind in the village for trade. The harijans were confined to working as labourers in collecting the produce from the trees at a wage rate of Rs 4 for men and Rs 3 for women.

Allotment of 'pattas' to weaker sections on tamarind trees obviously had an impact on class relations in the village. The 'rich' pattadar was seen as a threat to the domineering position of the landlord. This is something the landlord could never accept. The ryots were ready to take the law into their hands to maintain their supremacy. As a first step to meet the harijan challenge, they called for a meeting of the Ryotu Sangam, an association representing their interests. Chennamagari Thimma Reddy, Ramakkagari Venkata Reddy and Gundlapalli Narayana Reddy mobilised ryots from different parts of the taluk for the meeting. Cherala Ramalinga Reddy and others addressing the meeting exhorted the ryots to check the activities of the harijans and warned that allowing agricultural labourers to exercise their right over the tamarind trees would spell disaster to their own properties. The meeting unanimously decided to prevent, if necessary by force, the harijan and other weaker section households from gathering the produce from the 176 tamarind trees.

The Ryotu Sangam's decision unnerved the harijans. A meeting of the Yuvajana Sangam was called on February 11. The meeting discussed the Ryotu Sangam's decision and acknowledged the impossibility of individual households collecting the produce from the trees for which they had received 'pattas'. It was decided to collect and dispose of the produce from all the 176 trees collectively after retaining a portion to be shared for domestic consumption. In view of the threat from the landlords, it was decided to gather the produce without further delay. A strategy was worked out to mislead the ryots. The strategy was to announce publicly that the produce would be collected from February 14 onwards but actually to carry out the operation a day earlier. It was further decided to seek police protection. On February 12 representations were sent to the Tahsildar at Punganur through advocate Suryanarayanachari seeking police protection. Though the Tahsildar 'directed' the SI to proceed to Moogavada, barring a head constable there was no one in the police station to implement the order. Desperate requests were made once again on the 13th for police help without success. As planned, on the 13th the pattadars started collecting the tamarind in a group from a tree allotted to them. Some ten persons climbed the tree and about fifty persons were ready to gather the fruit from the ground. It was meant to be a swift operation without giving scope for the landlords to intervene.

But the operation was not that simple, as there was a division in the harijan ranks. A small faction of 10 households was aligned with the landlords. Apart from supporting the landlords, they were also serving as informers. Naturally the strategy failed. Within an hour of the commencement of the harvesting, the ryots led by Ramakkagari Sankara Reddy, Muniramappagari Ramakrishna Reddy, D Ramasubba Reddy, D Venkata Reddy, M Reddeppa Reddy and fifty others, including some women came and forcibly stopped the collection. The expected police help did not arrive and the harijans were forced to stop their rightful operation. Frantic efforts were made to get the police help once again, but none came.

### ATTACK BY LANDLORDS

In the meanwhile, the ryots had started mobilising their supporters from different parts of the taluk. Razak of Palamaner, a tamarind contractor and 'controller' over a large number of 2C tamarind trees in the taluk, Yelaktur Appoji Reddy, Rachepalli Ajja Reddy, Punganur Krishnama Raju, Mittapalli Ipole Narayana Reddy, Sarpanch Ramakrishna Reddy—a landlord-contractor combine—actively mobilised hired men from the neighbouring villages, and goondas from Punganur and Palamaner. Anticipating trouble the harijans withdrew to their hamlet and were scared of moving out for fear of reprisals. While they waited hoping for police protection throughout the night, the landlords used the cover of darkness to mobilise more people "to meet the harijan challenge". Mobilisation was done secretly so as to launch a surprise attack. While Razak pressed his lorries into service for the purpose, Sarpanch Ramakrishna Reddy supplied his tractor. Realising that their low social background would come in the way of their getting the attention of the authorities, the harijans had sought the services of a voluntary organisation, Rural Education Society (RES), and an advocate, Suryanaryanachari, Punganur Taluk Secretary of CPI. The advocate and the RES representatives went to Moogavada on February 14.

Around 10 am, a group of ryots led by Razak and Rachepalli Ajja Reddy trooped into the harijan hamlet with the apparent purpose of negotiating a compromise between the weaker section 'patta' holders and the ryots, but it transpired later that they were only trying to gain time for mobilising more men from the neighbouring villages for an offensive. During the 'negotiations' the landlords' representatives referred to 'stay orders' of the court and suggested that the pattadars give up their futile efforts to collect the produce. Instead they suggested cash compensation. The harijans were not convinced about the so-called court orders as it was not long ago that the landlords had said that they had no rights over the 176 tamarind trees. As the talks failed, the ryots left the place and returned with a thousand men armed with sticks, daggers and country bombs an hour later. Advocate Chari had also arrived by that time.

The ryots converged on the harijan hamlet from one side fully armed. The unarmed harijans numbering about 150 gathered on the opposite side not knowing what to do. It was noon and there was no sign of any police. At about 12.30 the sub-inspector of Punganur accompanied by an aged constable arrived. The arrival of the unarmed SI emboldened the landlords to launch a full-scale attack. Sensing the tense situation, the SI persuaded the harijans to move to a safer place, but in the process unwittingly cleared the path for the landlords to occupy the area. Suddenly three bombs exploded and the panic stricken harijans ran helter-skelter. In the stampede many fell down and became targets of the landlords' attack. Advocate Chari fell and was beaten with sticks and stones. As a bleeding Chari ran for his life, a dagger scratched his right side. Many harijans were beaten up with sticks and stones. An old man was beaten till he became unconscious. Even a week later he and another person were convalescing in the Punganur hospital when the fact finding team visited them on February 20. The hirelings did not spare even the women. Papakka was beaten up and her mangalasuthram snatched away. Rathnamma was attacked with sticks.

The most humiliating treatment was, however, meted out to advocate Chari who had gone to the rescue of the harijans. He was stripped of his blood stained clothes, paraded in his underwear, pushed into the village tank and forcibly confined in a house. The feudal fury was let loose on everyone who intervened. After Chari, they attacked the SI. He fell unconscious and was carried to a nearby village. The constable ran away to some other village for shelter. The SI on regaining consciousness reached Ramasamudram, engaged a vehicle and reached Palamaner from where he requested for Reserve Police force for Moogavada. The police men reached Moogavada later in the evening. The advocate was released from wrongful confinement and was sent for treatment in Punganur hospital. The presence of the police force did not mean that the harijans could collect the produce from the trees. Strangely, the Tahsildar advised the harijans and other pattadars to wait till February 21 for the execution of the government order. When the FFC team met the Tahsildar on February 20 at Punganur, he swore that he would see to it that the harijans got the produce from the trees allotted to them the next day. But the committee felt that the Tahsildar was only playing for time.

### FEUDAL REPRISALS

The attack on February 14 was only the beginning of feudal reprisals against the weaker sections. The reprisals were swift and ruthless. From that day none of the members of the harijan and Valmiki households, except for the ten families who had lined up with the landlords, was allowed to work for wages in the village. Attached labourers were sent out. No harijan was allowed to enter the village market even to buy betel leaf. Workers were brought from neighbouring villages for carrying on farm work. The harijan sharecroppers who had raised paddy in plots ranging from 15 to 30 cents each were not permitted to go anywhere near the fields. Lachimakka who was tending the cattle of the village was stopped from doing so forthwith. Three out of the four dhobis were not permitted to work in the village. When the committee met the landlords they complained that the harijans were becoming 'well-to-do'—they were beginning to have lands and 'even tamarind trees'. The landlords were angry that the police force could arrest landlords. They complained that there was 'no police protection to ryots'. One complained that he had lost Rs 500 given as loan to one of the harijans. On enquiry it was found that it was the case of bonded labour. Another interesting thing which came out from the conversation was the landlords' feeling that every activity of a harijan which was likely to question landlord supremacy was seen as being the result of 'inspiration' by the 'radicals'. Also the welfare prgrammes of the RES were dubbed as 'radical activities'.

But the harijans showed a grim determination to face the socio-economic boycott with united action. Talking with them revealed the precarious nature of their existence. On the day of the attack most of them had gone without food for the whole day. On February 20 when the committee met some of them, hunger was writ large on their faces. Also there was no sign of any relief to these families from the government. The Moogavada episode exposes the chasm between the precept and practice of the government with regard to the weaker sections. Increasingly the sources of livelihood of the weaker sections is a much professed objective of the government, in the state as well as at the Centre. One of the measures accepted as a means to achieve the objective is the distribution of surplus land, public lands or income-yielding assets to weaker sections. But the Moogavada incident shows that appropriate machinery for impelmenting the measures has not been evolved. The revenue administration is grossly inadequate for handling the welfare schemes. Sometimes it may even be an obstacle. The government has failed to distribute even public assets like tamarind trees, let alone carry out other welfare measures. Secondly, protection of weaker sections from exploitation and atrocities continues to be confined to the level of rhetoric. The very fact that the landlords could take the law into their hands shows who actually rules the countryside. Once an asset is passed on to a beneficiary it is the obligation of the government to see that the beneficiary enjoys its fruits. Equality before law, without the will to enforce it, is a myth. Thirdly, the absence of adequate information about public lands and trees like tamarind on public lands shows the gross neglect of public property management. Proper accounting of these resources and access to the public to such accounts have great potential for improving the condition of living of the people. Finally, there appears to be an increasing tendency towards blaming everything on the so-called 'radicals'. When a government gives 'patta' to a weaker section household it is done with lot of fan-fare and publicity and everyone in the government claims credit for it. But no one in the government takes responsibility to see that the 'pattas' are in the actual possession of the allottees.

*Post-Script*: Despite the fact that the Tahsildar swore that he would get the harvest done in favour of the beneficiaries by February 21, no action was taken. Instead advocate Chari and two office-bearers of the RES were arrested on false charges and remanded to judicial custody from where they were released on February 23 on condition that they would not leave Madanapalle town. On the 22nd, a week after the incident, the Director of Scheduled Castes and Scheduled Tribes, Southern Region, visited the village. After that the Tahsildar proceeded to the village with a police party to help the pattadars. But because of the terror created by the landlords and the inaction of the authorities, only 36 families took courage to harvest the produce on roughly 36 trees. The rest of the harijans had given up.

### PREVENTIVE DETENTION

# Erosion of Constitutional Safeguards

**K G Kannabiran**

BY the National Security (Second Amendment) Act, 1984, the grounds of detention were made severable and each ground was made an order of detention by a legal fiction. Moving this Amendment Bill to the National Security Act, Narasimha Rao stated that the aim of the amendment was only to resolve the conflict between the multiplicity of judgments on the Act with some holding that invalidation of one ground was sufficient to make the detention order itself invalid and the other holding a contrary view. He also relied on a judgment of the Supreme Court delivered in 1983 wherein it was held that the invalidation of one out of several grounds need not make the detention order invalid. When the opposition made references to the use of MISA during the Emergency, Narasimha Rao said, "we are now talking of a different situation and a different concept and let us not go into the past". He even asserted that the Preventive Detention Law he was defending was not draconian and that it did not add one iota of power.

Every one of these assertions is a lie. Narasimha Rao could confidently assert his party's right to introduce the amendment because he had behind him the solid support of yes-men who are there not to deliberate but to support every governmental measure. The opposition in Parliament is too weak to even formulate a strategy to focus the attention of the public on the real issues involved and expose the democratic swindle. Organised and intelligent protest outside Parliament is practically non-existent.

The result was that Indira Gandhi's government was able to brazenly bring in a series of repressive laws which can be effectively used against political dissent without the necessity of invoking the provisions relating to the declaration of Emergency. By the first amendment the maximum period of detention was extended to two years. By the second amendment the government saw to it that none of the persons arrested are released by courts. The scope for judicial review which is already minimal has been reduced to nothing. The latest proposal of the Punjab government to do away with the advisory board procedure is the logical culmination of the previous amendments.

Article 22 of the Constitution is in two parts. Clauses 1 and 2 of the Article deal with arrests and production before the Magistrate within 24 hours. The arrested persons should be informed of the grounds for their arrest and they have also, while in custody, the right to consult the lawyer of their choice. The first two clauses are systematically violated by the law enforcing agency all over the country. Protest, if any, proceeds invariably from civil liberties organisations. We are at present not concerned with these clauses.

These two clauses are not applicable to any person who has been detained under any preventive detention law. Sub-clauses 4 to 7 deal with preventive detention laws. Recognising that preventive detention is a complete negation of all freedoms, more particularly freedom of movement and personal liberty, these clauses as they stand now impose on Parliament certain limitations in the matter of legislation on preventive detention. No law can provide for preventive detention for a period of more than two months without the intervention of the Advisory Board. The Advisory Board is to be constituted in accordance with the recommendations of the Chief Justice of the High Court. This is to ensure that the case of the detenu should be considered by an independent body. By clause 7, Parliament alone is given the power to prescribe the maximum period of detention. By the first amendment, taking advantage of the Punjab situation, the maximum period has been extended from one year to two years.

### GROUNDS OF DETENTION

Apart from these, the safeguards provided by clause 5 are very important, for this clause gives the person detained a right to approach the court and contest that his detention is invalid. As preventive detention is a pre-emptive step to forestall a particular type of activity defined in the Act, the decision-making process will have to be a subjective assessment of the detaining authority. This subjective exercise of power is by its very nature arbitrary. The safeguards provided are to reduce the arbitrariness. The power to act and its subsequent validity are dependent on scrupulous compliance with the safeguards provided. The detaining authority should serve the grounds of detention on the person detained. These grounds do not mean mere factual inferences. They mean and include factual material which lead to the factual inferences. They must be self-sufficient and self-explanatory. If any documents and other material are referred to in the grounds, copies of such documents and material should be supplied to the detenu along with the grounds. The grounds and the material relied on in the grounds should be made available in the language known to the detenu. As the power to detain is entrusted to the subjective satisfaction of the detaining authority the obligation implied is that he should while considering the material for arrest take into account the pertinent and the proximate eschewing the irrelevant and the remote with reference to every one of the grounds.

The grounds should not be vague. These safeguards are not provided in the Act. They are read into and are part of clause 5 of Article 22. These flow out of the right of the detenu to obtain information regarding the grounds of his arrrest and the consequential right to make a representation questioning his detention. This right is independent of the duration of the period of detention and the provisions regarding the Advisory Board. Infraction of the safeguards read into Article 22(5) will make the detention invalid and the detenu has the right to approach the court demanding his release forthwith. The Supreme Court always regarded preventive detention as a serious invasion of personal liberty and violation of the meagre safeguards provided by the Constitution against improper exercise of power was annulled without any hesitation. The principle evolved was nothing new and it was part of Anglo-Saxon jurisprudence. The innovation was to read them into Article 22(5) with a view to preventing the State from bringing forth legislation which may shut out the courts from reviewing orders of detention.

### ATTEMPTS TO PREVENT SCRUTINY

The Indian state has been making attempts to prevent scrutiny of detention orders by courts from the very inception. The Preventive Detention Act 1950 contained provisions which prohibited disclosure of the grounds of detention or any representation made against such detention before any court. The injunction was directed against the court from receiving such information from the detenu. Nor can it call for the production of records containing such information from any public officer, including the proceedings of the Advisory Board. Any such disclosure was made a punishable offence. This provision was struck down by the Supreme Court unanimously in A K Gopalan's case.

Atmaram Shridhar Vaidya, an active trade unionist of AITUC was arrested on April 21, 1950. On April 29, 1950 he was served with a detention order. Four months after his detention order and one month after he moved the court for his release, the government served on him supplemental grounds. In this case, the Supreme Court held by a majority that the person detained is entitled, in addition to having the detention order communicated to him, to a further right to have particulars 'as full and adequate as the circumstances permit' furnished to him so as to enable him to effectively make a representation against the order of detention. It was also held that the second communication, if there be any, after the initial order of detention and service of grounds is also justiciable. These rights were declared to be part of Article 22(5).

Ramkishan Bharadhwaj of the Hindu Mahasabha questioned his detention order in 1953. One of the grounds was vague and it was contended that even if one ground was vague it would infringe the safeguards guaranteed by Article 22(5). The argument of the State was that if a ground is vague it was always open to the person detained to ask for particulars before making his representation.

> The question however is not whether the petitioner will in fact be prejudicially affected in the matter of securing his release by his representation, but whether his constitutional safeguard has been infringed. Preventive detention is a serious invasion of personal liberty and such meagre safeguards as the Constitution has provided against the improper exercise of the power must be jealously watched and enforced by the court. In this case the petitioner has the right under Art 22(5) as interpreted by this court by a majority to be furnished with particulars of his detention sufficient to enable him to make representation which on being considered may give relief to him. We are of the opinion that this constitutional requirement must be satisfied with respect to each of the grounds communicated to the persons detained subject of course to a claim of privilege under clause (6) of Article 22.

After this decision the court has not resiled from this position.

### NEW STRATEGY

The government evolved a new strategy. It realised that a single Preventive Detention Act for all classes and categories of people was the mistake Nehru had committed. Why should one lump communists, socialists, members of communal organisations, lumpens, black-marketeers, smugglers, etc, together? Separate laws for each category or class would divide the protest and that way there would be less scope for challenge in courts. A draconian piece of legislation against lumpen elements or a smuggler is not likely to evoke protest. We may not even challenge such a measure because we tend to take a moralistic stand and justify the draconian measure. Courts may also take a moralistic view and uphold such measures. If it stands the test of public opinion, and if courts uphold such a measure a principle is laid down. It is then time to extend the principle to other sensitive spheres of activity which need to be suppressed, The arbitrary provision gets legitimised and dons the mantle of legality and survives from then on as an abstract juristic principle.

The Conservation of Foreign Exchange and Prevention of Smuggling Activities Act was passed in 1974. Immediately after Emergency was proclaimed Section 5-A was introduced. The provision in terms seeks to nullify the safeguards contained in Article 22(5) as laid down by the Supreme Court. If a person has been detained in pursuance to an order of detention on two or more grounds such order shall be deemed to have been made on each of such grounds and hence such detention shall not be invalid merely because one or some grounds is or are vague, irrelevant, remote or non-existent.

The validity of this provision has never been challenged. The provision seeks to sustain the validity of the detention order on a legislative fiction. How can a fiction take the place of 'satisfaction' of the detaining authority at the time of passing an order of detention? The provision dispenses with the necessity of application of mind by the detaining authority as also his satisfaction that the material placed before him relates to the classes and categories of activities which are sought to be prevented by the arrest. How can the detaining authority be presumed to pass several orders of detention when in fact he has passed only one? Legal sophistry in and by courts can be totally divorced from reality as was ably demonstrated by the majority in A D M Jabalpur's case. Add to this the tendency to write dissertations instead of judgments and to make general observations which are not relevant for the decision of the case. Such observations are taken note of by the executive and offered as explanation for introducing unpopular and undemocratic measures, as was done by Narasimha Rao in Parliament.

The classic instance is that of Justice Varadarajan delivering judgment for himself and on behalf of Justice Chinnappa Reddy. While quashing the order of detention under the National Security Act, in a case coming from Madhya Pradesh it was observed:

> Now there is no provision in the National Security Act 1980 similar to Sec 5-A of the Conservation of Foreign Exchange and Prevention of Smuggling Activities Act, 1974, which says that where a person has been detained in pursuance of an order of detention under sub-section(1) of Section 3 which has been made on two or more grounds, such order of detention shall be deemed to have been made separately on each of such grounds and accordingly, (a) such order shall not be deemed to be invalid or inoperative merely because one or some of the grounds is or are vague, non-existent, non-relevant, not connected or not proximately conneeted with such persons or invalid for any other reason and it is not therefore possible to hold that the government or officer making such order would have been satisfied as provided in sub-section(1) of Section 3 with reference to the remaining ground or grounds and made the order of detention; and (b) the government or officer making the order of detention shall be deemed to have made the order of detention under the said sub-section(1) are being satisfied as provided in that sub-section with reference to the remaining ground or grounds (AIR 1984 SC 211).

In short the learned judge said in so many words that had there been a similar provision in the National Security Act, 1980, we would have upheld the detention order. A piece of gratuitous advice.

The learned judge when he made this statement did not verify the long catena of cases wherein the Supreme Court has read into Article 22(5) safeguards which cannot be defeated by such legislative devices as are contained in COFEPOSA or the Second Amendment to the NSA.

Way back in 1970 to put down the Naxalite movement, the Andhra Pradesh legislature passed the AP Preventive Detention Act. It contained a provision similar to the one found in the COFEPOSA and the Second Amendment to the National Security Act. It read as follows:

> Sec 6(a): No detention order shall be invalid or inoperative merely by reason that one or more of the grounds on which the order is made, is or are vague, or irrelevant, when the other ground or grounds does not or do not suffer from any such infirmity.

Revolutionary writers Charabanda Raju, Nikhileswar and Jwalamukhi were arrested under this Act for their writings and speeches. The validity of this provision was challenged in the High Court. Justice Chinnappa Reddy and Justice A D V Reddy struck down the provision as violative of Article 22(5) wherein they traced the entire history of the safeguards read into Article 22(5) (ILR 1972 AP 1025).

This was the first of the series of the measures introduced by Indira Gandhi's government taking advantage of the Punjab situation.

### TELUGU DESAM FOLLOWS SUIT

The Telugu Desam government, not to be left behind, has passed a Preventive Detention Act covering communal offenders. 'Communal offenders' is defined by reference to the relevant provisions of the Indian Penal Code. Indictable offences have been made the basis of preventive detention orders and courts have been examining them in the context of public order. Classification of offences and offenders in a penal code is perhaps the accepted method of management of crimes by the state. But classification of suspects for purposes of preventive detention and passing of different sets of laws covering various categories of suspects is to replace a just procedure by a wholly arbitrary one—to give up indictment followed by trial and to introduce subjective satisfaction as a measure to punish pre-emptively suspects without proof and with flimsy procedural safeguards.

The process of classification of suspects may not stop here. Already there are four enactments covering the entire spectrum of political dissidents and economic offenders. Telugu Desam has introduced a fresh Bill to check bootlegging, land-grabbing, etc. The pattern of legislation and the fate of accusatory procedure are visible for anyone to see. With the Punjab issue converted into a question of the integrity of the nation, we are trapped in the threat-to-national-security syndrome. Security, as the good of the nation, is incompatible with the permanent insecurity of the people. The very idea of a threat to security invites repressive measures and with these follow arbitrary arrests, illegal confinements and custodial violence. State does not any longer represent the value system it is intended to promote and sustain, but works towards the sytematic destruction of the value system for which so many people laid down their lives.

Sometimes it becomes necessary to dig into the past to understand the extent of distortions that have been introduced into the legal system almost imperceptibly and always in times of crisis. Many members of the Constituent Assembly felt that Article 21 as it was approved "gave to Parliament a *carte blanche* to provide for the arrest of any person under any circumstances it deemed fit". Therefore the present Article 22 was introduced to curtail the power of the executive to make arrests. When this Article was being debated, Mahavir Tyagi alone was able to foresee the distortion that in fact has taken place when he said that "the adoption of Article 15-A [present 22] would change the character of fundamental rights into a penal code worse than the Defence of India Rules of the old government. The business of the Constitution makers was to guarantee the rights of people and not to make laws to deprive them of their rights."

## Polar Industries

POLAR INDUSTRIES, a dividend paying company engaged in the manufacture of electric fans, is coming to the market with a public issue of 8.10 lakh equity shares of Rs 10 each to raise a part of the finance required for expansion of installed capacity from 1.50 lakh fans to 3.60 lakh fans per annum. The issue will open on May 7. The project is expected to be commissioned by August next. The company's factory is situated at New Okhla Industrial Development Area (NOIDA) in Ghaziabad district of UP. The state government has granted the company exemption from sales tax for six years, which is of great advantage to the company. It is promoted by Sajjan Kumar Aggarwal who has been associated with the electric fan industry for the last 20 years. With a well-established product brand name in the market, the company envisages no difficulty in marketing its expanded production. The demand for electric fan is expected to rise steadily. The company started manufacturing activities in December 1982 and turned out good working results from the very first year of operation. Sales turnover increased from Rs 104 lakh in 1982-83 to Rs 210 lakh in 1983-84 and profit before tax doubled over the same period. The company declared a maiden dividend of 12 per cent for th eyear ended September 30, 1984, the first full year of operations.

**BANGLADESH**

# Betrayal of Civilian Politics

### T V Sathyamurthy

WITH the referendum of last March and the announcement of the elections in May 1985 of 460 *upazilla* councils[1] as a prelude to the process of 'civilianisation' of military rule, the stage has been set for yet another repetition of what is by now a familiar pattern of events in Bangladeshi politics. Since the original coup of 1975 which brought Bangladesh's infant parliamentary democracy to an abrupt end, there has been no real return to civilian politics as they are normally understood. The course of Bangladesh politics, over the last decade, seems to have jelled in the form of a cycle in which a coup is followed by a series of invariably violent readjustments within the armed forces involving different groups contending for power, the emergence of a single leader whose capture of the executive power of the state leads to the esablishment of a base for the regime in the form of a new political party, the eventual alienation of the armed forces from the Head of State thus 'civilianised' which paves the way for another major coup aimed at a reassertion of the dominance of the military.

Mujib inherited an extremely fragile state structure from the Pakistani colonial power after a truncated liberation movement which was quickly brought to an end by the intervention of the Indian armed forces. Right from the beginning, Bangladesh's condition was marked by the almost parasitic dependence of its economy on foreign (and especially western) countries, and the sheer inability of the party in control of state power to carry out its main tasks. Those consisted of finding ways and means of generating the surplus needed to keep Bangladesh's non-producing and comprador petit bourgeois ruling class (whose interests the party in power represented) satisfied, while simultaneously creating conditions in the rural economy under which the vast majority of the population engaged in agriculture would be able to survive their hyper-exploitation at the hands of rural power-holders on whom Awami League (AL) relied for support.

The monumental corruption of AL, the fecklessness of the new bureaucracy at all levels, the alienation between a pro-Pakistan army and a pro-India ruling party which was exacerbated by the persistence of para-military elements in the society at large, the failure of the government to utilise the massive injections of foreign aid that it received for the purpose of laying the foundation of a producing (let alone a modern) economy, and, above all, its ineptitude in the face of drought and famine, were some of the main factors underlying the assassination of Mujib and the overthrow of the AL government.

However, for all its deficiencies, AL does have a long history of populist political protest stretching back to the early 50s and marked by militant struggle against the Pakistani military rulers from time to time. After the 1975 coup, however, it stood exposed as a party which had totally failed to consolidate its hold on the new state. Factionalism within the party rapidly undermined even the semblance of cohesion that it had been able to maintain during the initial years of independence. Awami League, out of power, soon proved to be incapable of recovering the credibility that it had lost when it was in power. Nevertheless, its tattered remnants, occasional gasps of revival, and the political skills of at least some of its leaders to forge coalitional links between their splintered party and other political parties serve as constant reminders of the failure of civilian politics in Bangladesh and the uphill struggle that any credible civilian alternative force will have to face if it were to wrest political power from the military.

## ZIA'S APPROACH TO POLITICS

It is interesting that, after consolidating himself in power, Zia turned his attention to the task of keeping the loyalty of the armed forces intact while building a civilian political base for himself at the same time. As a populist, he even surpassed his predecessor in his ability to reach out to the rural masses of Bangladesh. But, under the existing conditions of Bangladesh, popularity among the masses was going to be of little relevance to survival in power unless fortified by solid support from the class of rural power-holders and urban exploiters whose easy access to the corrupt bureaucracy ensured their economic dominance. However, this class has always been in an acute state of crisis and fragmentation which tends to become aggravated whenever a new regime, in search of legitimation, attempts to mobilise it.

For a time, Zia seemed to be successful in his efforts to retain the support and loyalty of the armed forces. He achieved this end mainly by engineering a series of assassinations and courts-martial designed to get rid of potential rivals including a number of military officers who had been present in the country at the time of the liberation struggle during 1970-71.

In the political sphere, however, a daunting spectacle presented itself in the shape of a massive splintering and emasculation of all existing parties on the right, the centre, and the left. Even so, AL seemed to be the only party which had any life left in it, and Zia's original strategy of founding a political base upon which to legitimise and 'civilianise' his rule consisted of an attempt to step into Mujib's shoes as the leader of AL. In this, he had grossly underestimated the extent of the animus against the military within the ruling circles of AL and the hostility that even the thought of such a development was bound to evoke in the minds of leaders and followers alike in the party.

Zia was thus left with the only alternative of creating a new political party through which money, jobs, as well as other forms of patronage and opportunities for the exploitation of primary producers could be provided to supporters who, in turn, would help impart civilian legitimacy by mobilising popular following for the regime. The basic aim was to retain control of the substance of state power in the hands of the military, while co-opting civilian political forces as a junior partner with a view to giving the regime a civic gloss.

Zia's political philosophy has been described to me by a noted Bangladeshi intellectual as basically Hobbesian in character. It was derived from the assumption that there is no one who could not be bought and it is the duty of a political leader in need of support to buy loyalty by paying the appropriate price. Zia's approach to politics thus consisted of systematically corrupting key individuals in society (at all levels) in order to gain their support.

The Bangladesh National Party (BNP) emerged as the political offshoot of Zia's efforts to create a base for himself. Unlike AL which had a mass populist orientation, deeply intermeshed with its essentially comprador petit bourgeois character, BNP was a party of a section of the same petit bourgeoisie of Bangladesh with a much more restricted popular base. Zia's own dynamism and popularity of course had some effect in recruiting grassroots support for the new party, but any such support did not necessarily rub off on BNP as a party.

Zia's quest for civilian legitimation inevitably distanced him from the armed

# With the "single window" clearance, you can set up your export unit within 45 days.

NEPZ-0081

If you thought that setting up your 100% export oriented unit was going to be a long, complicated affair, take a look at the Noida Export Processing Zone.

Within just 45 days of filing your application, we'll obtain all clearances for you—licences, approvals on foreign collaboration, MRTP, etc.

We will get your unit off to a quick, flying start. And ensure that it continues to function that way.

## An exporter's paradise.

The NEPZ is a veritable exporter's paradise, offering unbeatable incentives. These include exemption from all taxes. A complete, ready-to-use infrastructure. An exclusive on-site Customs clearance office. OGL import benefits. And liberal foreign exchange release.

In short, NEPZ offers the greatest opportunity for exports of your product. Be it computer software, electronic items, leather goods, processed foods, knitwear ... the list is endless.

## Lower manufacturing costs. To help you offer competitive world prices.

Since you won't pay any taxes or levies, your manufacturing costs, and the prices you offer, will be drastically lower.

And you can freely import raw materials to match the world's best products in quality.

## You'll practically be working from New Delhi.

The benefits of being close to Delhi are enormous.

You'll be able to reach any part of the world in minutes—through the Capital's huge global telecommunication network.

For urgent despatch of your cargo, there's Palam Airport—barely 30 km away. Sealed vans will transport Customs cleared cargo from the Zone to the Airport. And to the Inland Container Depot at Pragati Maidan for carriage by rail to the seaports.

You'll also have immediate access to everything else New Delhi offers. The commercial, financial and industrial infrastructure. The network of Governmental offices. The experienced urban workforce. And the Capital's round-the-clock transport links with the rest of India.

### The Infrastructure

- Accessible location : adjacent to Noida Phase 2, distt. Ghaziabad, at the Delhi—U.P. border. Just 25 km from Connaught Place, and 15 km from Nehru Place.
- Area : 33 hectares (82 acres). Extra 200 hectares (500 acres) earmarked for expansion.
- 45 developed plots of 1500-4000 sq.m. available on 30-year lease. Built-up space from 500 to 850 sq.m. in Standard Design Factory format, on 5-year renewable lease.
- Priority telephone and telex connections. Containerized digital electronic telephone exchange hooked to Delhi Telephones by a microwave link.
- Guaranteed uninterrupted power supply.
- Large warehousing, clearing and forwarding facility.
- Containerized road movement of goods.
- NEPZ's own fully staffed Customs clearance office for spot clearance of incoming/outgoing cargo.
- Post offices, including an exclusive International P.O.
- Banks.
- Roads, drainage, street lighting.
- Police station, fire brigade.
- Housing, educational, medical and recreational facilities in nearby Noida Township.
- Industrial canteen
- Executive restaurant

### The Incentives

**By the Government of India :**

- A tax holiday for the initial 5 years.
- Exemption from basic, additional and countervailing Customs Duty.
- Exemption from import licence under OGL, for capital goods and production materials.
- Exemption from Central Excise Duty and other levies on goods made within NEPZ.
- Exemption from Export Control Order restrictions.
- Reimbursement of Central Sales Tax paid by units on purchases outside U.P.
- Special relaxation in local levies like Octroi, Sales Tax, etc.
- No restriction on foreign shareholding and repatriation of profits.
- Priority release of cement and steel.
- Permission to sell 25% of production in the domestic tariff area to valid import licence holders.
- Liberal foreign exchange release, including blanket permit for overseas visits.
- Packing credit facility for 180 days.

**By the Government of U.P.**

- Easy availability of term loans, equity participation, underwriting of shares, bridging loans and seed capital through state corporations of the Govt. of U.P.
- Concessional power tariff, and exemption from power cuts.
- Capital subsidy to small units—including interest subsidy and margin money loans.
- Exemption from Octroi duty for 5 years.
- Subsidy for purchase of generating sets.

### The Administrative Support

- All procedures simplified.
- High level, quick decision-making infrastructure. (NEPZ Authority, the single decision-making body, headed by the Minister of State for Commerce. The Board of Approvals, headed by the Addl. Secretary, Ministry of Commerce.)
- Entrepreneurs serviced by the Zone Administration, headed by the Development Commissioner.
- Exclusive NEPZ Service Centre helps units start production in the shortest possible time, with all follow-up assistance for smooth operation.

***If you have a 100% export-oriented project, with a minimum value addition of 30%, NEPZ is just the place for you. Pollution-free projects with high tech/foreign collaboration preferred. For a detailed brochure and application form, write to :***

# Move into NEPZ. Move out to the world.

forces which were averse to sharing a sizeable proportion of the resources, to which the state had access, with leading segments of the newly established ruling party. Underlying the restiveness of the military in the face of this new development were two other major factors—*viz*, the resentment of the military against the bureaucracy raking off more and more of the surplus, aid money, and other resources under the new dispensation; and the political consequences of the interposition of a civilian structure of authority in the hinterland where the military had become accustomed to regarding itself as the direct extension of state power.

Zia's brand of corrupting the system in order to win legitimacy floundered on the shoals of military mistrust of his political motivation. The inevitable coup against him was followed by a brief experimentation with propping up BNP as a ruling party and at least formally a major partner in a civil-military condominium exercised through a diluted form of franchise.

This was bound to fail given the fact that BNP, a fragile offspring of artificial political insemination, was even less suited to wielding control of state power than AL with its strong roots in Bangladesh's chequered history. The interim between the overthrow of Zia's partially 'civilianised' regime and the next major coup against the shortlived BNP government under Sattar, was thus characterised by endemic confusion in civilian as well as military circles as to the path that Bangladesh politics should follow in order to break out of the vicious circle in which it had become caught during the first decade of its history.

It is an interesting commentary on the role of AL that, even in this confused condition of the country, it was in no position to unite its fragments and give leadership to the country. If it had, no doubt the military too would have united its ranks and resisted AL's march to power. But, the antipathy between AL and the military need not necessarily have persisted as a stumbling block to a fresh political start had AL actually demonstrated its ability to open to a new chapter in the history of the country.

### ECONOMIC STAGNATION

Ershad, like Zia before him, emerged as a figure over whom different factions within the military could agree as the Chief Martial Law Administrator. He inherited an economy which had hit rock bottom even by Third World standards. Despite foreign aid to the tune of over Taka 1,000 crore received during the first half of Zia's rule, Bangladesh had hardly started to industrialise, because Bangladeshi entrepreneurs would not invest in industry whilst the state simply emptied money earmarked for industrialisation into the pockets of Bangladesh's rapacious comprador petit bourgeois class. The agricultural economy, at the best of times dependent upon nature's whims, had not yet benefited to any significant degree from the policies of the government. The economic stasis into which Bangladesh had sunk emphasised the political bankruptcy which lay at its root.

Unlike Zia, Ershad is a recessive figure who has so far managed to remain more or less secure as the military's candidate for the office of Head of State. But, as in the case of Zia, his way to gaining all round acceptance within the military has also been paved with the blood of rivals and opponents alike. Although he has trained himself to make frequent appearances before the public, his preference for the security of a Commander-in-Chief's secluded residence to a life style that would bring him into contact with the masses[2] has been so marked that in his attempts to gain 'civilian' legitimacy he has had to face even greater obstacles than Zia.

Ershad's initial attempt to bring the civilian polity into the picture took the form of overtures to BNP with a view to becoming its leader. This, in view of the fierce loyalty of dominant segments of the party to Zia and the political ambitions of Khalida Begum, Zia's widow, who was held in especial esteem in BNP, proved to be a non-starter. At the same time, rapid economic deterioration was accompanied by many a political voice raised against the military regime. Even although no united political force was yet in the offing, the conditions for the emergence of coalitions based on a lowest common denominator of opposition to military rule were present. Under these circumstances, there was an even more urgent need for Ershad to seek political legitimacy and 'civilianise' his rule than had been the case for Zia.

Thus, by the beginning of 1983, political parties were ready to activate their demands for an end to military rule and the establishment of a popular government based on a general election. The students once again came to the fore by organising agitations in favour of such a change of regime. AL, under the leadership of Shaikh Haseena (Mujib's daughter) and BNP with Begum Khalida at its head, as well as other political parties entered the fray. The revulsion of the urban middle classes and in particular the intelligentsia against military rule showed itself in an unambiguous manner.

And yet, the student leaders as well as the leaders of the various political parties were far behind their followers when it came to a question of actually mobilising the masses to confront the military regime, expose its hollowness, and throw it out of power. This aspect of Bangladesh politics

JUST RELEASED

**AFRICA: AN ECONOMIC AND POLITICAL STUDY**

**By HARJINDER SINGH (University of Delhi)**
**1985/Pp 250/Price Deluxe Edition Rs. 150/-**

The International Development Strategy for the Third United Nations Development Decade and the Lagos Plan of Action proposed the target of about 6 per cent average annual GDP growth for African countries for the period 1980-1990. The annual GDP growth would imply doubling of real per capita GDP in 20 years. The two important sectors namely agriculture and industry are required to grow annually at about 4 per cent and 9 per cent respectively during the same period. It has also been recognised that Africa has considerable economic potential which needs fuller development.

This book highlights the severity of the problems facing African countries in their efforts to raising the per capita GDP. It also analyses factors which retard the efficient use of human and capital, domestic and foreign resources for improving their economic conditions.

is crucial to an understanding of the more or less chronic impasse in which Bangladesh polity seems to be caught.

### FAILURE OF POLITICAL PARTIES

Ershad was sufficiently frightened by these manifestations of restlessness to believe that the legitimacy of his regime would have to be shored up by means of some sort of a political alternative to BNP upon whose support he could base his claim to power. The Union Parishad elections of (August) 1983, represented the first step in his attempt to build a civilian grid of political influence capable of reaching down to the grassroots. But he knew that the coming into being of these Parishads would not be a sufficient basis for legitimising or 'civilianising' the military regime. By the end of 1983, the beatific smile that he wore on his face in his television appearances had already begun to yield place to a countenance that betrayed a vague sense of apprehensiveness.

Throughout 1984, a struggle was mounted against the military regime in which AL, at the head of a coalition of 15 parties (latterly including, paradoxically, even the Jamaat-e-Islam) and BNP at the head of a seven-party coalition openly challenged Ershad's legitimacy and advocated the rejection of the military regime. But, characteristically, the political leaders' disturst of the masses was reflected in their simultaneous decision to engage in negotiations with Ershad in which the two sides sought to bargain with one another on five main points.

At the same time, having put themselves forward as forces seeking a total and unequivocal rejection of military rule and its replacement by a civilian government elected by universal adult franchise, neither coalition saw fit to outline concrete policies to which they would be prepared to commit themselves should they be returned to power in the event of an election. The rallies addressed by the two leaders invariably degenerated into Shaikh Haseena voicing a desire to avenge the death of her father or Begum Khalida demanding that Zia's assassins should be made to pay for their 'crime'.

Thus, an intelligent and discriminating populace was exposed to civilian politics of a brand which failed to arouse its enthusiasm. In fact, such was the cynicism of civilian leaderships belonging to all types of political parties and at all levels that, on one occasion, when an entire student body had assembled to start a march to the Chief Martial Law Administrator's office protesting against the military regime and demanding its resignation in order to pave the way for elections, the leaders who had issued the call in the first place were nowhere to be found. The students were so enraged that instead of getting on with the march by themselves they went out on a search for their leaders whom they beat up in disgust.

The strategy of negotiating with the military government, whilst paying lip service to popular mobilisation, simply could not work. It became increasingly clear to Ershad that the two coalitions were no more than paper tigers. He therefore waited for an opportunity to call their bluff. When the coalitions attempted to block Ershad's move to hold a general election on April 6 of this year, on the ground that no election held under the aegis of the Chief Martial Law Administrator could be trusted to yield a clean result, he was faced with a choice between temporising further (in which case he would almost certainly have alienated powerful groups in the armed forces which were already growing impatient with his 'soft' line) or going ahead with an alternative plan of 'civilianising' his regime and giving it legitimacy.

The vehicle for the alternative plan in the form of a new party launched by Ershad about two years ago was still very weak. Jana Dal (JD) is an even more highly synthesised political concoction than BNP. Its social base is identical with that of BNP. And, as the latter is well established, the appeal of JD is bound to be restricted even although in rural areas state patronage through the Union Parishads may, over the past year or so, have given it a footing in the countryside. It was the feebleness of JD as a political force that lay at the root of Ershad's hesitation until the last moment, to take on the two seemingly formidable coalitions.

Early during 1985, the *immobilisme* into which Bangladesh politics had sunk had to be broken. Taking a leaf from Zia's experience in 1978 and also Zia ul Huq's defiance, towards the end of 1984, of Pakistan's political parties, Ershad decided to hold a referendum with the aim of proving that the Martial Law Administration in general and the rule of the Chief Martial Law Administrator in particular had popular approval and was therefore legitimate. It is a well known fact that in the referendum a vast majority of the people voted with their feet, the actual results were cooked, and a fake 94.7 per cent victory announced even before polling ended!

The really important point about Ershad's referendum, it must be remembered, is not its patently counterfeit character, but, rather, the political bankruptcy and shallowness of the two coalitions which challenged the legitimacy of his rule and to which the electorate has shown its scarcely concealed contempt. Thus the issue which the electorate saw in the referendum was not the one relating to the legitimacy or otherwise of the martial law administration. Rather, the referendum provided an occasion for recording the disillusionment of the mass of the Bangladeshi people with military rule while, at the same time, permitting them to demonstrate their lack of confidence in the civilian political alternatives available by ignoring them altogether.

A montonous repitition of well-worn alternations of coups with chaotic and bloody interludes in between seems to be what is still in store for the unfortunate people of Bangladesh. In the meantime, the dawn of an era of civilian politics based on free elections has been pushed further forward by the spinelessness of the leaders of all the political parties of Bangladesh. No electorate, least of all the Bangladeshi electorate, deserves such impotent political leadership.

## Notes

1 This represents the second stage in local government reform by which two tiers of political administration controlled by locally elected leaders are to be brought into existence. The first consists of Union Parishads which are already in existence. Each Union consists of an average of ten villages; *upazillas* will be delimited by bringing together ten to twelve Unions to form one *upazilla*. In a recent official communique, Ershad has announced that *upazilla* council chairmen will enjoy rank, perquisites, and privileges equivalent to that of a Major in the army or a Deputy Secretary to the government, whilst the Chief Executive or Administrative Officer will enjoy a substantial salary by local standards.

2 During a recent visit to Dhaka, I happened to pass by the house in which the Bangabandhu lived when he was in power. It is an ordinary unpretentious two storeyed dwelling of moderate size which is not even set far enough inside the compound to ensure a modicum of security. For all this faults, Mujib was a truly fearless leader who lived in the midst of his people even though this made him an easy target of assassins. Zia became more and more accessible to the people as he felt increasingly secure in power, but he lived more or less well insulated from the teeming masses. But, Ershad lives under such heavy security that his residence cannot even be seen from any of the roads running in the Cantonment area.

# The Steel Story

### Bagaram Tulpule

**Engineering Change: India's Iron and Steel** by K Krishna Moorthy, Technology Books, Madras; pp 434, Rs 250.

HISTORY of the Indian iron and steel industry since independence has been a chequered one. The successful completion and commissioning of three one million tonne integrated steel plants early in the sixties and fruitful collaboration and transfer of technology from three distinct sources was no mean achievement. It held out promise of brighter things to come. Indeed, even before the original capacities of the three plants had operationally stabilised, their expansion was taken in hand. An additional new plant at Bokaro was conceived. With TISCO and IISCO also going in for expansion, a yearly ingot output of around 10 million tonnes from the integrated steel plants did not seem too distant.

That the promise was not realised is old story. Little seems to have gone right with the industry since that early success. A wide diversity of views have been expressed by lay people as well as by experts as to why this has been so. Faulty planning, political pressures on decision-making at the highest level, bureaucratic bungling, lack of continuity in policies and leadership, inept management, irresponsibly militant trade unions and various other things have been held responsible for the stagnation and stultification of the industry. The problem, however, is too big and complex to lend itself to a ready, simple answer. Indeed, adequate information about how policies came to be formulated and decisions and actions actually came to be taken, may itself not be readily available to one who may want to understand better why the industry could not fulfil its early promise.

Krishna Moorthy's book throws a great deal of light on this murky field and should be a valuable aid to both the lay reader and to the serious student. His knowledge of matters relating to the steel industry is both extensive and deep, garnered as it is over a period of three decades. He seems to have had access to much relevant material and also to most of the persons who played key roles at the level of policy as well as execution, over this long period. Being a journalist by profession, he brings to this wide knowledge, a picturesque, entertaining style of writing that holds the reader's interest. One cannot, however, help feeling that the material could have been organised better, some repetitions avoided and the first person singular, a little less prominent. These too, perhaps, are features of a journalistic way of writing!

Krishna Moorthy traces in his book how the first three plants were conceived, what obstacles had to be overcome, how the assistance of the three collaborating countries was enlisted, the contributions made by the concerned political personalities and civil servants, the role assigned to indigenous technical talent available as consultants and managers. He also points to the probable causes why the actual performance of these plants over the years has been so dissimilar.

But that is a fairly straightforward story. The meat of the matter is where Krishna Moorthy narrates the twists and turns before the foreign collaboration for the Bokaro plant and, far worse, for the Vishakhapatnam plant were to be decided upon. Both these episodes are really very educative case studies of how a relatively straightforward techno-economic issue becomes a very complicated political one and how in the process time is wasted, costs escalate, indigenous talent and expertise languish and national interest suffers.

Krishna Moorthy has strong likes and dislikes of persons involved in the steel story and the roles played by them. The present reviewer rejoices that he is not among those the author strongly dislikes, judging by the comments in the book! His great admiration for the early participants—Nehru, T T Krishnamachari, Bhoothalingam, Khera, C Subramaniam (who has contributed a brief but pointed forward to the book) *et al*—is in striking contrast to his assessment of those who came to occupy key positions later on as ministers or civil servants or technocrats. About Hiten Bhaya, presently member of the Planning Commission, he is not exactly complimentary; about former SAIL Chairman Wadud Khan he is positively adverse. But his sharpest attack is reserved for Kumarmangalam whom he considers to be an egotist and whose decision to bring under a holding company all the public sector steel plants, coking coal, raw materials and some other related organisations, he considers to be a blunder. Many inside and outside the steel industry will agree with his view about the holding company. But many who knew Kumarmangalam will disagree profoundly with Krishna Moorthy's view of him as a man and a minister.

On at least one fact, the author is less than fair to Kumarmangalam. His statement that "Kumarmangalam did not have the courtesy of informing senior HSL and Bokaro managers in advance of his final choice of Mr Wadud Khan as SAIL chief" (p 277) is simply not true. The present reviewer who was in HSL at the time, can assert from personal knowledge that most of the senior HSL and Bokaro managers were given that information by Kumarmangalam himself.

The way Indian technologists were trained on the shop floor in the Soviet Union comes in for much praise, deserved no doubt, from the author. Unlike many others, however, he does not see any special excellence in the Soviet technology in the Bhilai plant. The superior performance of that plant he attributes to the large number of Soviet technologist who have been there all along. That, even if true upto a point, is perhaps not the whole story and, besides, is not very flattering to Indian technologists and managers.

The field covered by the book is very wide indeed. It deals with the private sector plant of TISCO besides the public sector plants, indigenous consultancy and R and D work in the industry, quality of raw materials, machine building capacity and organisations for building steel plants, profitability, or rather the lack of it, of the plants and what he considers to be the causes for this, new technologies for steel making that are either in the laboratory or pilot plant stage and many other facades. He also deals at some length with the internal problems of Durgapur, the sick child of the industry. His treatment of various aspects of the industry is mainly narrative/descriptive. Although he does not hesitate to make pointed comments when he feels them in order, he has desisted, wisely no doubt, from offering any comprehensive diagnosis or remedies for all the ills of the industry.

When such a wide field is sought to be covered, and that in considerable detail, some factual errors are bound to creep in. For instance, the author says at p 215 about Sanjeeva Reddy that he "... is reputed to have influenced the Janata government in choosing Vishakhapatnam when he was President". In fact, that venue for a steel plant had been decided upon long before Janata came to power and a chief executive and considerable staff had already been deployed there by 1973. Preparatory steps for the construction of the plant had already been taken. Some political manoeuvring might have been attempted in later years, but it was already too late to change the venue when Janata came to power. Biju Patnaik's announcement of October 1979 had to be more of a formality, apart from the fact that by that time the Janata government at the Centre had already fallen and the curious interregnum of Charan Singh was under way.

Another example. At page 360 Krishna Moorthy tells us that "from the time of lighting of a blast furnace to the first tap it may take about 24 hours". Actually that period is about three months! Wisely, he does not dwell too long upon such topics of technology.

To sum up, a reader interested in knowing not only the history of the Indian steel industry but also its past and present problems, strengths and weaknesses, is unlikely to find so much factual information and trenchant comment so readably presented in a single source as in Krishna Moorthy's book.

# Tragedy of Kosi

### S Hashim Ali

**Some Aspects of Irrigation Administration: A Case Study of Kosi Project** by Niranjan Pant; Naya Prokash, Calcutta; pp ix + 128, Rs 45.

IT is now increasingly realised that better irrigation administration is essential for improving the performance of irrigation projects which are constructed with huge investments. The present study provides further evidence to the growing feeling that irrigation utilisation is generally much below the planned level. In spite of its many natural resources, Bihar is the poorest state in the country. This study by Niranjan Pant of irrigation administration in Kosi Project brings out how the failures in administration, inter-departmental rivalries, improper planning, red-tapism, apathy, corruption, hostility between technocrats and bureaucrats and interference by influencial public men have all contributed to the low utilisation of the irrigation resources, besides creating added problems of water logging and siltation.

The Kosi Project, which was one of the first multipurpose major projects of the country, was launched with the objective of controlling floods and providing irrigation for about 1.58 million acres. However, the actual areas irrigated are much below the targeted figures and the author quotes from official records to show that only 18.2 per cent of the area is irrigated due to various reasons. Further, due to heavy siltation during kharif season the carrying capacity of the canals is reduced to 60 per cent of its original designed discharge. The uncontrolled and excessive use of water in the head reaches both in kharif and rabi, which is three times more in kharif and 13 times more in rabi, has resulted in low water use efficiency and created water logging problems.

Even though a Kosi Area Development Commissioner had been functioning since 1965, and was converted into Kosi Area Development Agency in 1974, many of the administrative bottlenecks still persist. The new Kosi Area Development Agency has been made a high-powered body but is virtually ineffective since it is based on technical diagnoses of the problem and has neglected institutional considerations like operating procedures of irrigation bureaucracy. The CAD Agency has no real authority to fix and enforce a cropping pattern, regulate the release of irrigation water accordingly and redistribute funds under various programmes to secure optimum results.

It is a sad commentary on the fact that the Government of India and the state government have not been able to take some tough decisions in the interest of development of irrigated agriculture. The decision whether water management, agricultural extension and allied matters should be under the co-ordinating authority created for this purpose or whether they should be outside this authority and continue to pull in different directions has not been taken even after an experience of nearly two decades. Water management instead of being with the co-ordinated agricultural production group continues with the Irrigation Department which has always tried to function in isolation.

Added to this, unequal distribution of water with big and powerful farmers taking away the entire water without allowing anything to go to lower reaches and cutting canals anywhere to suit their convenience have all aggravated the problem. The Command Area Development's most important function of equitable distribution of water is therefore neglected or remains ineffective.

Apathy and corruption have proved to be the stumbling blocks in the way of effectiveness.

The author strongly advocates formation of local associations of irrigation farmers consisting of users of the same water courses which could be an effective institutional means for not only solving local irrigation problems but also to work as pressure groups to safeguard their interests. This is supported by the evidence found in the CAD projects in Andhra Pradesh and Sharda Shayak in UP.

**Victor S. D'Souza**

Economic Development, Social Structure and Population Growth

The link between population growth and economic development is a hotly debated topic. Existing studies have utilised only the perspectives of demography and economics. Their analyses are based on the economic decision-making model which rests on the concept of children as durable consumer goods. This approach has now been found to be both inadequate and unrealistic.

Professor D'Souza has added a third perspective—that of sociology. His study throws fresh light on the complex issue of population and development. An essential reading for demographers, planners and policy-makers all over the world.

**140pp/225×140mm/Rs 85/1985**

**SAGE** PUBLICATIONS INDIA PRIVATE LIMITED

Post box 4215 New Delhi 110048

The silt and water-logging problems are attributed to the flows in kharif. As the rainfall in the command is above 50" and is normally sufficient for a rainfed kharif crop, the best solution would be not to run the canal in kharif except as supplement when rain fails and provide irrigation in summer when the water is free of silt.

In the above circumstances the author has recommended the closure of the canal during kharif season to avoid siltation of the canals and threat of water-logging of the low lying areas. This will provide an opportunity to attend to the repairs of the canals system during the kharif period. However, this will increase the pace of siltation of the reservoir bed which will ultimately affect the efficiency of the project.

Another alarming aspect to which the author has drawn attention is that in view of the adequacy of rainfall and availability of other sources, it was not at all desirable to have such a big canal system. Thus the expenditure incurred on having the canal system proved to be an infructuous investment though the project was successful as a flood control measure. However, the author has not suggested how the impounded water could be used. It may ultimately pose serious threat to the very safety of the dam.

The construction of such infructuous and badly planned projects is the result of absence of a strong multi-disciplinary planning group at the Central and state levels where all the implications of the construction of a project are looked into by experts belonging to all the disciplines concerned. The desire of political bosses to have a project during their own regime does not make possible such a detailed examination and the irrigation hierarchy does not consider it necessary to have such a multi-disciplinary group to delay its expenditure-oriented work. Many projects have therefore failed in one respect or the other and more serious attention has to be paid by governments to such infructuous expenditure. The money thus saved could be used for health, education and other useful purposes.

The author has complained that the Kosi Area Development Agency could not deliver the goods in view of certain procedural constraints. These procedural constraints have been found in all projects covered by Command Area Development Authorities all over the country but the rulers of the country have not yet been able to understand these problems and to take some hard decisions to make the development of irrigated agriculture possible at a faster pace and in a more organised manner and to put an end to the construction of inefficient, unwanted and infructuous projects.

Niranjan Pant has ably covered all aspects of the complex problem of irrigation utilisation and this book is an excellent contribution to the scarce literature on this important subject. It should be read by all persons dealing with the problems of Command Area Development, whatever their discipline or level in the hierarchy.

# Nepal's Economic Development

**Employment and Development in Nepal** by Rizwanul Islam, Azizur Rahman Khan and Eddy Lee; International Labour Organisation, Asian Employment Programme, Bangkok, 1982; pp vii + 122.

THE volume under review is in fact a survey of Nepal's overall economic situation done by some people connected with the ARTEP programme of ILO in Bangkok. It is a shorter version of a report prepared for the Nepal National Planning Commission.

One of the poorest and most stagnant countries in the world, the latest "World Development Report" of the World Bank lists Nepal fourth from the bottom, and with a slight negative growth rate of GNP over the period 1960 to 1982. Its problems are exacerbated by a difficult terrain subject to rapid ecological degradation and conditioned by being a small economy on the periphery of a large one. Perhaps one should say two large ones, but trade relations with China are relatively insiginificant. It is also the country that was the concern of a book published a number of years ago entitled "Planning without Facts" or some such and has a very limited statistical base for the kind of effort the volume under review represents.

The study goes beyond the broad income figures to specify Nepal's shortcomings in meeting such basic human needs as those for food, clothing, and housing, and the very unequal distribution of income in the country. The study asserts, incidentally, that landlessness is "not as widespread and serious" as in other South Asian countries, but the data hardly confirm this statment. The totally landless seem to be over 20 per cent of the rural population, *versus* perhaps 30 per cent in some neighbours and those with less than subsistence holdings perhaps 50 per cent, *versus* 60-70 per cent in some of the neighbours.

The ecological issue is discussed summarily, but presumably the source referred to, "Himalayan Ecosystems Research Mission: Nepal Report" (Economics Department and South Asia Institute, Heidelberg University, 1976) has a fuller coverage, as do several other well reviewed volumes on Nepal.

The report pinpoints the connection between the income inequality in Nepal and the possibility of rice exports in the face of widespread hunger. It urges the government to 'do' something about it—and then recognises that the government is perhaps not capable either of ending inequality or constraining exports in its present state.

In fact, the brunt of the report is a recognition of the rather narrow limitations on the Nepali government's ability to pursue an economic policy separate from India's and its need to carefully coordinate its policies with its larger neighbour.

Some of the thrust of the report is directed to the Indian relationship. For example, the recommended industrial policy is to "strengthen the domestic preconditions for industrialisation", "improve the terms and conditions for transit of Nepalese trade", and "lessen Nepal's economic dependence on India". This latter is to be accomplished by diversifying Nepal's trading partners. Apparently the currency exchange rate has been manipulated to this end and there has been some increase in third country exports of which some considerable portion goes to Bangladesh and much greater increase in third country imports. An alternative would presumably be greater economic integration with India—but this approach is clearly not endorsed, nor considered in this report.

# Functioning of Foreign Exchange and Financial Markets

## Some Key Issues

**S K Verghese**

*While recognising the need for encouraging flexibility and dynamism in the financial markets, the author wonders how much of what is happening in the name of innovation and sophistication is simple froth and how much of it is actual improvement to help serve the interest of the real sectors of the world economy.*

*The financial and foreign exchange markets are no longer hand-maidens of the real economy. They have assumed a life of their own. Unless the basic functions of the financial and foreign exchange markets are restored to serve the real sectors of the world economy, it is unrealistic to expect stability in the foreign exchange and capital markets.*

WHEN a generalised floating of currencies emerged in early 1973 there was widespread expectation that more stable rates than those that existed in the final years of the Bretton Woods era would prevail. It was believed that exchange rates would move smoothly in the free market to adjust for changes in relative prices. It was also held that since exchange rates would take the brunt of adjustment, countries with floating rates could conduct domestic policies to promote economic growth, employment and so on without having to worry about the maintenance of external equilibrium. However, experience of the last 13 years has convinced the world that exchange markets do not behave as was expected. On the contrary, exchange rates of all major currencies have undergone unprecedented magnitudes of volatility and misalignments. Though there is a great deal of controversy about the reasons for the high volatility and prolonged misalignment of currencies and also regarding the need for and the specific measures required to bring about greater stability in the exchange markets, there is a near unanimity among central bankers and financial analysts that, a return to a fixed rate system is neither feasible nor sustainable in the foreseeable future due to the widely divergent economic and financial conditions that prevail today.

### MAGNITUDE AND EFFECTS OF VOLATILITY

Due to the importance of the US dollar in international financial transactions and reserves, exchange rate upheavals now, as in the past, centre around the rates of the dollar against other major currencies. The magnitude of the volatility of exchange rates has been higher during the floating regime than during the Bretton Woods era. Volatility of exchange rate is generally defined as day-to-day, or short term variability of nominal rates, whether bilateral or weighted average nominal rates. According to IMF estimates "the weighted average monthly changes in nominal effective exchange rates among the major industrial countries was 0.2 per cent during the period 1961-70, and averaged almost 1.2 per cent over the period 1974-83, a six-fold increase ... Day-to-day changes in excess of one per cent and quarter to quarter changes in excess of 5 per cent have also been frequent."[1] After a period of relative calm in 1983 as compared to 1981 and 1982, the volatility of exchange rates accentuated in 1984 and the first quarter of 1985. For instance, between February 27, 1985 and March 28, 1985 the dollar fell as much as 15 per cent against the pound sterling and 11 per cent against the deutsche mark.

Volatility of exchange rates offers opportunities for gains as much as it exposes the parties to risks of potential losses. But banks can protect themselves by squaring their currency sales with an equivalent amount of purchases and *vice versa*, just as exporters and importers can reduce their risk exposure by taking recourse to forward cover. The problem in this respect is that many developing countries do not have a well-developed forward exchange market, and the facilities available are generally too expensive. It is also to be noted that forward cover may not fully eliminate currency risks as the maturity period of the cover may not coincide with the actual time taken between the date of the contract and the date of receipt/payment for the relative transaction for a variety of reasons. If the two do not coincide, additional costs may entail from extension/cancellation or early delivery, etc, of the original forward contract. However, it is possible to a large extent to protect oneself against the exchange risks arising in trade contracts. Experience with large exchange rate variability under the generalised floating regime has not only enabled the parties involved to develop expertise in managing exchange risks but has also encouraged many to develop innovative financing techniques for reducing the risks.

There is no consensus among analysts regarding the effects of exchange rate volatility on trade and investments. Some earlier studies have come to the conclusion that exchange rate uncertainty has had no significant adverse effects on trade.[2] Williamson dismissed the adverse effects of exchange rate volatility by saying "for all that, exchange rate volatility is a nuisance rather than a major source of concern".[3] A recent IMF study also came to a similar conclusion. However, this study cautioned that "the failure to establish a statistically significant link between exchange rate variability and trade does not, of course, prove that a causal link does not exist. It may well be that the measures of variability used are inadequate measures of uncertainty; that other factors overwhelm the impact of variability in the estimating equations, or the presence of statistical problems ... interferes with the effectiveness of statistical test".[4] However, a recent study by economists of Federal Reserve Bank of New York showed that volatile exchange rates have led to a significant reduction in the trade between West Germany and the United States.[5]

### MEASURES OF COST OF VOLATILITY

A related aspect is the cost of hedging exchange risks to exporters and importers. According to an IMF study, the cost of covering uncertainty of exchange rate variations is negligible as it is measured by the bid-offer spread in the forward exchange markets. The study pointed out that "while for an individual transactor the cost of forward cover may appear to be the discount from the spot rate, it should be remembered that this discount is matched by a premium facing those wishing to make transactions in the other direction. The net cost facing traders in the aggregate is the difference between the discount in one direction and the premium in the other (i e, the spread)." From this the study concluded that "since spread between bid and offer rates in the 3-month forward market have rarely exceeded 0.2 to one per cent for major currencies, the implicit cost of short term exchange rate uncertainty would appear to be too small to have a significant effect on aggregate trade flows".[6]

This interpretation of the cost of hedging exchange rate uncertainty does not appear to be appropriate. The spread in the foreign exchange rates, similar to those in the money market, represents the profit margin to the foreign exchange trader at the particular moment of time. Since the trader who gives the quote does not know whether the counter-party who is asking for the quote is a buyer or seller of the currency he perforce has to give offer and bid rates together in his quote, thereby incorporating a profit irrespective of which side of the transaction he finds himself. The bid and offer rates quoted are aligned with the ruling market trend at that particular moment of time. For instance, if the currency is at a discount in the forward, in the buying side (bid) the dealer will quote a slightly larger discount and in the selling side (offer) he will quote a smaller discount. This means that he intends to have a slightly larger discount if he is buying but is willing to give a slightly smaller discount to the counter-party if he is on the buying side. If the counterparty sells him the currency with a larger discount, he can still expect to make a profit by selling in the market the same currency immediately with a slightly lower discount than what he purchased. This is the rationale for the spread in the foreign exchange market. This spread is not really relevant for determining the cost of hedging foreign exchange risks to a trade customer. The cost of hedging is ambiguous and can be assessed from more than one point of view. If he is pricing his contracts in a foreign currency on the basis of the current domestic cost (plus profits), or a certain estimated average targeted cost, converted at the current spot exchange rate, the cost (or benefit as the case may be), is the absolute discount (of the premium) in the forward market. He loses if the currency is at a discount by the full extent of the discount and gains if the currency is at a premium to the full extent of the premium. This cost (or gain) is minimised if the trader is able to incorporate the discount (or premium) in the price itself at the time of quoting the price. Normally if the interest differential is not changing significantly in short periods, the forward margins remain fairly stable in short periods which helps in pricing the transaction appropriately. Due to the volatility of interest rate in recent years there has been significant changes in the forward margins, making it difficult to incorporate this element in the pricing formula. Besides, in the international markets normally when a currency is at a premium the buyers take advantage of it by bidding down the price to that extent. But a similar willingness to tolerate a hike in price to the extent of the discount is seldom encountered. This advantage is not available to developing countries where the forward margin-interest differential parity seldom holds good. Another way of looking at the problem is in terms of the opportunity cost, i e, the loss of an opportunity to gain because he has hedged his transaction in the forward market. This cost is measured by the difference between the contracted forward rate and the actual spot rate on the maturity date of the forward contract. If the forward contract rate is at a discount while the spot rate on the maturity date has actually appreciated he loses an opportunity to gain because he has hedged his currency exposure in the forward market. In any case the spread between the bid and offer rate is not appropriate for measuring the cost of hedging exchange risks.

## MISALIGNMENT AND ITS IMPLICATIONS

For the purpose of judging misalignment, what is relevant is the real exchange rates, effective as well as bilateral rates. There is much disagreement among analysts about the definition of misalignment and its measures. Traditionally the magnitude of the misalignment or 'over-shooting', as it is some times termed by central bankers, is assessed from the standpoint of the rates warranted by economic fundamentals such as current account balance and changes in relative prices. A broader concept of equilibrium exchange rates has been used by some analysts to measure the degree of misalignment.[7] Unlike in the case of volatility, the general view is that misalignment of exchange rates, being unsustainable in the medium and long run, can impose significant costs to the economy by giving wrong signals for resource allocation which will have to be corrected when the exchange rates reverse subsequently. Williamson defined fundamental equilibrium rate as "the rate which is expected to generate a current account surplus or deficit equal to the underlying capital flow over the cycle, given that the country is pursuing internal balance as best as it can and not restricting trade for balance of payments reasons". According to his estimates, in the first quarter of 1983 the dollar was overvalued to the extent of 18 per cent and the pound sterling by 11 per cent over their 1976-77 levels. His findings were that the deutsche mark and the yen required a nominal appreciation of about 18 and 15 per cent, respectively, against the dollar to esablish fundamental equilibrium levels. In a study of the dollar-yen relationships for 1983 an economist of the Federal Reserve Bank of New York came to the conclusion that from a macroeconomic and trade point of view, the dollar was too strong but yen was not particularly weak. He further concluded that "Japan's recent gains in competitiveness against the United States have resulted from an overall strength of the dollar and not from any overall weakness of the yen".[8]

In view of the complexity of the interactive process of exchange rate variations on the balance of payments and the latter on exchange rates and also due to the sharp differences in the views of policymakers about what economic factors are more relevant for assessing the appropriateness of exchange rate levels, the Working Group on Exchange Market Intervention (1983) observed that the "assessment of the appropriateness of the exchange rate has to rely essentially on eclectic, qualitative judgments".[9] This approach being the one in practice adopted by all authorities on the major countries, obviously there is little agreement on whether there exists a misalignment and if so, what is its magnitude. Each country interprets its exchange rate level from its own national point of view rather than adopting any automatic technical measures. Though there is much disagreement regarding the precise magnitude of misalignments, each of the concerned party claimed that in the period 1976-79 in the case of the deutsche mark, 1977-78 in the case of the yen and 1980-1985 (first quarter) in the case of the dollar there was marked misalignments from the rates warranted by economic fundamentals. The potential for the market to overshoot has been recognised by the IMF. According to the IMF, in a narrow sense one can even say, in the absence of intervention by the authorities in foreign exchange markets, exchange rates are always at equilibrium levels since they are simply a reflection of the preference and expectations of market participants engaged in free and open trading based on information available to them. But that observation does not imply that serious misalignments cannot occur in terms of the relative prices at which international trade takes place. Whenever stable economic and financial conditions are absent, developments in financial markets can lead to swings in exchange rates that while reflecting the free play of forces in the foreign exchange market may not be consistent with the functioning of the adjustment process in the goods market.[10] Thus, the free market price in the foreign exchange market is only a limited market-clearing price and it is not an indicator for efficient allocation of resources globally. This feature is indeed a serious handicap when considered in the context of the sole role assigned at present to free market forces to allocate resources without any interference from the governments. Subsequently when exchange rates again overshoot on the reverse side, the reverse process of adjustment also gets exaggerated affecting the efficiency of resource allocation in the second round. If these swings witnessed in the last 13 years are to continue in the future, as can be expected, it is to be recognised that efficient resource allocation globally cannot be ensured if it is left entirely to the market forces.

### VULNERABILITY DUE TO INHERENT DEFECTS

There are many basic reasons for the wide swings and misalignments of currencies. Some of these have become permanent features of the international financial system. One of the important reasons for volatility and misalignment is the fundamental change that has come about in the nature and motives of the market participants, in the process of functioning of the market and in the facilitating environment of financial and foreign exchange transactions. The second but allied reason is the easy availability of enormous liquid funds and the complete freedom and facility to move these funds across national frontiers. The floating of currencies and the ensuing volatility have encouraged banks, finance companies and even non-financial corporate entities to reckon their foreign exchange dealing rooms as profit centres rather than as service centres. Earlier when banks used to pool their innumerable customers' genuine foreign exchange requirements, they appeared on both sides of the market thereby providing stability to the movements of exchange rates. At present only less than 5-6 per cent of the total volume of business of about $ 200 billion per day is attributable to genuine commercial transactions, the overwhelming balance being accounted for by 'cable game', i e, just buying and selling of currencies to take advantage of the intra-day and short run exchange and interest rate movements. These transactions in the wholesale market are undertaken by banks, other financial institutions and large corporate entities, including pension funds, money market mutual funds, etc. The number of such institutional participants are obviously small as compared to the large number of small commercial customers. In terms of number of participants and the volume of their business, the foreign exchange market is a monopolistic market.

Since the current spot exchange rates are influenced by their expected future rates, and all known information is already incorporated in the current rate, it is only new information or changes in the interpretation of existing information that can affect exchange rates. Due to the revolution in telecommunication facilities the same information is available simultaneously to all the market participants. Since generally the information is partial and most of the participants have managed to acquire market skills only at the dealing desks, their confidence levels are not sufficient to enable them to take an independent view of the market. Therefore, their views are influenced by what they perceive as the views of the market leaders. Since the amounts of the deals involved are very large, the majority of the dealers hesitate to go contrary to the views of market leaders. This process accentuates the trend in the market and results in prolonged undervalutation or overvaluation of currencies in phases. In terms of the number of participants involved, and the process of their decision-making and also the enormous volume of business transacted by each, foreign exchange markets are free markets only in name. The emergence of futures markets in foreign exchange in many financial centres has further accentuated this distortion. The foreign exchange market has tremendous potential for 'bandwagon' effects for prolonged periods, the more the uncertainty and the higher the volume of business, the greater the potential for such accentuated 'bandwagon effects'.

Another contributory factor is the availability and the freedom for capital movements. The progressive dismantling of all barriers to fund movements, the availability of instant financial information, the facilities for instantaneous transfer of funds, the development of specialised institutions to manage portfolios and above all the official encouragement to market participants to earn from banking and allied service sectors in order to compensate the loss to countries on their trade front are some of the reasons for the enormous upsurge in capital flows in recent years. Even the governments/central bankers who have so far been reluctant to liberalise their financial markets completely are now increasingly changing their policies. France and West Germany which have long resisted opening up completely their financial markets to innovative techniques of the Euro-currency markets have recently begun to reverse their approach. The idea seems to be if "we cannot beat them, let us join them".

The ability of governments to control some of the key macro-economic variables such as exchange rates and interest rates has been eroded to a large extent by the market developments in the 70s and the 80s. While recognising the need for encouraging flexibility and dynamism in the financial markets, one wonders how much of what is happening in the name of innovation and sophistication is simple froth and how much of it is actual improvement to help serve the interest of the real sectors of the economy. The financial and foreign exchange markets are no longer hand-maidens of the real economy. They have assumed a life of their own. Unless the basic functions of the financial and foreign exchange markets are restored to serve as hand-maidens of the real sectors of the world economy it is unrealistic to expect stability in the foreign exchange and capital markets.

### LIMITED EFFECTIVENESS OF CENTRAL BANK INTERVENTION

In the context of the present structure and functioning of the foreign exchange markets the consensus of central bankers is that market intervention by central bankers, though at times it may prove useful to counter disorderly market conditions, is ineffective in maintaining a specific exchange rate or target levels against strong market sentiments. There was a time when it was believed that co-operative intervention by all the major central banks, by indicating strongly the direction that the monetary authorities believe the market should be moving, could achieve some measure of success. But the concerted intervention by many central banks in the first quarter of 1985 proved beyond doubt the ineffectiveness of such efforts in bringing about any substantial change in the market trend. On the other hand, the market has become more bold after that as they had proof of the central banks' inability and unwillingness to continue market intervention.

Monetary policies, unless they are too restrictive or too expansionist, also have their limitations. In this respect it is important to recognise that the relationship between interest differentials and exchange rate movements is complex and ambiguous. Interest differential and expectation of future exchange rate changes together are the main determinants of portfolio allocation and hence capital flows. Thus, when the interest differential in favour of a currency is declining, capital flows into that currency can intensify if the expected future appreciation of the currency more than compensates the decline in interest earnings. In this respect what matters is the nominal interest differential. Foreigners who are investing in short term financial instruments in a country are not affected by the inflation rate in that country, they could as well spend their earnings in their home country, which is usually the case, or elsewhere. But inflation rate can have an effect on yield computation through its effect on future exchange rate changes. Here again what matters is the expected inflation differential rather than current inflation. It has been found that at times the motivation for portfolio reallocation is to gain from asset price rise due to an expected decline in interest rate. Therefore, even when a currency is expected to depreciate and interest rate differential in favour of it is narrowing, increased capital inflows may still take place. Probably it is due to this type of complex relationship between changes in interest rates and changes in exchange rates that it has become difficult to find a consistent statistical relationship between changes in the interest rate differential and changes in the exchange rate of the dollar during 1980-84 period.

## CO-ORDINATED ECONOMIC POLICIES MAY PROVE INEFFECTIVE

Since capital flows constitute the key factor in the persistent misalignment of major currencies, and changes in yield expectations are caused by divergent underlying economic policies, there is a convergence of view that co-ordinated economic policies are a necessary condition for establishing stability in exchange rates. According to the IMF "it is becoming increasingly apparent that the smooth functioning of the exchange rate system requires stable underlying conditions in the major industrial countries, including low rates of inflation, sustainable growth of real incomes and a stable pattern of financial conditions".[11] The need for co-ordinated economic policies has been repeatedly emphasised by all concerned ever since the gyration of the exchange rates under the generalised floating arrangements began in 1973. So far there is no evidence that any positive steps in this direction are taken by the authorities concerned. It is unlikely that any effective measures will be taken in the future also. Besides, no practical set of co-ordinated economic policies that can be reasonably conceived, can bring about a durable environment, in which expectation of future yields of a multitude of financial instruments. in a multitude of related markets, can be ensured. As already indicated, the structure and functioning of the foreign exchange and financial markets constitute a very unsatisfactory and weak framework and tool for the efficient allocation of financial resources globally. Financial markets of today are oversensitive. The allocation of financial resources resulting from impulse and gut feelings based on inadequate information can hardly be expected to be an efficient system. Besides, interest differential is not a true reflection of the differences in the marginal productivity of capital. It is well known that in the case of dollar and the recent capital inflows into the USA, it is the domestic financial disequilibrium, arising from the enormous budget deficit, that is the underlying factor rather than any significant improvement in the relative productivity of the US manufacturing sector. It cannot be claimed that this is a sound ground for reallocating international capital on such an enormous scale to the USA.

The irony in the functioning of the present international financial system is that the richest and the largest economy of the world is enabled to enjoy the bulk of the savings of the world, to support its higher economic growth, consumption and military expenditure. By 1983 the USA has become a net borrower abroad. Since then it has been borrowing at a rate in excess of $ 100 billion a year, which according to Paul Volcker, Federal Reserve Board Chairman, is about 15 per cent of the total net savings of all the OECD countries put together. If this trend continues, the net external debt of USA may exceed $ 1,000 billion in 10 years' time. Thus, the most affluent country in the world, instead of contributing out of its savings to the development of the less affluent countries, is pre-empting the bulk of the savings of the world from being used elsewhere. Another important aspect is that the bulk of the capital inflows into the US is not for real investment purposes, in fact foreigners were net sellers of stocks in the US market during this period. The great part of the capital inflows into the USA has been invested in short-term instruments, including bank deposits.

Yet another disturbing feature of the capital inflows, *viz*, the unprecedented appreciation of the dollar, by hurting the competitiveness of US exports and import substitutes has further worsened the trade balance. This has triggered protectionist pressures in the US.

In the international financial ethos of today, it is out of fashion to expect those who benefit from the economic activity of their country, and hence amass enormous surpluses, to ensure its continued prosperity by reinvesting their surplus there. Similarly, it is also out of fashion to expect affluent countries in the world to contribute towards the capital formation of less affluent ones and in that process ensure a more diversified and durable global economic growth. The process of allocation and re-allocation of capital with the sole motive of maximising expected short run yields has become the 'be-all, and end all' of the international financial system. The real challenge facing the world community and policy-makers is how to let dynamism and innovative spirit of the financial and foreign exchange markets grow but yet keep a strong hand on the 'tiller' so that the destructive elements of these forces are kept under effective check.

# Historical Roots of Mass Poverty in South Asia

## A Hypothesis

**Tapan Raychaudhuri**

*The contemporary phenomenon of underdevelopment is not a continuation of the traditional economic order of pre-modern times. The patterns of economic organisation and levels of economic performance in the traditional societies of Asia, before they were enmeshed into the international economy created by first the merchant and later the industrial capitalism of western Europe, were significantly different from their contemporary counterparts.*

*In the case of India, the pre-colonial economy in its normal functioning did not generate large groups of half-starving people. The author traces the roots of mass poverty in India, as we know it today, to the new institutional framework of agriculture introduced after 1813 which deprived small holders, both tenants and proprietors, of nearly all their surplus, if it did not actually reduce them to landlessness.*

*Not only the new institutional arrangements, but even the positive developments in agriculture augmented the traditional disparities of India's agrarian society. Thus development of a market for cash crops implied a change in the ratio of non-food crops to food crops until, with increases in population, the output of foodgrains per head of population declined quite sharply. And where irrigation provided the means of increasing productivity, those in control of large holdings tried and increased their holdings, often at the cost of the poorer agriculturists.*

*The all-too-familiar phenomenon of today's mass poverty was thus already an established fact of life by the time population began to increase at a steady pace. Thereafter, given the pyramidal structure of rural society, there was a concentration of the increasing numbers in the lower rungs, until the very poor accounted for a half or more of the rural population.*

THE approach and method adopted in this essay are very much those of what is now described as 'old economic history'. This implies an emphasis on the qualitative rather than the quantitative, on arguments historical rather than economic in their essence. Of course, any such distinction is, beyond a point, artificial. The reason for this preference goes beyond deficiencies in one's training which are considerable. Where quantitative data are not available—on such crucial matters as national income and population—the attempt to squeeze the blood of aggregated series from the stone of fragmentary evidence is more courageous than prudent. Secondly, this paper is an attempt to present in a few pages the main ideas in what, hopefully, will emerge some day as a medium-sized volume. Some of the statements are hence in the nature of shorthand: the very considerable differences over space and time are 'de-emphasised' and the focus is on the uniformities rather than the variations without, one hopes, distorting the essential historical reality. Finally, the imprecision which marks most of the statements which follow is not accidental. It represents what, to my understanding, is the closest approximation to our present level of knowledge and possible perception.

Let me begin with an imprecise definition. Mass poverty is a situation where very large numbers in absolute terms and a very large percentage of the population suffer from a chronic shortage of food and other basic consumer needs like clothing, adequate housing, medicine and education and hence are victims of ill-health, disease, reduced longevity and ignorance. In any Third World country the phenomenon is obvious to any casual observer, and objective assessments only help to confirm with some precision the first impression of untrained eyes. One of the less complex definitions of poverty equates it with levels of income barely enough to secure the minimum of food—i e, caloric intake—required to sustain the human body. In recent years, it has been estimated, some 45 per cent to 53 per cent of the rural population in the territories of the Indian Union have had incomes around or below that level. The situation in the sub-continent as a whole is surely not better. In other words, somewhere between 250 and 300 million people are in conditions of near starvation in that part of the world. These figures represent something like 2½ to 3 times the number of the sub-continent's estimated population around the year 1600. Two other well known facts from the contemporary situation have a relevance to our understanding of the historical process which generated this phenomenon. First, not every one in South Asia is poor. Leaving aside the Birlas, the Tatas and Pakistan's 200 families, there is a large slab of urban and rural population with a very comfortable and rising standard of living. These are the beneficiaries of the very substantial growth achieved by the territories in question, which is the second well known fact I wanted to emphasise. True, per capita income remains low in South Asia but it is not so low as to keep consumption at the level of bare subsistence or below it for such vast numbers. What is perhaps more important, the self-sufficiency in food achieved by the Indian Union has not, so far as one knows, affected the quantum of food consumed per head by the rural poor. Nor has the emergence of India as a major industrial nation made any significant difference to the percentage of people below the poverty line. In one view, the percentage has actually increased. Without getting involved in that rather inconclusive debate, I would like to emphasise a central fact: growth and development have by-passed a very large section of the population which remains hopelessly poor. I shall later argue that this end result is built into the historical circumstances which explain the emergence of mass poverty in South Asia.

### MYTH OF OVERPOPULATION

Students of economic underdevelopment have recognised for some time that the contemporary phenomenon of underdevelopment is not a continuation of the traditional economic order of pre-modern times. The patterns of economic organisation and levels of economic performance in traditional societies of Asia, before they were enmeshed into the international economy created by first the merchant and later the industrial capitalism of western Europe, were significantly different from their contemporary counterparts. To take one elementary fact into account, the prevalent image of the underdeveloped world today is one of overpopulation. For the Indian sub-continent, such a description would have been of very little relevance as late as 1921 when its population was below one-third of the present level. In the seventeenth century, the corresponding proportion was probably nearer to one-eighth, though one estimate puts it as high as one-fifth. To take a different criterion, Kuznets estimated that the income per head of population in the traditional societies of Asia was probably higher than that in the pre-industrial phase of modern industrialised nations. In the Indian case, there is some direct evidence to support such a proposition. The Ain-i-Akbari gives the average yield per unit of three qualities of land—good, medium and inferior. A well known Indian statistician has estimated that the wheat yield for Abul Fazl's medium quality land compares well with the highest yield of post-Green Revolution Indian agriculture. Early 19th century accounts of yield per acre in Awadh, in eastern UP—then described as the 'garden of India', now a chronically deficit area—quotes figures which are higher than those available for England after the agricultural revolution. The implications of such nearly incredible evidence, confirmed by Buchanan-Hamilton writing in the first two decades of the nineteenth century, have to be tempered with reference to a negative fact he mentions, namely the uneconomically high ratio of crop to seed as compared with Europe at that time. Still the central fact relevant for our purpose is beyond doubt: a very favourable man-land ratio, and a technology evolved from long experimentation to make the best possible use of given resources, generated very high yields both per unit of land and per head of population. If economic underdevelopment as we know it today is not a pre-modern phenomenon, one of its characteristic manifestations—food deficit—is certainly even less so, at least so far as the South Asian sub-continent is concerned.

One could still argue that since pre-modern technology and pre-capitalist economic organisation implied inflexible ceilings to per capita income, and vast disparities in wealth and income were characteristic features of the pre-colonial Indian economy, mass poverty could still be one of the negative inheritances from the pre-colonial past. In fact, some of the evidence from Mughal times would support such a conclusion. All foreign observers of the Mughal economic scene invariably emphasise the contrast between the spectacularly conspicuous consumption of the Mughal nobility and the meagre livelihood of the urban artisans, the relative absence of a middle class in northern India, the extreme arbitrariness of the ruling class *vis-a-vis* the peasantry, who had to yield up 50 per cent of the gross produce to the state on pain of loss of liberty and break-up of their families, and the ultimate horrors of famine and war reducing multitudes to utter destitution. None of these observations are fallacious in themselves, but taken with other evidence and read between the lines, they do not, I submit, project a picture of mass poverty or at least anything remotely comparable in magnitude to the contemporary phenomenon to which we apply that term.

## Poverty in Pre-Colonial India

Let us first consider the urban aspects of the question. While destitution was not unknown—I shall try to explain its economic origins later—not one observer mentions the army of deformed or starving beggars one invariably encounters in the towns and cities of South Asia today. Housing of all but the wealthy was constructed of flimsy material, but again we hardly come across any descriptions of urban slums in the writings of the 17th and 18th centuries. The urban poor who evoked the sympathies of the Dutch factor, Pelsaert, were mostly artisans and shopkeepers subject to the arbitrary demands of the nobility who, allegedly, paid them little and often enough only with strokes of the Korah, or the cat-o'-nine-tails hanging at each nobleman's door. The same artisans, according to his own account, could however afford ghi with their evening meals—incidentally, beyond the means of all but the affluent in contemporary India. In the illustrations of the "Ain-i-Akbari", the artisans are shown as wearing simple tailored upper and lower garments, head-dresses and footwear—more than most of their contemporary counterparts can afford. The pay scales mentioned in the same account cover a range which would allow, according to the food prices quoted by Abul Fazl, a reasonable to very comfortable existence, though by no means anything approaching wealth. The Mughal cities and camps on the move attracted such artisans, workers and petty shopkeepers by the thousand and at times hundreds of thousands, without the incentive of the Korah. In an agrarian economy with plentiful supply of land and a small population where shift to agriculture from other occupations was always possible, the type of response just mentioned suggests that pull rather than push factors were at work. And since such people were the core of the city poor described by the foreign observers, we do not see in them the pre-colonial counterparts of contemporary mass poverty. In fact, they are actually reckoned among the petty hoarders of gold and silver who, by disgorging their nest-eggs, contributed to the inflationary situation at times of famine.

The rural scene is in many ways more complex. First, one encounters a wide variation in levels of economic performance. An outstanding example of high agricultural yield and plentiful supply of every variety of food-stuff was Greater Bengal, a region free from recurrent famines for some two centuries down to 1770. The bulk of such areas, which included Malwa in Central India and Awadh, was characterised by what may be described as 'affluent subsistence', i e, an economy geared to production for purposes of consumption rather than exchange, but having high levels of output and consumption attained with relative ease and rather small inputs of labour, permitting a fair measure of slack which could be taken up as and when the economy responded to market incentives. In areas characterised by such abundance of food-supply—parts of which were actually exported—inadequacy of food and clothing was unlikely to have been the lot of large numbers, whatever the pattern of income distribution. The possibility of such shortages affecting sections of the population cannot, however, be precluded for less fortunate regions, especially those like the South Coromandel coast which habitually imported food from the surplus areas. However, the pattern of regional variations suggests that the fate of the agrarian classes, often described by the foreign observers as semi-servile in view of the rapacity of the ruling classes, was at least not uniformly miserable.

In fact, the economic consequences of a rapacious ruling class and a very high level of revenue demand have apparently been misunderstood by the foreign observers upto a point, as their own evidence indicates. First, the rapacity of the ruling class—despite the system of frequent transfers of revenue-extracting officials—was limited by their own self-interest. The hereditary surplus-extracting cultivating zamindars had a long-term interest in the survival and prosperity of the peasantry and often acted as a buffer against the more transient class of officials. The official class itself, besides being limited by their own organisational inefficiency, had to reckon with the fact that people, not land, was in short supply. The oppressed peasants could always protest with their feet, migrating *en masse* to areas where their welcome would take the form of reasonable demands on their output. That they protested often enough with guns, bows and arrows and successfully defied unreasonable claims is evidenced by the foreign accounts as well as indigenous sources. The widespread use of fire-arms by the peasantry itself suggests a level of income well above subsistence. It is also known that such peasants as successfully defied the land revenue demand were exceedingly prosperous. It is unlikely that the Mughal state could as a rule collect the 50 per cent of the produce which at times was the level they did aim at. The state's concern with agricultural prosperity was also real, being rooted in self-interest as well as a conscious ideology. The concern was expressed *inter alia* through the system of revenue itself which imposed lower rates of demand per unit of land if the more highly priced cash crops like indigo, opium or mulberry for purposes of sericulture were cultivated. In other words, both variations in the natural levels of productivity as well as the operations of state policy permitted differences in wealth and income in the agricultural sector, both as between regions and within the same region. One end of the spectrum was surely close to modest affluence, if not substantial wealth. The contemporary accounts emphasising the arbitrariness of the ruling class project a blanket picture of rural misery which thus does not stand up to scrutiny. The expansion of exchange activity in the countryside, fostered by the increasing collection of revenue in cash and facilitated as much by the cross-country roads built by the Mughals as by the influx of bullion from the new world, and evidenced by the 3,200 *qabas* or rural market-towns mentioned in the "Ain", further suggests the existence of focal points of prosperity in rural-agrarian society. In short, the rapacity of the nobility was real. The resilence of the agrarian economy, its capacity to evade, curb and survive that rapacity and thus enjoy at least some share of the benefits derived from abundant supply of obviously very fertile land, was no less so. The economy which supported the colossal structure of the Mughal state and rendered possible its monumental constructions obviously generated a very large surplus. It is unlikely that a level of output from which such extraction was possible could be maintained for nearly two centuries without positive incentives to the producer. The known facts regarding the Mughal polity cannot be squared with any picture of a uniformly immiserised peasantry. The question to ask then is whether, despite very high levels of output rendered possible by abundant supply of fertile land and, despite the evidence for considerable agrarian prosperity, large sections of the rural population suffered from extreme poverty, especially near-starvation.

## NO CHRONIC FOOD SHORTAGE

In all probability, if we are looking for the seeds of mass poverty in the pre-colonial economy, the structure of agrarian society, inter-acting with the rapacious tendencies of the Mughal jagirdars, does provide a clue. The pre-colonial village in India was nowhere an undifferentiated egalitarian society. While its structure varied from region to region. it contained everywhere a top layer of 'superior rights' in land—usually a group belonging to high or agricultural castes who emerged as full-fledged proprietors if a land-market developed—another group with equally hereditary rights, but comparable in terms of village servants producing goods and services mostly, but not exclusively, in return for hereditarily fixed shares of the village produce. This third group included service castes whose professions were considered defiling and whose perquisites were very small and others who had duties on land but no sort of recognised rights to it. In parts of southern and western India (Gujarat and the Deccan), the third group contained an important part of the work force in agriculture—agrestic slaves and serfs without any rights in lands but cultivating it for proprietors belonging to superior castes and receiving what was in all probability a bare subsistence. The lowly service castes without rights to land in the northern regions were unlikely to have been better off. In normal times such groups evidently had enough to live on. This is a logical assumption for an economy producing an abundance of basic consumer goods, and that for consumption rather than exchange. There is no economic incentive to starve a section of the work force in such a situation. But in times of famine, or when warfare dislocated production, they were the first to be pauperised, that is if they did not actually perish. Describing the Great Famine of the 1630s, Peter Mundy mentions regular movement of grains and shops full of food-stuff and people dying within sight of both for lack of money to buy. The lowest strata of the rural population, perhaps without even the nest egg of hoarded silver or gold to fend off the first onslaught of scarcity, were no doubt the first victims. If they survived, the chances were that they did so as paupers. It is unlikely that such flotsam and jetsam were all easily accommodated within the structure of established rural communities. The relatively easy availability of general labour for road building and other public works, in even remote parts of the country—without recourse to forced labour—indicates the existence of a fairly sizeable floating population. War and migration probably contributed to their numbers. The question as to why such displaced sections of the rural population, like the migrant agriculturists, did not take advantage of the abundant supply of land is not easily answered. Capital, even the small quantum required to start cultivation or reclaim land, was not in abundant supply and the phenomenon of low caste village servants living on the margin of subsistence even in normal times suggests that entire social groups were excluded from any access to it. To repeat, the historic roots of mass poverty are probably traceable to the existence of these social groups on the margin of subsistence in rural society. However, some facts are worth emphasising in this context. Neither the *a priori* conclusions derived from the known facts of man-land ratio nor the direct evidence available indicate any chronic shortage of food supply in any part of the sub-continent (deficit areas being supplied from food surplus regions). The most distressing feature of contemporary mass poverty is inadequate supply of food. This phenomenon was, at least until recently, linked both to inadequacy of total output and availability, as well as of purchasing power. At least the first of these two deficiencies was absent from the pre-colonial scene. In rural India, the supply of food was dependent on the producer's own effort or, in case of those not deriving their livelihood primarily from their family holding of agricultural land, on the share of the village produce customarily allocated in return for services required. In a situation of relatively high productivity—one can assume—even the small family holdings must have produced yields, net of all liabilities including revenue demand, which guaranteed at least an adequate supply of food, probably much more. As to the hereditary village servants, even the lowliest of them are unlikely to have lived for generations on the brink of starvation when food was available in plenty, however inegalitarian the character of Indian rural society. True pauperisation was hence, in all probability, the result of abnormal, if recurrent circumstances, and the subsequent failure to resume the customary economic function. Such displaced elements may well have included segments other than the lowliest service castes, but the better off with their cattle stock and small savings had more sustaining power and hence better chances of recovery. If, then, the hard core of absolute poverty is to be sought among the displaced bottom strata of service castes, one must remember that they constituted a small percentage of the rural population. In the north, the bulk of the work force in agriculture accounting no doubt for the great bulk of the population consisted of the 'right-holders' family labour, so that castes with duties on, but no rights in land, constituted a small minority. Even if we add to this the lowly non-agricultural service castes, the total numbers could not have been large. In the south, the low castes in semi-bondage or actual bondage played a more important role in agricultural production. This fact, however, is likely to have facilitated their rehabilitation after economic catastrophes. Such circumstancial evidence suggests that those who did not have enough to live on could have accounted only for a small proportion of the rural population in pre-colonial India. By no stretch of imagination could this population have been anywhere near 45 per cent. The direct evidence bearing on the question—the substantial body of descriptive accounts—supports my conclusion.

In short, the pre-colonial economy in its normal functioning did not generate large groups of half-starving people. However, the recurrent shocks to the system regularly threw groups out of the system reducing them to penury, but such groups accounted for a relatively small part of the population. The warfare and the rapine associated with the downfall of the Mughal empire, the Maratha aggressions and the establishment of British rule subjected the economy of vast areas to continuous shocks from the 1680s to 1803 and in some cases, like Awadh and the Punjab, even much later.

## ECONOMIC CONSEQUENCES OF EMPIRE-BUILDING

In considering the record of the colonial era, it is necessary to emphasise the relevance of a very obvious but often forgotten fact—that there were two distinct phases of colonial rule in the subcontinent. In the earlier phase, the East India Company's monopoly shielded the territory from virtually all impact of industrialisation in Britain, so that the characteristic features of colonial trade and all associated phenomena, postive or negative, could emerge only after that monopoly was effectively undermined in 1813. In the first half century, and for some regions like Oudh much later, the economic consequences of empire-building were predominantly negative. I shall consider only such features of these negative developments as are relevant to the present enquiry. In the Presidency of Bengal, both the early efforts of the Company to organise a regular flow of revenue and the less orderly rapacity of its servants, some of whom came out to India on a pay of a few pounds a year and went back with fortunes estimated in millions—had disastrous effects on the economy, at least in the short run. The large scale abandonment of cultivation, a direct response to unbearable revenue demand and the pressures to buy and sell at dictated prices—which contributed to the Famine of 1770, killing off something between a third and a fourth of the population according to the company's estimate—has no recorded precedent in Indian history. In Madras, the English creditors of the Nawab of Arcot held the revenue of several districts as ransom and acted more like usurious moneylenders than administrators. Oudh under the Subsidiary Alliance suffered a similar fate. These horror stories of the period of plunder are of some relevance to our enquiry. India was certainly not a stranger to war and rapine. But together with Aurangzeb's devastating wars in the Deccan in the last quarter of this 17th century and the intensive plunder undertaken by the Marathas in the 18th century, the Company's exercises in rapacity add up to a record of intensive economic dislocation affecting very large parts of the territory and spread over a period of some 150 years. Compared to these annals of desolation, earlier catastrophes appear to have been either brief or relatively superficial rendering a return to *status quo ante* a comparatively easy task.

No doubt the gradual establishment of

ULKA-GB-PR-9-83

a modern and orderly administration healed many of the wounds inflicted by the long period of disorder and direct plunder. But perhaps not all wounds were effectively healed. Two of the most prosperous regions of the Mughal days emerge as agricultural lame ducks of the modern era. Eastern UP, the erstwhile 'garden of India' according to the Company's observers, remains an impoverished area. In Bengal, during the period for which statistics are available, there was an absolute decline in the production of foodgrains. These were two territories which had suffered most from intensive though short-lived plunder. A causal connection between these two sets of facts is not improbable. A different consequence of the catastrophes is more germane to the present discussion. The rehabilitation of the most vulnerable elements in society after any economic dislocation was the most difficult and least likely part of post-war and post-famine situations. As will be argued later, the political economy of colonial India, even its most constructive elements, was heavily tilted against the have-nots. The flotsam and jetsam thrown up by the disintegration of one empire and the establishment of another are unlikely to have returned to any orderly economic existence. We know that the Famine of 1770 generated large groups of desperadoes in Greater Bengal. We also know that Pax Britannia eventually curbed them. It is unlikely however that the disarmed bandits became once more modestly prosperous agriculturists, rather than destitutes earning a precarious living. Those who shared a similar fate in other parts of the sub-continent were certainly numerous. A prolonged period of economic chaos had generated a numerous army of paupers. Circumstantial evidence suggests that the efforts at reconstruction must have reinforced their economic vulnerability.

## NEW INSTITUTIONAL FRAMEWORK OF AGRICULTURE

In many ways, the Indian economy continued along its familiar path until 1813; only its course was modified by the series of shocks spread over a long period which generated, *inter alia*, a hard core of extreme poverty. After 1813, with the abolition of the Company's monopoly, the region is drawn, under conditions of colonial control, into the international economic network created by industrial capitalism. The causal relationship of this fact with the articulation of the characteristic features of underdevelopment remains a subject of debate. For purposes of the present discussion it is not essential to get drawn into it. We can instead concentrate on the broad contours of the economic record which are fairly uncontroversial. The record, it seems, is one of modest quantitative expansion, mainly in traditional agriculture, in response to demand in the world market and some deepening of the domestic market through infrastructural investment and other factors. Since throughout the 19th century, the area under cultivation was extended at a rate higher than the rate of population growth, it is likely that the extension was achieved by taking up the slack in labour supply. Diversion of labour from manufacture, some lines of which could not cope with the competition of machine manufactures, may have contributed to the process. But since the evidence does not suggest conclusively any absolute or perhaps even relative decline in employment in the manufacturing sector in the long period, it is safe to assume that substantial extension of cultivation under conditions of modest population increase meant some increase in output per worker, modified by the taking up of less fertile land under cultivation. Judging by the statistical evidence of the later period, 1890s onwards, increase in the productivity of land was infinitesimal, though the benefits of movement to higher value crops and specialisation are likely to have increased the value of yield per acre. Taken with the growth of a modern sector and a very substantial expansion of trade (in absolute rather than per capita terms), there were modest increses in per capita income of about one per cent or less per annum between 1891 and 1911. Any estimates for earlier periods are highly undependable guesswork. It was believed until recently that when for the first time the population began to increase at a steady, though still very modest, rate of around 1.3 per cent after 1921, per capita income began to fall. While this view has been questioned, the picture that emerges is at best one of near stagnation. In the first half of the 20th century, agricultural output per capita declined and the decline in the production of foodgrain was substantial. Net imports did not adequately make up for this decline, so that the availability per capita also declined. This record of modest quantitative growth in traditional agriculture tapering off as the population began to increase at a steady rate, has to be placed in the context of structural stagnation. Even the most optimistic estimates do not suggest that the ratio of agriculture to other sectors as sources of income and employment underwent any mentionable change over the entire period. The most important sources of mass poverty are to be found in this overall pattern of stagnation in the structure of the economy and per capita income, seen against a background of slow but substantial population growth in the long period. But, as we have seen, positive movements in the economy since 1947 have left mass poverty untouched. Hence, for a sufficient explanation, we have to look beyond the facts of stagnation.

Such limited growth as the Indian economy experienced in the 19th and first half of the 20th century was heavily concentrated in the agricultural sector, the development of modern industry being insignificant in per capita terms. The benefits of growth in agriculture were not only unevenly distributed, but emerged within an institutional framework which was unfavourable to the majority dependent on agriculture for a livelihood. For the most vulnerable, it was positively ruinous. To facilitate collection of revenue, and to guarantee proprietary rights, considered the surest way of improving agriculture, the colonial government introduced tenurial systems which conferred legally guaranteed proprietary right in land on about four per cent of the population directly dependent on agriculture. This new proprietary class was by and large identical with the old 'superior rights' in land who did exercise even the right of alienation wherever a land market developed. But in the pre-colonial traditional order, the hereditary usufractory right of the other agricultural classes—e g, those in the position of hereditary 'tenants' paying customarily fixed amounts—was inviolable. Now, the right to use land had to be purchased with the market controlled by some four per cent of the population earning their livelihood from land and very little guarantee for any rights below that level. Even in a situation of plentiful supply of land and shortage of manpower, this arrangement gave the proprietary class an immense advantage in bargaining. As population began to increase, without any corresponding expansion of employment outside agriculture, that advantage was steadily augmented. Remedial legislation to protect the non-proprietary classes—but never the bottom strata who had no legally recognised rights—became necessary as early as the 1850s, long before pressure of population had become a problem. Given the expenses and the complexity of the new legal system, only the more affluent and sophisticated could take advantage of these legislations which often remained no more than dead letters. Under the older system of arbitration which the new laws had replaced, no party in a dispute was entirely ruined. Now it was everything or nothing. For the poor and weak, it was often nothing. In the early stages of British Indian revenue history, the situation was further complicated by excessively heavy revenue demand which meant either abandonment of cultivation as in the Madras Presidency or the burden being passed on as far as practicable to the rent-payer.

### EMERGENCE OF MASS POVERTY

Besides, the British with their superior efficiency of organisation, completed within a remarkably short time, a process which had been unfolding itself at a slow pace under the Mughals—the collection of revenue in cash. Every agricultural producer was now under pressure to sell a share of the produce at least equivalent to the revenue demanded. The marketing organisation and credit facilities did not expand at any correspondingly fast rate. The agricultural producer hence experienced conditions extremely unfavourable to him; a dependence on near-monopsonistic buyers of his produce and near-monopolistic suppliers of credit under usurious conditions, poor returns for one's harvest, high rents and insecurity of tenure became the usual experience of the mass of agricultural producers. The legal system with its awesome respect for the holiness of contracts, provided more power to the elbow of the canny and resourceful merchant-moneylenders. As an end result, the small-holders, both tenants and proprietors, were deprived of nearly all their surplus, if not actually reduced to landlessness. The army of the landless, already in existence, if on a relatively small scale, through the economic dislocation of earlier times, found new recruits among the bottom strata of the agrarian society, especially the agrestic slaves and serfs of the South who now had to earn their livelihood by selling their labour. The increasing pressure on land through increase in population meant that they had to sell it under highly unfavourable conditions, rendered all the more grim by the social hierarchy of rural India which rendered any resistance to the privileged virtually impossible. Rural poverty on a massive scale, affecting the marginal holder of land as well as the landless, was an established fact of Indian life already by the 1860s. The recurrent famines of that decade and the 1890s, which augmented through high prices the resources of traders and moneylenders reinforced this pattern of misery.

Disparities in wealth and income, partly linked to the traditional hierarchy of rights in land, were no doubt always a feature of India's agrarian society. Not only the new institutional arrangements, but even the positive developments in agriculture, augmented that disparity, often directly at the cost of the weaker sections. Development of a market for cash crops and investment in irrigation were the two main levers of growth in agriculture. The former implied a change in the ratio of non-food crops to food crops until, with increases in population, the output of foodgrains per head of population declined sharply. The decline was especially marked in rice and the inferior cereals like jowar and barja which constituted the chief diet of the poor. As already stated, not only output, but availability also declined. Even in normal times, the marginal holders of land ceased to produce enough to meet their subsistence requirements. And given the unfavourable conditions in the market for thier labour, they had no purchasing power to make up for that short fall. The landless were, almost certainly, even worse off. All available levers of social power were manipulated to fossilise this pattern of relationship which placed the affluent producer of or dealer in cash crops in a position of advantage through the abundant supply of cheap labour and the share-cropper's meek acceptance of harsh terms. Where irrigation provided the means for increasing productivity, those in control of large holdings, especially if they were proprietors, tried and increased their holdings, often at the cost of the poorer agriculturist who was in any case hesitant to forego the production of subsistence crops to take up the riskier venture of cultivating non-foodgrains. The foreclosure of grazing lands and extension of the arable into forest areas in response to the new incentives deprived the poorer agriculturist of crucially important resources. If this was the situation now in normal times, upheavals like the famines and the crisis of '29 displaced large groups from their marginal means of livelihood, depressing wages and creating a steady flow of slum dwellers into the urban areas. After the crisis of 1929, the number of slum dwellers in Madras, to give one example, increased to account for one-third of the city's population. The small and stagnant secondary and tertiary sectors provided no stable means of livelihood for this growing army. Rural poverty had spilled over into urban areas. The all too familiar phenomenon of today's mass poverty was an established fact of life by the time population began to increase at a steady pace. Given the pyramidal structure of rural society, there was a concentration of the increasing numbers in the lower rungs, until the very poor accounted for a half or more of the rural population.

## IPCL Denies Shortage of LDPE

INDIAN Petrochemicals Corporation Limited (IPCL), a public sector company, has affirmed that there is no shortage of LDPE in the market. IPCL released 25 per cent more material in the first 11 months of 1984-85 over the corresponding period of the previous year. As against the total supply of 115,000 tonnes during 1983-84, it was expected that there would be a total supply of over 130,000 tonnes by the three producers during 1984-85. The most optimistic demand estimate for 1984-85 was of 139,000 tonnes which would leave only a small gap between demand and supply. During the quarter January/March 1985, there was to be a total supply of nearly 40,000 tonnes which was more than the average requirement of the market. Due care was taken by IPCL to ensure supplies of sufficient quantities of LDPE as per the monthly allocation during March and April this year.

All this has become possible since there was an opening inventory of over 12,000 tonnes and IPCL's production during 1984-85 was expected to be over 100 per cent of rated capacity. In order to supplement the local availability of LDPE and with a view to sustaining the growth in some key sectors, IPCL also imported 20,000 tonnes of LDPE. To further augment the supplies, IPCL has also applied for import licence for additional 10,000 tonnes. The full demand of priority sectors such as agriculture, milk/milk product packaging, fertiliser packaging, foodgrain storage, nursery sectors, etc, has been satisfied. The requirement of nearly 6,000 customers was met in 1984-85 by allocating the higher of the offtakes by the customers during 1982-83 and 1983-84. Even new customers were supplied small quantities of the product from time to time.

The price of IPCL polymer products is the same at all stock points throughout the country. This was done mainly to help small customers to draw their requirement conveniently at a uniform price throughout the country. Of the 6,000 processors, 72 per cent buy less than one tonne a month and another 23 per cent buy less than five tonnes a month. The market is thus predominantly in the small scale sector. IPCL's distribution policy is designed to serve the interests of this sector which is spread over all parts of the country.

# Superpower Co-operation and Transit Passage through Straits

**Shekhar Ghosh**

*When their interests converge, the United States and the Soviet Union have not hesitated to act in unison, even against the sentiments of their respective alliance partners, in order to devise instruments intended to protect their common interests.*

*One recent instance of superpower collaboration can be found in their common and forceful insistence, during the Third UN Conference on the Law of the Sea, on an overly liberal regime of passage through straits used for international navigation. They have substantially succeeded in incorporating in the United Nations Convention on the Law of the Sea provisions as to passage through straits which are regarded as being conducive to their security interests.*

## PATTERN OF CO-OPERATION

DESPITE their regular rhetoric and not so irregular mutual vituperations the two Superpowers—the United States and the Soviet Union—have shown considerable inclination to co-operate with each other on a number of issues. When their interests converge, they have not hesitated to act in unison, even as against the sentiments of their respective alliance partners, in order to devise instruments intended to protect their common interests. This does not, however, mean that the Superpowers have not been supported by some of their respective allies in respect to some of their diplomatic joint ventures. Anyway, one recent instance of Superpower collaboration can be found in their common and forceful insistence, during the Third UN Conference on the Law of the Sea (UNCLOS III),[1] on an overly liberal regime of passage—the so-called "Transit Passage"—through "straits used for international navigation". And they have succeeded considerably in incorporating, in the United Nations Convention on the Law of the Sea,[2] provisions as to passage through straits which are deemed to be conducive, inter alia, to their security interests.[3] (Here it can be indicated in parenthesis that a "strait" is a narrow passage connecting two open seas and "transit passage" is a system of unimpeded passage through and under straits or flights over striats for ships, submarines and aircraft of all descriptions for the purpose of continuous and expeditious transit).

The United Nations Convention on the Law of the Sea was opened for signature at Montegu Bay, Jamaica, on December 10, 1982. On the opening day 119 states[4] signed the Convention, but more than 40 states, including the USA, the UK, Japan,[5] Federal Republic of Germany, Italy, Belgium, Argentina, Israel, Turkey, Equador, Peru, Bolivia, Libya, Zaire etc have not signed it. At Montegu Bay, however, 23 states, including the USA, the UK, Italy, Israel, Republic of Korea, Jordan, Libya, Venezuela, Zaire have signed only the Final Act[6] of the Conference. For the present purpose it suffices to say that the USA has not signed the Convention for her dissatisfaction with the Convention provisions regarding exploration and exploitation of polymetallic nodules of the international sea-bed area beyond the limits of national jurisdiction because the legal-institutional constraints, as enunciated in the Convention, are not acceptable to her.[7] This, however, does not alter the fact of US-Soviet collaboration on the straits regime, nor does it mean that US refusal to be a party to the Convention would ultimately place her in any separate category as to the question of availability of facilities on the basis of the regime of transit passage through straits.[8] Agreement on the straits issue was reached long before the USA expressed her categorical reservation on the sea-bed question. Compromise on the straits issue was reached before 1977 (Ghosh, 1980, pp 234-5).

The contention of the present article is that such co-operation of the Superpowers is not accidental. Three instances of such co-operation, which seem to reveal a pattern, may be very briefly recalled here.

### (A) *Partial Test-ban Treaty, 1963*

In 1963 the USA, the USSR and the UK became party to this treaty by which only underground nuclear tests were allowed (Everyone's United Nations, 1979, p 42). The Superpowers had obvious interests in such a treaty. The USSR resented China's independent nuclear programme. And the USA had every reason to endorse this Russian resentment. Again, the USA could not reconcile with de Gaulle's plan of nuclear proliferation. Main justificaforce. The Soviet Union also had every reason to share this American concern. Thus, with this common axe to grind, the Superpowers, by this treaty, contrived to make China and France appear in the black. For, these two countries, beginners as they were in nuclear programmes, would find it immensely difficult to forego open air tests. After all, underground tests were technologically more difficult and economically more costly (Young, 1972, pp 85-6). The 1963 treaty did not, however, hamstrung the nuclear programmes of the Superpowers themselves.[9]

### (B) *Nuclear Non-Proliferation Treaty (NPT) 1968*

With global nuclear destruction becoming a possibility by mid-1960s, the Superpowers indicated their desire to do everything to contain the nuclear evil (Everyone's United Nations, 1979, p 29). President Johnson declared in 1966, "Our common task is this: to search for every possible area of co-operation . . . the Vietnam conflict does not have to stop us . . ." (Young, 1972, pp 95-6). One area of such co-operation was, at the time, prevention of nuclear proliferation. Main justification for this was the argument that, larger the number of nuclear powers, more the likelihood of nuclear war. Anyway, the Superpower co-operation in this area resulted in submission, before the Eighteen Nation Disarmament Committee (ENDC) in August, 1967, of separate yet identical draft proposals seeking to ban proliferation of nuclear weapons. These were subsequently revised in January and March, 1968. On the latter occasion there was a single joint draft. This ultimately led to the adoption, in July 1968, of the NPT. Under Article 1 of this treaty, nuclear powers party to it undertook not to help or assist, in any way whatsoever, a non-nuclear state to procure or have nuclear weapons. Under Article 2 non-nuclear powers signatories to this treaty undertook not to procure or have nuclear weapons in any way whatsoever. By seeking to disarm the unarmed, the NPT, in fact, aims at keeping the monopoly of the nuclear-haves intact.

### (C) *Sea-Bed Treaty, 1971*

Under the Sea-Bed Treaty parties have pledged not to emplant or emplace on the sea-bed, ocean floor or subsoil beyond 12 miles from their shore baselines[10] any nuclear weapons or any other types of weapons of mass destruction or any structures, launching installations or facilities for storing, testing, or using such weapons. Sensing devices for tracking submarines or surface ships have not, however, been ruled out by the treaty (Everyone's United Nations, 1979, pp 43-4). It has merely "narrowed down" (Barry, Jr, 1980, p 583) the area available for nuclear or other weapons of mass destruction. But more important than its stipulations is how this treaty was negotiated. On this point an American commentator says that it is a "prime example of what we might call ... Superpower symbiosis ..." (Barry, Jr, 1980, p 573). In fact, in the negotiation process the Superpowers had to put up a "united front" against other states including members from both the NATO and the Warsaw Pact (Barry, Jr, 1980, p 579). By early 1970s technology made huge self-propelled crawlers carrying large missiles and crawling along the ocean floor possible. But it is also true, as one scientist has calculated, that the cost of a complete underwater defence system would make the space programme budget "miniscule by comparison" (Barry, Jr, 1980, p 576). Then, Superpower interest dictated that they desist from an immensely costly programme. In addition to economic relief, this would earn them enormous propaganda value.[11] However, the Superpowers were also interested in keeping verification process confined to themselves, that is, they were against internationalising prospective verification process.[12] It was mainly on this issue that the Superpowers were accused of "collusion" (Barry, Jr, 1980, p 579). Consequently, a situation developed in which the "two giants", in order to defend the draft treaty, had to stand "almost alone against their many detractors" (Barry, Jr, 1980, p 579). Here it may be noted that the Superpower understanding on the Sea-Bed Treaty took place when the Vietnam war was at its zenith and that the ideological demarche did not prevent them, during this period and after, from strengthening their mutual co-operation in a host of other fields, especially economic.[13]

### REGIME OF STRAITS TILL UNCLOS-III

Now on to the issue of straits. Erik Bruel, an authority on the subject, defines a strait as a "contraction of the sea between two territories, being of a certain limited width and connecting two seas otherwise separated at least in that particular place by territories in question" (Bruel, 1947, p 19). While offering his definition, Bruel traces the origin of the term "strait" to "street" which conveys the ideas of "passage", "narrowness" and of "separation" (Bruel, 1947, pp 16-7). According to Bruel, the geographical elements of straits indicate their functions—those of connecting two seas and of providing passage from one sea to another and for this reason straits are crossroads of sea commerce (Bruel, 1947, pp 20 and 30). He also holds that straits, because of their strategic and political importance, have drawn, from "earliest historical times", "conquerors and politicians like a magnet" (Bruel, 1947, p 30). Importance of a strait depends, apart from its strategic location, upon the potential or actual traffic through it. Certain straits are "international" simply for the reason that interest attached to their use is worldwide. Such straits are limited in number and that extraordinary conservatism has been shown by shipping in maintaining them as routes (Bruel, 1947, p 43). Out of nearly 62 straits[14] used for international trade, the "straits of Bosphorus-Dardanelles, Dover, Florida, Gibralter, Hormuz, Lombok, Luzon, Malacca-Singapore, Mazambique, Skagerrak, Bud-el-Mandeb are considered to be the most important" (Rao, 1975, p 116). It is important to note that with the exception of Florida, all these straits are overlapped by 12-mile territorial seas.

As to the question of passage through straits a distinction used to be made, both in theory and practice, between merchant vessels and warships. As to the former, Bruel writes that "... ordinary rules about "passage inoffensif" in territorial waters, taken in widest sense of covering also that part thereof that falls in international straits, were sufficient to guarantee the right of passage for merchant vessels in such straits in time of peace ..." (Bruel, 1947, p 106). McDougal and Burke also hold that "there has been a clearly discernible trend for the past hundred years towards greater and greater freedom of access" (McDougal and Burke, 1962, pp 196-7). Briefly, after the First World War "the right of passage of merchant vessels in international straits was certain" (Baxter, 1964, pp 162-3). But the same was not true for the passage of warships. This was recognised with regard to the Turkish straits in the Conventions of 1841, 1856 and 1871 (Bruel, 1947, p 106) and conditional right was accorded only by the Treaty of Lausanne (1923) and finally by the Montreaux Convention of 1936 (Vali, 1972, pp 29-57). Likewise, no foreign warships could pass through the Danish straits without the King's permission "even in time of peace" and the 1857 treaty concerning them did not change the situation.[15] (The UN Convention on the Law of the Sea, by Article 35(c) of it, exempts, from its purview those straits—such as, the Turkish and the Danish ones —in which passage is regulated in whole or in part by long-standing international conventions ...) Distinction between merchant vessels and warships in respect to passage is made because the latter threaten.[16] However, in time of peace, concerned coastal states used to permit, without recognising any right proper, passage of foreign warships through their territorial seas of straits falling, wholly or partly, within them (Bruel, 1947, p 230).

With the failure of the 1930 Hague Conference to adopt any Convention on the territorial sea (Ghosh 1980, pp 221 and 232), the decision of the International Court of Justice (ICJ) in the Corfu Channel Case (1949) became the first authentic opinion on the law of passage through straits. Moreover, this decision assumed extraordinary importance because the International Law Commission (ILC), which was assigned the preparatory work for the First UN Conference on the Law of the Sea held in Geneva in 1958, practically copied this judgment while formulating relevant provisions for straits (Ghosh, 1980, p 232). In this case between the UK and Albania, the ICJ upheld the British contention to send warships through the Corfu Channel (a strait between the Greek island of Corfu and Albania). The Court held: "... states in time of peace have a right to send their warships through straits used for international navigation ... without previous authorisation of a coastal state, provided the passage is innocent. Unless otherwise prescribed in an international convention, there is no right for a coastal state to prohibit such passage through straits in time of peace" (ICJ Reports, 1949, p 28). Article 16(4) of the 1958 Convention on the Territorial Sea and the Contiguous Zone (UN Doc A/CONF 13/L 52) substantially endorsed the Corfu decision and provided for non-suspendable innocent passage through straits.

### SUPERPOWER INTERESTS IN STRAITS

Apart from the trading interests[17] which the Superpowers share with other states, they have obvious military interests in a comparatively unbridled regime of passage through, under and over straits. And they have not hesitated to state them in clearly military terms. As the issue of naval mobility through straits has been interpreted by the Superpowers unequivocally in national security terms, it has assumed, during UNCLOS-III, critical importance, at least in bargaining sense. The USA has an astonishingly large navy, symbolising incredibly enormous striking power. The Soviet navy is also as large, if not larger (Shulman, 1968, pp 138-61;

Mangone, 1981, p 71). US military security interests are interpreted, inter alia, in terms of her "ability to maintain an ade quate capacity to project American forces overseas in local wars"; to "protect US citizens, commerce and access to vital resources in peace time"; and to "protect the sea-lanes, project forces abroad, maintain combat capabilities and perform other naval functions in a more than local war" (Osgood, 1976, p 11). To the Americans the Korean War demonstrated that naval forces (enjoying requisite mobility, of course) were vital to the "maintenance of supply lines, the landing of infantry . . . positioning of air attacks" (Mangone, 1981, pp 69-70). O'Connell holds that for the US and the Soviet navies "maintenance of the law in a form that will not make operational deployment between the Indian Ocean and the Pacific Ocean unacceptably difficult is essential both to maintenance of equilibrium between themselves and in order to permit intervention locally . . ." (O'Connell, 1975, p 101). And in this equilibrium of forces, the role of missile-carrying nuclear submarines has been deemed to be critical. In a sense, these submarines are the most important component of the so-called deterrent forces of the Superpowers. Land-based missiles or bombers are easily detectable and hence vulnerable. But the nuclear submarines can lurke for long periods in the opaque depths of the oceans. Hence it is not easy to detect and destroy them. At the same time, they are ready to destroy, at a moment's notice, the major targets in the enemy country. Naturally, missile-carrying nuclear submarines are strategic weapons of "extraordinary worth" (Mangone, 1981, pp 70-2).

It is then obvious that the question of naval mobility—including submerged passage of nuclear submarines through straits—should rate very high in the thinking of the Superpowers. As far as the USA is concerned, this is reflected in the "special weight" which the Department of Defence enjoyed within the US delegation to UNCLOS-III (Darman, 1978, pp 375-6). In respect to naval mobility through straits the Soviet Union is perhaps at a comparative disadvantage. One analyst even argues that a restrictive regime for straits would harm the Soviets more than the USA (Darman, 1978, p 393). Thus, it is found that the USSR reacted very strongly when, in late 1971, Indonesia and Malayasia undertook a move to "deinternationalise" the Malacca Straits (Leifer and Nelson, 1973, pp 190-7). This reaction is explained by geography. Afterall, the Malacca-Singapore Straits are the normal routes for Soviet vessels from the port of Vladivostok to the Indian Ocean. Likewise, geographical reasons have determined Soviet (and earlier Czarist) attitude towards the Turkish straits for a long time (Vali, 1972, pp 3-57), for they constitute the only route from the Black Sea to the Mediterranean. The Baltic Approaches are also crucial for Soviet naval movements from the Baltic to the North Sea.

Against the backdrop of all this, let us recount the grounds of dissatisfaction with the 1958 Geneva Convention provisions, inter alia, on straits. First, coastal states had wide scope to determine, subjectively, "innocence" or otherwise of passage (Ghosh, 1980, p 225). Secondly, the controversy as to whether foreign warships had also the right to innocent passage (without prior authorisation of or notification to coastal states) through straits falling, wholly or partly, within territorial sea persisted as a part of the general controversy as to such right in the territorial sea (Ghosh, 1980, pp 226-7; O'Connell, 1975, pp 99-100). Last but not the least, Article 16(4) of the 1958 Convention did not permit submerged passage of submarines and overflight of aircraft.[18] After the failure of the Second UN Conference on the Law of the Sea convened in 1960 to determine, primarily, the width of the territorial sea, a very large number of states adopted, during 1960s, the 12-limit for the territorial sea (Ghosh, 1980, pp 220-2). As a result 120 or so straits were "affected" in the sense that they formed, wholly or partly, territorial seas of the bordering states. Of these, 16 straits are of crucial strategic significance to the Superpowers and they include Berring Strait (West), Western Chosen, Malacca, Sunda, Selat, Lombok, Ombai, Old Bahamas Channel, Hormuz, Bab-el-Mandeb, Gibralter, Dover, Dominica, Martinique, Sant Lucia Channel, etc (Rao, 1975, p 179; Osgood, 1976, pp 14-6). Naturally, the Superpowers could not remain calm (O'Cornell, 1973, p 418). In 1967 they showed considerable eagerness in a "mini" conference in which the question of the "freedom of transit across international waterways or straits" was to enjoy top priority and they began consultations "in the earnest" which led them to circulate, "each on its own", a draft treaty of three articles first to their "closest allies" and then to "most" of the UN members (de Soto, 1973, p 127; Charney, 1977, p 598). However, this initiative could not move far, because Malta's proposal of August 18, 1967 ultimately acted as the real catalyst for UNCLOS-III. Anyway, during UNCLOS-III the issue of straits figured rather prominently from the days of the Sea-Bed Committee and the Superpowers took keen interest in it right from the outset.

## Superpower Role during UNCLOS-III and Transit Passage

To offset the difficulties that might be created by the demand of a large number of states bordering straits (straits states) for a regime of innocent passage (suspendable or non-suspendable) for straits,[19] the USA submitted a proposal (UN Doc A/CONF 138/SC II/L 40) before Sub-Committee II of the Sea-Bed Committee on August 3, 1971. Article 2 of it dealt with the concept of so-called "Free Transit". It read: "In straits all ships and aircraft in transit shall enjoy the same freedom of navigation and overflight, for the purpose of transit through and over straits, as they have on the high seas . . ."

In 1972, President Nixon held: "Our security and that of our friends depends . . . on free movement through and over international straits. A significant portion of our strategic deterrent is sea borne" (Shyam, 1975, p 32). While speaking in favour of "free transit", Stevenson, the US delegate, stated that the USA could not afford to "subject her sea communication or defence preparedness to the consent or political goodwill of another state" (Shyam, 1975, p 28).

The Soviet Union also submitted a proposal,[20] toeing the US line, before Sub-Committee II of the Sea-Bed Committee on July 25, 1972. The Soviet delegate, Kolesnik, contended that the USSR also believed, like the USA, that "rules of free passage through straits" had become an "inherent attribute" of the freedom of the high seas, since it was obvious that without unhampered passage through straits, freedom of the high seas would be a "mere fiction". He further argued that the concept of innocent passage had never been and could never be applied to such straits as the Gibralter, Dover, Malacca, Bab-el-Mandeb, etc Finally, he, like Stevenson, refused to agree to a situation in which the principle of freedom of passage would be the object of subjective interpretation of coastal states and in which there would be "the domination of only 12 to 15 states over the passage of vessels . . ." (Anand, 1974, pp 183-4). For Kolosovsky, another Soviet delegate, "there could be no real freedom of international navigation . . . without free transit" (Third UNCLOS, Official Records, Vol 1, p 68).

However, the expression "free transit" was ultimately replaced by that of "transit passage" as it was enunciated in the British proposal[21] submitted during the Caracas session of UNCLOS-III in 1974. Article 1, Chapter III of it advocated "transit passage" for all ships and aircraft "solely" for the purpose of "continuous" and "expeditious" transit of straits. It should be noted in passing that India also supported the tenor of transit passage through straits (Third UNCLOS, Official Records, Vol 1, p 96). Japan, given her obvious trading interests, was also a strong supporter of freedom of navigation through straits (Leiffer and Nelson, 1973, p 193).

Ultimately the concept of "transit passage" found acceptance on the basis of a package deal (Ghosh, 1980, pp 233-4)—the 12 mile territorial sea plus the 200-mile Exclusive Economic Zone (dealt with in Part V of the Convention) on the one hand and the right of transit passage through straits on the other, being the main components of the so-called package. In fact, the USA[22] and the USSR[23] especially, made it a bargaining point that acceptance of 12-mile territorial sea and 200-mile Economic Zone depended upon acceptance of "transit passage" through straits. Anyway, the upshot is Part III (Articles 34-45) of the UN Convention on the Law of the Sea. Article 38(1) provides that in straits (defined in Article 37) "all ships and aircraft enjoy the right of transit passage, which shall not be impeded . . ." According to Article 38(2), "Transit passage means the exercise . . . of the freedom of navigation and overflight solely for the purpose of continuous and expeditious transit . . ." Article 39 lists the 'dos' and 'don'ts' for ships and aircraft "during transit passage" while Article 41 authorises states bordering straits to designate and prescribe "sea-lanes" and "traffic separation" schemes for safety of navigation. Article 42 empowers states bordering straits to make laws and regulations for safety of navigation, prevention of pollution, prevention of violation of their customs, fiscal, immigration and sanitary regulations, and so on. Article 44 provides that states bordering straits "shall not hamper transit passage" and that there "shall be no suspension of transit passage".

Commenting on "free transit" the predecessor of "transit passage" and the essentials of which are embodied in the successor, one analyst says that it is an "entirely new concept" which is "the first attempt to extend, rather than merely resist encroachment upon, the right of navigation" (Warbrick, 1973, pp 145-6). Vigorous corroboration of this comes from another commentator: "Free transit . . . is an entirely new concept. It would apparently permit complete freedom of passage of warships, including nuclear—armed submarines, on the surface or submerged, without notification or irrespective of mission. It would permit freedom of civilian and military flight through the superjacent airspace. Finally, it would deprive the Coastal State of the power to categorise certain passages . . . as non-innocent" (Brown, 1972, p 26).

## Notes

1 Following a proposal of Ambassador Pardo of Malta at the UN on August 18, 1967 before the UN General Assembly, the item concerning "the Peaceful Uses of the Sea-Bed Beyond the National Jurisdiction" was first included in the agenda of the Assembly in 1967. This led to Resolution 2340 (XXII) on December 18, 1967, establishing the Ad Hoc Committee to study "the peaceful uses of sea-bed and ocean floor beyond the limits of national jurisdiction". Consequent upon its Report, the General Assembly, by Resolution 2469 (XXIII) of December 21, 1968, established the Committee on the Peaceful Uses of the Sea-Bed and Ocean Floor beyond the Limits of National Jurisdiction (Sea-Bed Committee). On December 17, 1970, the General Assembly adopted Resolution 2750 (XXV), under Part C of which it decided to convene a new Conference on the Law of the Sea in 1973 and instructed the Sea-Bed Committee to undertake preparatory work. The Conference was to deal with the establishment of an equitable international regime for sea-bed area beyond the limits of national jurisdiction and a broad range of related issues such as the High Seas, Continental Self, Territorial Sea (including the question of its breadth and that of straits), Contiguous Zone, fishing and other resources, preservation of marine environment and hydrographical research. Under Resolution 3067 (XXVIII) of November 16, 1973 the General Assembly convened the first session in New York in December, 1973, to deal with organisational and other matters within the scope of paragraph 3 of the Resolution. As per this paragraph the Conference was to adopt a "convention dealing with all matters relating to the law of the sea . . . bearing in mind that the problems of ocean space are closely interrelated and need to be considered as a whole." Thus began a marathon conference which finally ended in 1982.

2 UN Document No A/CONF/62/122. The Draft Convention was adopted in New York on April 30, 1982 through a verbal vote. 130 States voted in favour, four against (the USA, Israel, Turkey and Venezuela) and 17 States (which included some Western European States) abstained from voting. Another 17 States were not represented (Jenisch, 1983, p 172).

3 However, one American commentator argues that provisions regarding navigation through straits are not adequate to safeguard US security interests (Reisman, 1980, pp 67-76).

4 117 States, the UN Council of Namibia and Cook Islands (Jagota, 1983, p 338).

5 Japan and Antigua and Barbuda signed in February, 1983.

6 Not legally binding, the Final Act is a summary of the 14-year history of the Convention-in-the-making.

7 See, for instance, the 'Statement by the President of the United States of America on the United Nations Law of the Sea Convention' (Reprinted in IJIL, Vol 23, 1983, at pp 143-4).

8 With the passage of time, transit passage is likely to enjoy the status of customary law. Alternatively, the USA, by adhering to 3-mile territorial sea, may argue that the major straits have high seas corridor where navigation rights are practically unbridled.

9 While commending the 1963 treaty to the US Senate, the Kennedy Administration indicated this clearly (Young, 1972, p 87).

10 12-mile limit is now the accepted breadth for the Territorial Sea over which coastal states have sovereignty subject to innocent passage by foreign ships (Ghosh, 1980, pp 216-8).

11 On July 16, 1968 the Soviet Premier submitted to the ENDC a 9-point disarmament proposal the last point of which related to banning of military installations on the seabed. On the same day the US President also spoke, before the ENDC, of the need for an agreement prohibiting the use of sea-bed for the "emplacement of weapons of mass destruction" (Everyone's United Nations, 1979, p 43).

12 Verification under UN auspices might lead to embarrassing disclosures. Moreover, the USA would have to foot the major share of the bill for UN verification (Barry Jr, 1980, p 580).

13 See, for a survey of the factors compelling such co-operation, Ghosh (1973, pp 3-7) and also Brown (1974, pp 67-78).

14 For a relevant description of the major straits of the world see Kennedy, Commander R H, 'A brief geographical and hydrographical study of straits which constitute routes for international traffic' (UN DOC A/CONF 13/6 and Add 1).

15 However, Danish practice changed in the early 20th century under German pressure and in 1913 Denmark granted to foreign warships the right, in time of peace only, to pass through the Danish straits without previous notice (Bruel, 1947, p 107).

16 Elihu Root's opinion in the North Atlantic Coast Fisheries Case (McDougal and Burke, 1962, p 206).

17 Role of the seas in international trade is enormous. In this, judicious use of the straits is a must. For, unnecessary detours, given the contemporary pattern of shipping, would be prohibitively costly. At the same

time, coastal states require to regulate movement of today's huge ships (tankers and bulk-carriers, many of which are nuclear-powered, or carry dangerous materials) along their coasts. As there have been several occasions of huge oil spills from tankers, coastal states' concern for safety is understandable (Ghosh, 1980, pp 217-8 and 229-30).

18 This reason was categorically stated by the US delegates for their refusal to accept any regime of innocent passage for straits (Stevenson and Oxman, 1974, p 10).

19 Cyprus, Greece, Malayasia, Morocco, Philippines and Spain submitted a proposal during UNCLOS-III favouring innocent passage through straits overlapped by 12-mile territorial sea. There were also other proposals to this effect submitted by these and other states. (Ghosh, 1980, p 232).

20 UN DOC A/CONF 138/SC II/L 7/Add 1. There were also other Soviet bloc proposals in the same vein, such as, that of Bulgaria *et al* (UN DOC A/CONF 138/SC II/L 11). Polish proposal (UN DOC A/CONF 138/SC II/L 49).

21 UN DOC A/CONF 62/C 2/L 3 Canada also submitted a proposal supporting freedom of navigation through straits (UN DOC A/CONF 62/C 2/L 83) as did Italy (UN DOC A/CONF 138/SC II/L 30 and Corr 1).

22 See Statement of Stevenson of the USA in Third UNCLOS, Official Records, Vol 1, p 160.

23 The USSR, a traditional supporter of 12-mile territorial sea, used 200-mile Exclusive Economic Zone as the bargaining lever (Anand, 1974, p 188)

APPOINTMENTS

**Govind Ballabh Pant Social Science Institute, Allahabad**
80, Tagore Town, Allahabad.

**ADVERTISEMENT No. 1/1985**

**Wanted**

1. Readers one each in Economic Sociology, and Political Sociology and one Research Associate in Political Sociology.

For above three posts the qualifications and pay-scale as approved by the U. G. C.

2. One Research Assistant in Statistics: Pay-scale Rs. 550-25-750-EB-30-900.

**Qualifications:** M. A. in Statistics or Economics with Statistics. Applications must be submitted on the prescribed form obtainable on payment of Rs. 5/- only by cash or money order (not postal order) and Rs. 4/- extra in case required by registered post. The last date for receiving applications for all the posts is 21.5.1985.

# Justification for Imperialist-Financed Activities

### Prakash Karat

HARSH SETHI in his injured response to the article on 'Action Groups/Voluntary Organisation' in the *The Marxist*, fails to counter the central issue posed by us. The article had highlighted the CPI(M) understanding of the strategic design of imperialism in sponsoring and encouraging many such groups. It documented the crore of rupees flowing in from official, semi-official and private agencies in the West to finance thousands of organisations in India. The Government of India permits this flow virtually unrestricted to these private bodies. Such funds are used by many organisations for *political* purposes with the full knowledge and encouragement of the sponsoring agencies; to put forward a political platform, organise different sections of the people for *political intervention*. The source of the foreign funding may be church or secular. For Harsh Sethi there is nothing wrong *per se* in utilising such funds if it is used for worthwhile purposes. According to him, "The source may be national or foreign, funds are required and since the source of all surplus is the labour of the working people, surely there is little wrong in laying claim to that surplus. So in a sense, the argument is not funding *per se*, but the terms of the funding."

One can only be amazed at the naivete and flippancy of such an argument which has dangerous implications. Since all surplus is created by the people, there is no harm in receiving money from a CIA front or from the monopolists. As long as one is subjectively satisfied that it is being put to good use, in a manner which may be even for political activity. Sethi obviously finds nothing wrong in using such money for political work. We wonder whether the more serious of the radical action groups would also put out such a defence. As for the CPI(M), we wish to emphatically refute the implication in Harsh Sethi's argument that, "Even in the best organised and long standing trade unions or Kisan Sabhas—what to speak of political parties—funds have to be generated from outside the class and this does create dependencies." This is definitely true of the action groups whose outlook Sethi defends. As far as the CPI(M) is concerned it has faced such charges from more motivated quarters and effectively rebutted them as anti-communist slander.

Sethi in his anxiety to defend the voluntary organisations takes the easy way out by implying that 'they are doing what you are doing'. The fundamental basis for building up mass organisations of the working people and the party stems from the unity and consciousness of the people concerned. The higher the level of organisation and consciousness the greater the financial resources mobilised from the working people. Sethi has only to go through the columns of last year's *People's Democracy* to understand how the party raises funds for its activities such as building its party headquarters. The only funding which any mass organisation led by the CPI(M) will receive from 'outside', and this would be only a small fraction of its regular funds, is from its fraternal class and mass organisations within the country. To give a recent instance, the Tamil Nadu State CITU raised from the workers through its affiliated unions, a sum of Rs 40,000 to assist the agricultural labour and peasant movement in the state. It is here precisely that we disagree and oppose Sethi's dangerous justification that funding from outside for oppressed classes is essential and therefore the inevitability of 'dependencies' being created.

The CPI(M) as a matter of principle would oppose any organisation resorting to *political* activity in the country financed by Western agencies. To justify this by quoting Oxfam aid to Kampuchean refugees, or humanitarian aid to countries in the thick of national liberation struggles which have suffered war damage is merely trying to divert from the gravity of the danger. Neither can Harsh Sethi hope to justify foreign funding to political organisations and erode the CPI(M) stand by referring to governmental (including the Left Front government) agreements with imperialist agencies or governments. Surely, Sethi should know the vital difference between an elected government entering into economic and diplomatic agreements for aid and collaboration within the framework of an overall economic policy subject to legislative sanction and public scrutiny and that of direct funding by imperialist agencies to private organisations in India with freedom to indulge in political activities. That is why the CPI(M) has demanded that the Foreign Contributions (Regulations) Act should be so amended that prior governmental permission would be required for such funding to action groups/voluntary organisations. Till the menace of imperialist penetration can be eliminated once and for all, it would be better that an elected government, whatever its class character, be enabled to check such funds under public scrutiny.

It looks like Harsh Sethi wants the CPI(M) to give up its basic task as a Marxist-Leninist party to combat all ideologies alien to it whether foreign inspired or indigenous. How else can one interpret the whole tenor of Sethi's rejoinder which laments our inability to conduct a debate without "high levels of acrimony and accusations on both sides". We would have thought this but natural in any ideological debate and Sethi seems to be confusing polemics with use of force and abuse. On our part, as already stated in *The Marxist* article with reference to the Christian radical groups, the CPI(M) is ready to respect and co-operate with any democratic force in the Christian fold, notwithstanding ideological differences, on common issues, provided the fight conducted by these forces is not sustained by imperialist/foreign funding. But to expect the CPI(M) to abjure from ideological criticism and exposure is to demand that the party abdicate its ideological moorings—something which despite all our efforts to understand Sethi's misguided yet sincere advice, we are unable to accede to.

## Scindia Steam Navigation

SCINDIA STEAM NAVIGATION COMPANY, after suffering a whopping loss in the year ended June 1984, is looking ahead to an improved performance in the current year, This expectation has been caused by some welcome increases in freight rates in various liner sectors coupled with some improvement in port conditions. As a result, the company's freight earnings during the first nine months have been higher at Rs 88 crore as against Rs 69 crore during the same period last year. This increase in freight earnings according to Sumati Morarjee, Chairman, is expected to enable the company to meet largely its direct and indirect expenses. She hopes that the results in the coming months will continue to show steady improvement. The company is keen to modernise the existing liner fleet and is also examining a diversification programme. To start with, the company intends to acquire two to four reasonably modern container-oriented and fuel-efficient liner ships of about 17,000 DWT to strengthen the container lifting capacity. These ships will be substituted for the old break-bulk ships, which were sold during the past. In addition, the company wishes to acquire two or three vegetable oil product carriers in the next six months,

## CENTRE FOR POLICY RESEARCH

*( The CPR, an autonomous Research Institution under the Indian Council of Social Science Research)* invites applications for the following posts:

### 1. RESEARCH PROFESSOR IN INDIAN POLITY (1 Post)

In the grade of Rs. 1500-60-1800-100-2000-125/2-2500. The gross starting and closing emoluments are Rs. 3,645 and Rs. 5,425/- per month respectively.

The applicants must be outstanding scholars preferably with Ph.D. Degree and research publications to his/her credit in the field of Indian Polity. The selected candidate will be expected to conduct research on macro political problems of the country. The post is on a regular basis.

### 2. FELLOW (2 Posts)

In the grade of Rs. 1200-50-1300-60-1900. The gross starting and closing emoluments are Rs. 3,195/- and Rs. 4,045/- per month respectively.

### 3. POST DOCTORAL RESEARCHERS (2 Posts)

In the grade of Rs. 850-40-1250. The gross starting and closing emoluments are Rs. 2,318.50 p. and Rs. 3,245/- per month respectively.

For 2 and 3 posts apart from the necessary academic doctoral degrees and an impressive record of research publications, specialisation in South-West and South East Asia will be a desirable qualification. The selected candidate will be required to undertake independent high grade research and studies of issues and problems relating to Regional Co-operation and Development covering the inter-linking regions of South, South West and South East Asia. Selected candidates may be accepted on deputation on the usual foreign service terms. To begin with each position will be for a period of 18 months.

### 4. STENOGRAPHERS (2 Posts)

In the grade of Rs. 475-20-675. The gross starting and closing emoluments are Rs. 1,353.30 p. and Rs. 1,846.10 p. per month respectively. The posts are on a regular basis.

Graduates with English medium at High School and College preferably below 35 years with English shorthand speed of 100 w.p.m. having stenography experience of at least five years need apply. Deserving candidates may be given a higher initial start.

The posts at 1 and 4 carry other benefits like earned leave, medical benefit, medical leave besides Provident Fund, Leave Travel Concession and Gratuity benefits as per Centre's rules from time to time.

Applications stating name, date of birth, age, educational qualification, work experience, emoluments drawn and research publications for posts at 1, 2 and 3 and general details about 4 should reach the Director, **Centre for Policy Research, Dharma Marg, Chanakyapuri, New Delhi - 110 021** within 15 days from the date of publication of this advertisement.

# Completing the Package

AT the annual general meeting of the Employers' Federation of India in Bombay last week the president of the Federation spoke of the need to amend the country's labour laws which, according to him, provide "unjustified protection" to the organised industrial working class. Coming from the Employers' Federation this demand is nothing new. What makes it noteworthy is that it is likely to evoke sympathetic echoes in the government at the highest levels. Soon after assuming office after the general election, the Prime Minister himself had told a conference on engineering exports organised by the Association of Indian Engineering Industry in March that "there are some anomalies in our labour laws which must be looked into".

This feeling, which has been expressed by government spokesmen on other occasions as well, has to be seen in the context of the government's policies to step up the rate of industrial growth. Towards this end major fiscal concessions have been extended to business and industry, industrial licensing has been further liberalised, a large number of companies and business houses have been taken out of the ambit of the MRTP Act through a quadrupling of the minimum asset limit and the import policy which is to be in force for the next three years has been so framed as to encourage particularly the import of capital goods to speed up modernisation of industries, automation and computerisation. However, the feeling has been clearly discernible in the government that the above package of measures remains incomplete in one crucial respect—in the absence of complementary changes in the area of industrial relations.

Apart from the general concern for minimising the loss of industrial production resulting from industrial strife, there is apprehension that unless militant trade unionism is firmly curbed it will interfere with the achievement of at least two specific aspects of the government's industrial policies: first, the accent on modernisation and automation and, second, the resolve to allow unprofitable or 'sick' industrial units to be closed down. Opposition from workers and trade unions to the inevitable retrenchment and unemployment is apparently seen as the principal obstacle to the pursuit of these policies and so it is considered necessary to curb the scope for expression of such opposition. It is likely that there is also another consideration which is impelling the government to prepare itself in advance to put down industrial actions by workers: the certainty of a revival of inflation in the economy which will force large sections of the working class to resort to different forms of industrial action just to prevent their real earnings from being eroded. If the government is seen to be unable to curb such actions by workers then it will lose a good measure of the goodwill of business and industry which it has been basking in, especially since the presentation of the Budget and the subsequent announcement of the import policy. This prospect must undoubtedly worry the government.

It is not so material whether or not the government comes forward immediately with new legislation to regulate industrial relations. For, despite what the Prime Minister and the president of the Employers' Federation have said, the fact is that the government already has enough legal powers to crack down on industrial actions by workers. The Industrial Disputes Act, 1947, gives ample powers to the government to intervene in disputes, refer them to adjudication if they are not settled, declare strikes 'illegal' and to prosecute and punish those resorting to 'illegal' strikes. The government can act even more summarily in these respects under the draconian Maintenance of Essential Services legislation. The long and short of it is that as things stand the government already enjoys powers to, if it wishes, declare virtually any strike 'illegal' and to proceed against the concerned workers and trade unions. So it is not really necessary for it to come up with new legislation in order to achieve its objective of curbing strikes and other forms of industrial action by workers. What is material is how the government will exercise its powers. And here the indications are unambiguous.

The government, it has been made clear, regards the maintenance of industrial peace as a vital part of its package of policies to achieve economic growth and modernisation of industry. Workers and their organisations have thus had sufficient forewarning. They have no justification for being complacent, whether the laws governing industrial relations are further tightened or not.

## *Gujarat*

### Killing Continues

THE situation in Gujarat seems to be a peculiar mixture: a kind of stalemate interspersed with frenzied bursts of killing, arson and looting. The latest such burst in Ahmedabad, on the night of May 8, resulted in at least seven deaths.

Coincidentally, earlier on that very day Chief Minister Madhavsinh Solanki had informed Congress(I) MALs, at a meeting in the capital Gandhinagar, that the anti-reservation stir was fully under control, with the necessary precautions taken to prevent any further violence. It could be argued that the absence of any overt trouble during the preceding week or so had misled Solanki into making the statement. But surely as a Chief Minister he would have been aware of the tensions brewing in the period of surface calm.

The three-month old anti-reservation agitation has grown way beyond the leadership of the upper caste students, who initiated it, to acquire a momentum of its own. The original grievance of these students no longer exists. The state government's decision to increase the number of seats reserved for backward castes in educational institutions—which had provoked the upper castes' protest—was retracted weeks ago, yet the Navrachna Samiti, consisting of representatives of upper caste students and their guardians, has not withdrawn its stir. This may be largely because of the disorganised nature of the *ad hoc* Samiti, with factions pulling it in different directions. The Chief Minister has claimed that the opposition parties are out to create trouble, after having been trounced in the Lok Sabha and Assembly polls. The BJP, Janata and Lok Dal leaders of the state are on a hunger strike, demanding normalcy in the state and dismissal of Solanki's ministry.

The government employees belonging to the upper castes have also seized upon the present vulnerability of Solanki's ministry to grab better promotional prospects at the expense of the backward castes. These employees, who constitute a majority of the staff strength, withdrew their indefinite strike after four days on May 7, only after the state government virtually scrapped the caste based promotional system it had introduced in 1981 in government and semi-government services. The Panchayat employees, dissatisfied with being left out in the agreement, are still on strike. And so, for similar reasons, are the junior doctors in the major urban centres.

This then is the backdrop against which the killings in the poorer localities of Ahmedabad took place on May 8. So far well over a hundred persons have lost their lives. And the more violent and persistent of the clashes have reportedly taken place between Hindu upper castes and Muslims. Ahmedabad does have a history of communal clashes—more than 2,000 were killed in the 1969 riots there. The RSS is known to be active in the areas where the recent communal clashes have occurred. Also there are reports of criminal gangs sparking trouble for their own ends. Yet the specific factors which have turned the caste based agitation into communal violence need further exploration.

## *Quran and Courts*

### Right Stand, Wrong Reasons

AT a time when the country is being rocked by serious sectarian violence in Gujarat and Punjab, Justice Padma Khastagir of the Calcutta High Court has in her judicial wisdom created a situation which has been causing grave consternation in government circles in both Calcutta and New Delhi. Though the precise legal implications of Justice Khastagir's action is said to be the subject of dispute between herself and the chief justice of the Calcutta High Court on the one hand and the state's advocate-general and some other lawyers on the other, the fact remains that a petition filed before Justice Khastagir by two non-descript persons demanding the banning of the Quran has not been dismissed outright by her. Although the highly explosive potential of the issue cannot be unclear to anyone, Justice Khastagir is reported to have justified her action in an interview with a newspaper reporter with the plea that "she should not turn down a petition". The newspaper concerned, however, reminds its readers that "a large number of petitions are turned down every year on grounds of irrelevance".

The Calcutta High Court has, of course, a distinctive tradition of not only entertaining all sorts of petitions but also of issuing *ex parte* injunctions based on pleas in writ petitions—a tradition which was recently the subject of a severe stricture by a Supreme Court bench. Moreover, the judicial punctilio claimed by Justice Khastagir has not always served the cause of the aggrieved: quite a few suits filed in the Calcutta High Court by private citizens as well as civil liberty organisations against police officers for alleged murders and tortures of Leftist militants and even innocent people during the period from the late Sixties to the Emergency in the mid-Seventies, were all invariably dismissed by the Calcutta High Court, no doubt in its wisdom.

Chief Minister Jyoti Basu in a statement in the recently concluded session of the state assembly called this particular petition a "totally unprecedented" and a "despicable act". The state government has made a strong plea for its dismissal and the Union government has also decided to join the plea, while the issue is already having predictable national and international repercussions. In Calcutta itself, though the tensions are still happily subdued, it is somewhat unfortunate that the majority of the enlightened members of the High Court Bar Association refused to pass a resolution moved by 70 of its members deploring the fact that the original petition was at all "entertained".

While the West Bengal government's prompt intervention in the case is laudable, the main argument, reportedly prepared by it in support of its prayer for the dismissal of the original petition is not. The Left Front government, of which the CPI(M) is the principal constituent, is reported to have taken the stand that

> the Holy Quran is a divine book and no earthly power can sit upon judgment on it and no court of law has jurisdiction to adjudicate it . . . holy books like the Quran, the Bible, the Gita and the Granth Sahib or their translations cannot be subject matters of adjudication in a court of law . . . all holy scriptures are immune from judicial scrutiny.

The ascription of divine origin to scriptures and placing them unconditionally above law, that is, enlightened public opinion, is not only alien to Marxism and even bourgeois rationalism, but also something which a political leader like Gandhi with his deep religiosity would not countenance. "My belief in Hindu scriptures", he has said, "does not require me to accept every word and every verse as divinely inspired . . . *I decline to be bound by any interpretation, however learned it may be, if it is repugnant to reason or moral sense"* (emphasis added).

If the Left Front government today concedes absolute supremacy of scriptures based on the theory of their divine origin, what would it do tomorrow when the Ananda Margis would approach the court with the demand of staging *tandava* dance on the streets with human skulls and spears claiming justification from some obscure Hindu scriputre of supposedly divine origin?

There are surely enough legal and political arguments to quash the mischievous petition.

## *Bonn Summit*

### Reagan Draws a Blank

RONALD REAGAN went to the Bonn summit with two or three clear objectives. Politically, he sought an endorsement on his stand in regard to the Strategic Defence Initiative or 'Star War' and also his aggressive stance on Nicaragua. On the economic front, he wanted an early date in 1986 for the start of the next round of trade negotiations. He failed on both the fronts and returned home empty-handed, whatever his trumpeteers might say about his European jaunt.

On Nicaragua, not only did he not get an endorsement for his policy stance but also he was roundly criticised by his colleagues at the summit for his premature actions, including the most recent imposition of a trade embargo. Even Margaret Thatcher was not sufficiently supportive.

On Star Wars, the stance taken by the Europeans and Japan was vague. The Europeans are particularly worried on several scores. Firstly, it bothers them that the strong US stance in this regard might make it impossible to reach any accommodation with the Soviet Union on the existing weapons systems. Secondly, they are concerned that should the USA develop a space base or defence system, it might tend to rely less on land-based defences and this might make Europeans more vulnerable. Thirdly, there is the fear that they might be left out of the technological spin-off from the development of the new system of defence. Of course, on this last point the US was willing to share with its partners some, though unspecified, part of the work involved. Was it this offer that muted much of the criticism? Or was it for some other reasons? The fact still remains that Reagan's other colleagues did not consider it politic to be overtly critical, though he failed to secure a ringing endorsement.

It was, however, on the issue of trade negotiations that Reagan fared the worst. Francois Mitterand of France was simply unbending on this subject. No date could be set for trade negotiations unless it was agreed to start deliberations on monetary reform. The US offer to host a conference of developed countries on monetary reform was rejected by him. He clearly saw it as a ruse for doing nothing in the matter. Instead, Mitterand asked for a monetary conference in 1986 with the Third World participating. Of course, Mitterand is also worried that the US pressure for trade negotiations was directed at the agricultural price support policy of the Common Market and therefore demanded an assurance that trade talks would not cover the Common Market's agricultural policy. Although, in the final stages Mitterand was deserted by the other European summiteers, he did not give in to the pressures. This is being widely explained, particularly in the US press, in terms of Mitterand's political problems at home, forgetting that the domestic wicket on which Ronald Reagan has currently been batting is not particularly strong. He is under attack in his own Congress on both Nicaragua and the budget deficit. But to explain the summit's results in these terms is to evade the issue, *viz*, that world monetary reform is most urgently called for to replace the present system of utter dependence on the US dollar.

## *South Africa*

### New Wave of Militancy

THE popular protests which began last year when the white racist regime introduced constitutional changes to provide limited political rights for 'coloureds' and 'Asians' but not the blacks have shown no signs of dying down, despite the most severe repression. In Cape province alone, where some of the bloodiest confrontations have taken place between the regime and black youth, more than 150 persons have been killed in the past four months. In almost every case the police opened fire on unarmed people, but the militancy of the people's struggles has not been dampened. At the recent funeral of 15 blacks killed near Port Elizabeth (such funerals have become a rallying point for protests) no less than 50,000 persons had gathered.

While the confrontations between black youth and the police and the protests directed against those collaborating with the regime have been notable for their intensity, black trade unions have been combining wage struggles at workplaces with political demands. In the Witwatersrand area, a simmering labour dispute involving black workers in the gold mines turned into a major retreat for the owners of the mines. On April 22 the world's biggest gold mine of Val Reefs owned by Anglo-American dismissed 92 black workers for their role in earlier protests at the mines demanding higher wages and an end to racially discriminatory job placements. In the neighbouring Hartebeesfontein mine owned by Anglo Vaals four foremen were similarly dismissed. In protest, 18,000 black workers in these two mines struck work. The companies dismissed 14,400 at Val Reefs and 2,200 at Hartebeesfontein. The National Union of Miners (NUM) which represents 300,000 black miners in 43 gold mines retaliated and for the first time succeeded in thwarting the attempt of the companies to send back the dismissed workers to the black homelands, which has hitherto been used to put down agitations by workers.

The companies had evidently calculated that they could weaken NUM, what with unemployment among the blacks running at 30 per cent and given the relatively high wages in the mines (though black workers get only one-fourth of the wages of the whites and skilled jobs are all reserved for the whites). The calculation misfired and eventually all the dismissed workers had to be taken back. Similar was the experience of the state-owned oil refinery SASOL which decided to teach a lesson to black workers for having struck work to protest against the killing of black youth. All the 6,000 dismissed workers had to be re-employed. In the face of these demonstrations of the collective strength of the black workers, the regime has announced the withdrawal of plants to move 700,000 blacks to new areas.

The strength of the protest actions in South Africa also mark a defeat for the racist regime's strategy of army actions directed against the frontline African states to stop the governments of these countries from extending help to the struggle of the South African blacks. The morale of the South African blacks has not been affected by these efforts to prevent outside help from reaching them.

It is in no small measure due to the strength of the black people's struggle against the racist regime that there are some signs of change in even the US, the bastion of international support to South Africa. The US House of Representatives' Foreign Relations Committee recently

agreed to recommend legislation banning new investments and export of computers and computer technology to South Africa and import of Krugerrand gold coins from there. Already 24 towns across US have removed $ 2.5 billion from companies and banks doing business in South Africa. Six states have likewise adopted laws banning investment of pension funds and other public money in South Africa and 27 others are considering similar legislation. Black trade unions in South Africa want international solidarity actions to be directed not at imposing economic sanctions which in any case do not work but at compelling multinationals operating in South Africa to stop racial discrimination.

## BUSINESS

# Poor Bear Brunt of Protectionism

IMMEDIATE action is required on a simultaneous basis to deal not only with the problem of protectionism but also that of structural adjustment, in particular if there is to be any significant progress in expanding the share of the developing countries in world production and trade. This is the main conclusion of the UNCTAD secretariat's study of 'Protectionism and Structural Adjustment' published recently.

The study draws attention to the far-reaching extent and intensification in recent years of protective actions in international trade. The share of developing countries' imports subject to non-tariff restrictions is far greater than that of imports from developed market economy countries. This is in part a result of the discriminatory application of such measures, which are clearly evident for textiles, wearing apparel and footwear. For example, in the European Economic Community over 80 per cent on average of existing non-tariff measures in these sectors apply solely (or differentially) to developing countries. However, although these measures are directed primarily against the developing countries, the ratios of imports from these nations to domestic consumption are almost always lower than the ratios of other suppliers. In the EEC, for example, developing countries supplied only about 11 per cent on average of domestic consumption requirements of textiles in 1980 and 12 per cent of footwear requirements. In both cases, this was less than half the import penetration ratio for other suppliers.

The increase in non-tariff measures is also a result of the fact that exports of developing countries fall into sectors experiencing structural adjustment problems, in which little progress was achieved in past liberalisation efforts and there has been an increase in the use of protectionist measures. Moreover, recent developments in terms of both actions of a protectionist nature and the introduction of new legislation in certain import markets reflect a movement not towards the reversal of such protectionism but rather towards an intensification of the past trend. Other UNCTAD studies have for example documented the fact that very high and fluctuating levels of protection in agricultural sectors of some developed market economy countries prevent many developing countries from realising their full potential in this area of production. Then again nominal and effective rates of protection in industrial markets have been shown to escalate in general with the degree of product processing. This is a major constraint on the expansion of processing activity in developing countries; other institutional barriers pertaining to shipping, restrictive business practices, marketing and distribution also combine to limit processing activity in developing countries. Also there is evidence of a growing use of industrial policies with trade interventionist and trade divertionary effects by developed countries. In this way any multilateral liberalisation efforts aimed at diluting tariffs and non-tariff restrictions are effectively negated. It is clear, the study therefore adds, that in tackling the problem of protectionism, a key aspect is transparency concerning policies and practices.

Trade liberalisation efforts focused on the key products of export interest to developing countries would result, whether on a most favoured nation or preferential basis, in a substantial increase in exports from these countries and make a significant contribution towards alleviating their debt problems. Such a liberalisation of trade would seem likely to have only a minor impact on the major importing countries in terms of their economies as a whole.

## *Coal*

### Scarcity amidst Plenty

COAL INDIA (CIL) is in a piquant situation with the mounting stocks of coal even as the consuming industries in several pockets in the country have been complaining about inadequate supplies.

According to the annual report of the Department of Coal laid on the table of the Lok Sabha on April 11, pithead stocks of coal have touched an all-time high of 30.42 mn tonnes at the end of March 1985 compared to 22.69 mn tonnes a year ago. The value of coal stocks at the end of 1984-85 is estimated at Rs 700 crore. Naturally this is putting a severe strain on the finances of CIL which has managed to earn a modest profit of Rs 20 crore in 1984-85 after incurring heavy losses in the past several years.

Total production of coal in 1984-85 was 147.45 mn tonnes against 138.22 mn tonnes in 1983-84, thus registering a growth of 6.7 per cent. Of this, production by Coal India was 130.85 mn tonnes against 121.41 mn tonnes in the previous year. While total production of coal in 1984-85 registered an increase of 9.23 mn tonnes, pithead stocks rose by 7.73 mn tonnes. In other words, apparent consumption of coal in the economy in a year of all round growth was no more than 1.5 mn tonnes.

CIL has blamed shortage of wagons for the mounting pithead stocks of coal while the railways have maintained that they had made available an adequate number of wagons for coal movement. The fact, however, remains that many user industries, particularly in the south, have been affected because of inadequate coal supplies. Tamil Nadu government, which was allowed to import one lakh tonnes of coal for its Tuticorin thermal power plant, has sought to import another consignment of equal quantity from Australia. Textile mills, power houses and major industries in Gujarat too have been facing acute shortage of coal on account of poor allotment and highly irregular loading.

Against this background, it is paradoxical that CIL has decided to regulate its production till September this year with a view to producing 3 mn tonnes less than it could have produced. This decision is aimed at reducing pithead stocks.

There is no denying that the railways have been most unwilling to carry coal and the quantity of coal carried by them was much less than the targeted level in 1984-85. As a matter of fact, alarmed by the dwindling supplies of wagons from the railways, the Departments of Steel and Coal have even offered to divert some of their funds for the manufacture of new wagons on condition that these wagons would be owned by SAIL and CIL and would be used exclusively for carrying goods for these two organisations. An inter-ministerial committee is apparently being set up to consider this proposal. The railways, on their own, plan to add only 5,000 wagons to their fleet during this fiscal year which will not even take care of the overaged wagons that may have to be scrapped.

According to the working group on coal and lignite for the Seventh Plan, total production will have to increase from 147.45 mn tonnes in 1984-85 to 240 mn tonnes in 1989-90 at the rate of an average annual growth of 9.6 per cent. Will the railways be in a position to carry this quantity even if the demand materialises?

In this context it may be noted that the Planning Commission had originally set a target of 165 mn tonnes of coal production by the terminal year of the Sixth Plan (1984-85). Demand for coal in 1984-85 as estimated at that time was 168 mn tonnes. After the mid-term review of the Plan, the production target was lowered to 152 mn tonnes. However, actual production was nearly 5 mn tonnes less than the lowered target and even this lower production created a critical situation for CIL because of huge pithead stocks.

Clearly, a more realistic approach to coal planning and better inter-ministerial co-ordination are called for in the Seventh Plan.

## *Rubber*

### Growers versus Users

THE see-saw tussle between natural rubber growers and users appears to have recently tilted back in favour of the former. Over the past few weeks the ex-plantation price of rubber has jumped up by Rs 3,000 to reach Rs 18,000 per tonne. The rise in the case of graded rubber is even higher.

The All-India Rubber Industries Association (AIRIA) has held inadequate production and slim stocks to be responsible for the price rise. Production of essential rubber goods and also those of daily use by consumers is said to have been affected, especially by small scale units. The Association has responded to the changed situation demanding that the Union government at least fulfil its earlier commitment on natural rubber imports. Reportedly, in October 1984 the government had decided to import about 49,000 tonnes of natural rubber to meet the estimated demand-supply gap during the lean season from February to September 1985; the demand in 1985-86 is estimated at 2.5 lakh tonnes. Thereafter, apparently on account of this decision to import as well as due to the incoming produce, rubber prices began to slide down.

This led to considerable discontent among the growers in Kerala, which accounts for much of the country's output. The growers' lobby plays a crucial role in the state's politics. On the eve of the parliamentary poll the Kerala government announced that a buffer stock of 10,000 tonnes of rubber would be created to protect the interests of the planters. Also, it is said that pressure was exerted on the Union government to reduce natural rubber imports.

The AIRIA claims that the Union government has given in to the planters' pressures. The actual quantum of imports so far, the Association states, has been only 12,000 tonnes, and further imports have been suspended. There has been no official statement about a reduction in rubber imports or for that matter of even about the total quantum of imports decided upon earlier. Contradictory information provided by the lobbies of users and growers is all that is available.

There is though one fairly evident explanation for the spurt in rubber prices, namely the rise in demand for tyres, particularly those of automobiles and two-wheelers. This is bound to be so due to the marketing of sizeable numbers of new brands of automobiles and two-wheelers in the recent past.

As yet no concrete moves have been taken towards establishing a buffer stock. The growers' lobby too does not seem to be pressing for it at the moment. This is possibly partly because there is no fresh produce coming into the market. Also the purpose of preventing prices from slipping down, which the buffer stock was to achieve, is not currently relevant in the buoyant market.

## LETTERS TO EDITOR

### Bhopal Tragedy and Sodium Thiosulphate Controversy

PADMA PRAKASH *(EPW* April 6) raises the relevant issue of proper treatment and relief to the victims of methyl isocyanate (MIC) poisoning and correctly points out the harm which indiscriminate use of corticosteroids and tetracycline might cause, especially in pregnant women. However, in demanding a generous use of sodium thiosulphate (NTS), she inadvertently helps in shifting the debate from the real issue of systematic rehabilitation of these victims to one of finding some miracle treatment.

The alleged benefits of NTS therapy seem to have been invoked by some double-blind study conducted by the Indian Council of Medical Research. It is hard to understand why ICMR chose to subject the victims to NTS in the first place, and then kept the details of this study a closely guarded secret.

NTS is a well-established antidote against *acute* cyanide poisoning (e g, hydrogen cyanide, potassium cyanide, sodium cyanide, etc). However, in order for NTS to serve any purpose, it must be administered immediately after the poisoning. That is why in occupations likely to cause accidental cyanide poisoning, ampules of NTS, and sodium or amyl nitrite, another anitdote, are part of the emergency kit.

NTS increases the metabolism of cyanide to the relatively non-toxic sodium thiocyanate. However, NTS cannot exert any effect once the acute phase of poisoning is over, and by no means 4-5 months later. If the victim survives the first few hours, cyanide will be metabolised whether or not thiosulphate is given to the patient. When cyanide is present in the body in trace amounts, no antidote is required. Enzymes normally present in the body can easily metabolise fair amounts of cyanide.

Indeed both cyanide and thiosulphate are present in the human body in small amounts because we consume foods which contain these substances and cyanide is also present in cigarettes. One cigarette may contain as mcuh as 0.1 mg cyanide. So even if any cyanide or cyanates are paresent, attempts to 'detoxify' them by drugs are not rational.

The victims of the Bhopal gas tragedy were exposed to methyl isocyanate and not to cyanide. MIC is not known to be converted to cyanide. Despite the similarity in terminology MIC and cyanides are biologically very different. Hydrogen cyanide can be inhaled and it is the most toxic cyanides. MIC is even more toxic than hydrogen cyanide.

It is possible that NTS may detoxify methyl isocyanate (MIC) into a less toxic molecule isothiocyanate, although this has not been established. However, even if NTS increases the metabolism of cyanate like it does in the case of cyanide, it is very unlikely that MIC will still be present in the body 4-5 months after the tragedy, unless the victims continue to be exposed to this poison.

My reason for writing this letter is not to discuss the medical effects of NTS but rather to emphasise the relevant issue of proper relief and rehabilitation of the victims. Most of the victims who survived the calamity are suffering from the after-effects of damage that has already been caused or was initiated by MIC on December 3, 1984. Some of them are suffering from lung damage and others may be suffering from damage to the liver, kidney, heart and the nervous system. Some of the damage is permanent and some requires appropriate symptomatic treatment. Where possible, the treatment should be directed towards specific complaints. This requires individualised care and there cannot be any universal treatment at this stage. There is no justification for subjecting these patients to useless drugs which can only do harm and offer little benefit. For example, if a patient develops infection, which will occur more frequently in the gas victims, appropriate antibiotics should be given. Routine administration of sodium thiosulphate, glucocorticoids, antibiotics, etc, is of no proven value and is potentially harmful.

All those seriously concerned with the unfortunate victims of MIC poisoning should first and foremost demand a proper home, adequate nutrition and assured income to all victims. The victims should be given jobs which do not demand excessive physical exertion. This is what they need and not mass scale drug therapy. They have already paid a heavy price for the crimes of UCIL and the callousness of the Indian authorities. They should not be made guinea-pigs for the random trial of drugs nor should they be exploited as a market by the pharmaceutical companies.

## Politics of Propertied Classes in Gujarat

I AM writing this with reference to the ghastly violence of April 22 and 23 in Bapunagar and Naroda industrial areas of Ahmedabad. I am referring to these incidents without going into the anti-reservation agitation (about which I have many reservations) and other events in Ahmedabad, since even by themselves these incidents reveal the nature of forces engaged in the orgy of violence. In the land of Gandhi—in direct anti-thesis to the much talked about Gandhian values of secularism, upliftment of harijans and non-violence—we witnessed communalism and casteism directed mainly against harijans and macabre violence.

On April 22, in Ambedkarnagar, a harijan colony in Naroda, two hundred and fifty houses were looted and burnt and a harijan woman was killed. Every resident I talked to gave the same names for the main leaders of the attacking mob. One name is that of a notorious gangster in whose name an illegal settlement stands across the railway track from Ambedkarnagar and other is that of his son who is a ruling party corporator. Both are commonly known to have the ex-home minister of Gujarat as their mentor.

On the late night of April 22 and early morning of April 23, Muslims residing in Indira Garib Nagar, in Bapunagar, were attacked by the residents of the surrounding colonies. About a thousand houses of Muslims were looted, burnt and had their belongings demolished and at least twenty-five persons were killed and injured, mainly fleeing Muslims in mob attack and police firing. According to the Muslim residents, the police was present all the time since a police chawki is right near the spot of the incident. However, the police did not stop the mob attack on Muslims. On the contrary, the police encouraged the mob to attack the Muslims. The entire attack, including looting and burning, lasted at least eight hours in the vicinity of a police chawki. The mob was incited, managed and led by the gangsters and 'pahelwans' whose men were instrumental in first creating tension, then mob frenzy and finally violence. Some of the gangsters named by affected Muslims are even office-bearers of political parties and most of them are well connected with political parties, both ruling and opposition.

These gangsters are not unknown to anyone familiar with those areas. I have participated in workers' struggles against these gangsters since one of their tasks is to break strikes and terrorise workers. The gangster involved in the attack on harijans in Ambedkarnagar was the most notorious of the strike-breakers, until his image was hurt in 1982 when his men were beaten up by agitation workers in the Rakhial area. Mentored by politicians, pampered by industrialists, and befriended by police these gangsters are involved in making hooch to running gambling dens to grabbing and selling public land illegally. In June 1982 I had made a representation to the police commissioner about the illegal harassment and terrorisation of workers by this gang and hundreds of workers participated in a week-long demonstration and agitation in front of the police commissioner's office, albeit without getting any positive help from the police.

The same gangsters have today turned out to be the leaders in perpetrating casteist and communal violence in Bapunagar and Naroda. Industrialists need them to suppress the workers. Election candidates need their support and network to grab votes. Shamefully, the MPs and MLAs from these areas cannot boast of any work among the workers in the area and have to rely on these gangsters for votes.

In Gujarat, the ruling party, opposition and industrialists keep the facade of Gandhism, they talk of secularism and non-violence, maintain Gandhian forms such as wearing khadi and white cap and organising ashrams through public funds—but their political base and support is increasingly rooted in gangsters and not in the masses. The propertied classes and their representatives cannot practice such principles, Gandhian or any other, which can divert them from accumulating more property by the quickest and easiest means. They need gangsters to corrupt and suppress the working people and when necessary to divide them by using even the most naked forms of organised criminal vandalism. In the politics of propertied classes, who are in a rush to grab, loot and beat one another to be among the first to 'enter the twenty-first century', the large section of common people including the middle classes are left with a meagre number of jobs or few seats in higher education (with or without reservation) over which they can continue to fight and kill each other. Politicians can keep them in that game and criminals can lead them in organised mutual killings—so that the rich can continue uninterruptedly to loot the wealth created by the labour of these same common people.

Engaged in their vulgar politics, the ruling propertied classes in the country have obviously found no need to instil genuine secular consciousness in the people. Thus the sentiments of casteism and communalism are definitely there in the masses and, incited and guided by criminals, they do participate in communal and casteist violence. The incidents in Bapunagar and Naroda are acts of criminal vandalism organised by inciting communal and casteist frenzy. Though the situation is dismal and the schism between the working people has widened, the guilty are also isolated and stand exposed. They can be defeated and they must be defeated. Progressive and secular people must work among common people to defeat the vulgar politics surviving on criminals' support.

Ahmedabad

# Waiting for a National Consultation

**Romesh Thapar**

I HOPE the message is going home to those who exercise political power in these troubled times. A little bit of flexibility and responsiveness has earned dividends in Punjab. The way is being cleared for more give-and-take, despite the crazy elements. If the correction is handled with understanding, and without undue importance being attached to the terrorist attempts to throw us into confusion again, there is every possibility of major breakthroughs.

It would be naive to expect an instant dissolution of all tensions. Too many distortions have taken place, and the Hindu-Sikh divide is nourished on a whole lot of historical concoctions which need open and fearless debate and rebuttal on the electronic media. What's more, the terrorists will continue to prowl. They must not be confused with the Sikh community at large, and every effort must be made to narrow their support-base.

The optimism that is beginning to surface after two grim years is reflected in the general reaction to the call by a section of Sikhs that the re-built Akal Takht should be pulled down and built again, presumably in purity. "Well, it's their business. Let them do as they will." If anyone is entitled to interfere, it is Sikh opinion itself—that is, if it can mobilise against adventurer Akalis and opportunist Jathedars.

It is for the Sikh community, better organised than it is at the moment, to put its own house in order. There are many layers of trauma that engulf its members. 'Identity' was demanded, and the end result is minority status. It will take a long time to adjust to this condition, particularly where the more affluent Sikh sections with India-wide interests are concerned. Then, again, a variety of angers might persuade some to honour the assassins and their families, or to turn a hysterical preacher like Bhindranwale into a guru. There will be others in the community to question these desecrations of a faith and a tradition. Clearly, these matters are best left to the community.

The dominant Hindu has to learn to be enlightened, to turn on himself to see what his own contribution has been to the enactment of the Punjab turbulence and its terrible aftermath. If such an exercise is encouraged, particularly by the practitioners of Congress power who don't quite know when they lost their secular and democratic moorings, we might well emerge from this crisis in a healthier frame of mind.

I sincerely hope so, for already the Gujarat events are casting long shadows over this sub-continent. The political balance of his rather prosperous state will never be the same again. The caste wars, conducted with a brutality and criminality never witnessed before (no, not even in communal confrontations!), and involving the supposedly impartial constabulary (and, now, even striking government servants), will require a fundamental revision of our reservation and promotion policies for the whole sub-continent. This cannot any more be done without a national consultation, remembering that we would be stupid to turn our back on backwardness.

A few basic inputs need to be injected into our political assessment. All the religious mumbo-jumbo in Punjab is a cover for the Sikh desire to rule politically in "their" part of India even as the reservation and anti-reservation collision represents a battle to establish that quotas in government education and in government jobs must reflect the numerical percentages of the castes (lower, middle and upper, for simplification) irrespective of merit. In other words, much of the turbulence in India is around populist political power and patronage, and the fact that we no longer have *netas* whose rationality is respected.

Is this understood in democratic depth? I don't think so. The impression is widespread in the changed India of today that a very marked presence in the bureaucracy and in the professions is the key to the future, that this key can no longer be the preserve of the traditional ruling 'minorities', the Brahmins, the Rajputs, and, to some extent, the Banias. What happened many years ago in South India is now seeing a dramatic enactment elsewhere on the sub-continent. Gujarat today. Madhya Pradesh tomorrow. And so on.

Statistics show that despite the emotion expended, the quotas are not filled. The reasons are many. What is of interest is the desire of the new rising castes, particularly those in the middle (describing themselves as 'backward'), to somehow get into the bureaucratic machine where the real power resides. This is the new consciousness.

How do we deal with the problem of growing incompetence in a bureaucracy manned increasingly through a reservationist system of selection? Do we carefully reduce the power of the bureaucracy through meaingful autonomous structures? What is the future of governance as we have known it? Has the over-grown linguistic state to be replaced by smaller, more integral units? The questioning should cut new ground, and help expose our bogus 'principles' of governance.

The drift in our affairs, stretching over several years of manipulated, criminalised and communalised politics, has to be halted by a national consultation wide enough to pack the influence to condition thinking over the sub-continent through a rational and just consensus. There is no escape from this urgent task whatever the quality of leadership available at this moment.

There is an amalgam of hope and hopelessness which has to be catalysed before the alienated, unemployed lumpen mobs, often linked to the underworld, set fire to the achievements of 38 years of freedom and deliver us to the care of armoured carriers with sten-gunners. Military control, let us remember, invariably brings relief, but only temporarily.

All over India, the disintegration of the norms, disciplines and accountabilities of a democratic, federal state is visible. We only focus on the explosive collisions, but there are so many districts in the sub-continent which are already the very private preserve of local police and local politician. No government writ really runs in these areas, and all the surface signs suggest that these aberrations are acceptable, that we are asked to live with them.

No party attempts a sustained effort to break the power of this modern *thugee*. If the ruling Congress is for ever lampooning the Opposition, even describing it as something dependent on foreign props and inspirations, the Opposition waits for a chance to swing the vote and to do unto the Congress what has been done unto it. These are amoral games of profit. No alternatives are involved.

Unless these alternatives are fashioned by every possible means available to us to involve the people in the organisation of their life and its management, the confusion and chaos will continue to spread. We keeping hoping for a change, even vote for change, but the hopelessness returns to us because actually nothing really changes. The lobbyists for the corrupt *status quo*, or for a more irresponsible money-making spree, are too active, too entrenched. We are in a tunnel, and there is no light at the end. Yes, one needs a cliche to describe a cliche situation.

*May 3.*

# When Soviet Union Attacks France . . .!

**GPD**

WE had no idea that we might have to return to the subject of films so soon after we wrote about the Radha-Krishna affair in Bangladesh. Now, however, the gem of film-making under discussion comes from Paris. It seems one Yves Montand has produced a two-hour 'semi-documentary' film for the television entitled "Confronted by War" in which a Russian army of the future is shown invading France. Those who are interested in 'form' and things like that might see many possibilities in the futuristic documentary that this film claims to be. Why the *Times* of London described the film as a semi-documentary, we do not know.

The Russians, of course, got very angry. The embassy said that despite an early protest to the French Foreign Ministry while the programme was being prepared, "this filthy lie against the Soviet people was nevertheless shown on French public service television . . . The inaction of the French authorities in this affair amounts to tacit approval of the propaganda of sentiments of animosity and distrust towards the Soviet people."

The embassy further noted the timing of the film. The fortieth anniversary of the victory over fascism is being celebrated. Right at that hour comes Montand's filmic achievement. The timing made it worse all right; but the Russians' sense of anger would not have been any the less sharp had the film been made last year or the next year.

These games are not new. In 1960 came out a novel by a chap called Constantin Fitz Gibbon entitled "When the Kissing Had to Stop". Fitz Gibbon obviously was of the impression that, like the censors of Indian films, the socialitsts from Moscow do not like to kiss. At any rate his novel is about the Soviet takeover of Britain. The result of course is that the kissing had to stop. But the Fitz Gibbon story ended with the words "it was a wet autumn and cold winter in England". For us Indians, this seems to be always the case. For Fitz Gibbon, however, this was the result of the Soviet takeover, through their cronies. As a political thriller the novel was bad, a shade boring, one cannot read two hundred and fifty pages to discover that it was a wet autumn and cold winter in England. More painful and also more dastardly was the "wet autumn and cold winter" introduced by the Americans in Indochina. In Indochina the living, let alone the kissing, had to stop. Fitz Gibbon was not worried about that. So as the Americans were busy taking over Vietnam, Fitz Gibbon was producing political thrillers about the Soviet takeover of little England.

Montand has done something similar, except that he has done so on the Idiot Box. Giving extraordinary importance to films, its excessive glamorisation result in the extraordinary sensitivity with which people react to whatever appears on the screen. The Russian reaction was, therefore, understandable. That the French television should have shown this film when the Socialist Mitterand is in power must have been particularly galling. The French Communist Party was understandably very angry and *L'Humanite* described the film as "a gross operation of bellicose propaganda telecommanded by the Elysee". One can be reasonably certain that the controversy must have died a natural death by this time. A little celluloid storm contributing, no doubt, to Montand's popularity and attaching a certain curiosity value to his film.

The interesting part of the whole story, however, is that Montand had been a long-standing Communist activist himself. It is very strange indeed that after every other worthy in the world had declared the Soviet Union as anything over but a socialist state and the 'party' as the worst plague that can take over those who wish well of humanity, so much of propaganda talent is wasted on them. With the arrival of Eurocommunism there is little to choose between the communists and social democrats in West Europe. It will require the sense of fine classification and distinction of Sanskrit grammarians to see the difference anyway. Why are the Montands of the world concentrating their fire on the not-so-socialist Soviet Union is a mystery. Perhaps Deng Xiaoping might know. In the meanwhile one thing seems to be certain. Whatever might have happened to the socialists in Moscow or in Beijing for that matter, anti-communists have not changed much. This is the reason why the turncoats or anybody else who is available is being used in the new cold war introduced by Carter and actively promoted by Reagan.

The curiosity value of the Montand film is not limited to this alone. The French government confirmed the receipt of the Soviet note of protest. The explanation that it gave was, however, interesting. The French foreign office said that it rejected the protest note because of its "extreme tone" and because the French government respected the principle of freedom of information. A film about a "future" attack on France by the Soviets constitutes "information" in that country. It might be interesting for some Asian state or a Latin American state to make a film about a "future" attack on that state by France. It would be nice to find out what Mitterand and his friends think about it.

# Legislation on Phone-Tapping

**A G Noorani**

THE Interception of Communications Bill introduced in the British House of Commons recently deserves careful study in India. As the White Paper on the subject published in February 1985 (Cmnd 9438) recalled, "The European Court of Human Rights gave judgment in August 1984 in the Malone Case, which concerned telephone interception on behalf of the police. The Court acknowledged that detailed procedures existed governing the interception of communications and interception under these procedures was lawful under English law. It concluded, however, that the law did not indicate with reasonable clarity the scope and manner of exercise of the discretion conferred on the public authorities. In an earlier case in 1978 (involving the Federal Republic of Germany) the Court had recognised the necessity of legislative powers to intercept communications in strictly defined and limited circumstances. The relevant Articles of the European Convention on Human Rights are set out in Annex I with references to the two cased cited." The cases are Klass and Others decided on July 4, 1978, and the Malone case decided on August 2, 1984. The relevant provision is Article 8 of the European Convention for the Protection of Human Rights and Fundamental Freedoms. It embodies the right to respect for a man's "private and family life, his home and his correspondence".

Now this is precisely the guarantee embodied in Article 21 of our Constitution. 'Personal liberty' which it guarantees includes all those categories listed in Article 8. Curbs on 'personal liberty' can only be made under the authority of a law which, in turn, must not be violative of other fundamental rights such as those embodied in Article 19—free speech, etc.

Britain is enacting legislation in order to conform to the Court's ruling. Hence the safeguards provided for in the legislation. The point is that without the safeguards—especially that of an independent Tribunal—the Indian law is violative of Articles 19 and 21 and is therefore unconstitutional.

Clause 2 empowers the Secretary of State himself—not a civil servant or Police Commissioner—to issue a warrant for phone-tapping in three cases only: "in the interests of national security", "for the purpose of preventing or detecting serious crime", and "for the purpose of safeguarding the economic well-being of the United Kingdom". In the last of these three cases, the information sought must relate to the acts of persons outside the country.

The Bill proceeds to lay down detailed requirements of a valid warrant. It must be signed by the Home Secretary himself save "in an urgent case" when it can be signed by a civil servant expressly authorised by him.

The Home Secretary is enjoined by clause 6 of the Bill to ensure that certain safeguards are observed in order to minimise the invasion of privacy—the extent of disclosure of the material intercepted, the number of persons to whom it is disclosed, extent to which the material is copied, the number of copies, etc.

A Tribunal will be set up. "Any person who believes that communications sent to or by him have been intercepted in the course of their transmission by post or by means of a public telecommunication system may apply to the Tribunal for an investigation under this system." Thus the Tribunal will consider complaints of phone-tapping as well as postal interception. Indeed the entire discussion above is fully applicable to postal interception.

The Tribunal will investigate whether there is a relevant warrant and a relevant certificate containing the details. If there has been such a contravention, the Tribunal will "report" accordingly to the Prime Minister herself giving its "findings" and give a "notice" to the applicant "stating the conclusion". Note the differences between the two intimations.

The Tribunal is empowered also to make an order quashing the warrant or the certificate, direct destruction of the copies of the intercepted material, and direct the Home Secretary to pay compensation to the applicant. No appeal lies against the decision of the Tribunal nor can it be questioned in any Court.

The Prime Minister is directed to appoint as Commissioner a former High Court Judge or a person who has held high judicial office to keep under review the warrants issued by the Secretary of State and to assist the Tribunal. The Commissioner reports directly to the Prime Minister any cases of contravention which he detects. He also submits an annual report which is placed before Parliament—subject to deletion of material prejudicial to national security or the prevention or detection of crime or the economic well-being of the realm.

It is made an offence intentionally to intercept a communication except in accordance with the provisions of the new law. But proceedings can be launched only by the Director of Public Prosecutions.

The Tribunal will consist of as many as five persons each of whom shall be lawyers of at least ten years' standing. They are appointed each for a five-year term. There will be a President and a Vice-President of the Tribunal. In short, it will be a high-powered body. The Tribunal will determine its own procedure.

These are the barest minimum safeguards. Without them the Indian law—Section 5(2) of the Indian Telegraph Act, 1885 and Section 26 of the Indian Post Office Act, 1889, which respectively enable phone-tapping and mail interception—are violative of fundamental rights and therefore unconstitutional.

APPOINTMENTS

**WANTED**

A reliable company of north India requires the services of some experienced sales representative to sell their household and domestic article of daily need. Salary Rs. 1,000 plus commission and other benefits extra. A self stamped envelop must be accompanied. Apply in English or Hindi only to:

Kamla Nagar, DELHI - 110 007

# Getting Ready for Competition

**Hansavivek**

*MAHINDRA AND MAHINDRA* has shown good results for 1983-84 with higher production, sales and profits. Turnover amounted to Rs 368.33 crore against Rs 314.01 crore in the previous year and gross profit increased fom Rs 22.63 crore to Rs 26.91 crore, reflecting a modest improvement in margins. These results have been obtained despite pressure on costs. Net profit is Rs 14.59 crore (Rs 13.52 crore). Dividend is lowered by two points to 18 per cent, but is payable on the capital enlarged by the bonus issue. The increased quantum of distribution is still covered 4.23 times as against 5.85 times previously.

The company produced 32,788 vehicles against 32,077 in the previous year and sold 32,607 against 32,201, even though exports to Iran dropped from 2,976 to 1,829. Sales of spare parts inclusive of petrol and diesel engines rose to Rs 16.30 crore from Rs 13.78 crore. The Igatpuri plant produced Peugeot diesel engine model XDP 4.90 with progressively higher deletions. The International Tractor division fared very well with record production and sales of tractors. The number of tractors produced increased from 11,901 to 15,900 and the number sold from 12,507 to 15,754. The company increased its market share from 17.3 per cent to 19.7 per cent. Sales of spare parts, kits, attachments and implements were Rs 9.64 crore against Rs 8.14 crore. Total foreign exchange earnings from export of vehicles fully built-up and completely knocked down, tractors, spare parts, merchant and deemed exports amounted to Rs 20.84 crore. The instrumentation division's sales of instruments and spares amounted to Rs 1.46 crore against Rs 1.44 crore. The division executed an order for 15 sets of hydraulic regulators, manufactured under the new collaboration agreement with Comp-Air Industrial, UK. The division has concluded selling agency agreements for a range of new instrumentation products manufactured by Pyrosystems, Madras, and Controls and Automation (India), Hyderabad.

The steel division had to contend with depressed conditions in the international steel market. USA imposed restrictions on steel imports in order to protect its domestic steel industry. Most of the steel exporting countries were keen on obtaining a share of India's steel import business and there was severe competition in this sphere of activity. The market for special steel in India improved which brought about overall improvement in the performance of the division. In line with the previous year's performance, the machine tools division secured orders worth Rs 6.07 crore, of which orders worth Rs 4.45 crore were executed. It has a healthy order carry forward of Rs 5.70 crore in spite of recessionary trends prevailing with user industries. This performance has been possible because of the steps taken to broaden the division's base of activity by acquiring new franchises for high technology machine tools from Japan and USA. The new franchises have a good market potential. Efforts are continuing to further widen the base of the division's activity.

The proposal to amalgamate Mahindra Spicer with the company with effect from April 3, 1984 was approved by shareholders of both the companies. The company is awaiting the necessary approval of the Central government, under the MRTP Act, and the final sanction of Bombay High Court. Commenting on the current year's prospects, the directors say that in the first quarter the company produced 8,024 vehicles as against 6,572 in the corresponding period last year and sold 6,485 against 5,222. In the case of tractors, production and sales have been 3,606 and 3,286 as against 3,452 and 3,520 respectively. In regard to the vehicles, the directors point out that with the liberalisation of the government's policy and with the entry into the market of new manufacturing units, the market situation will be much more competitive. Efforts are being made to meet this situation, they add.

*PRESSURE COOKERS AND APPLIANCES*, after intensive R and D for some years, has introduced a new model pressure cooker 'Hawkins Futura' with outstanding beauty and extra safety and convenience features. It has been well received in Australia and is being launched in India. Meanwhile, the company has received from the government re-endorsement of its registered capacity from seven lakh numbers pressure cookers to 9.93 lakh numbers per annum. In its silver jubilee year ended September 1984, the company has shown good results with higher production, sales and profits. On sales of Rs 18.71 crore against Rs 14.37 crore in the previous year, gross profit has risen from Rs 90 lakh to Rs 156 lakh. These figures reflect enhanced profit margins. This is particularly significant, since the company had to contend with active competition in the market from over 40 brands of pressure cookers and the 20 per cent disallowance on advertising and sales promotion expenditure for the computation of tax. The directors point out that this disallowance has resulted in reducing the company's profit after tax by about Rs 11 lakh. Net profit doubled to Rs 52 lakh. Dividend has been stepped up three points to 19 per cent which is still covered 1.73 times by earnings as against 1.24 times previously.

*EXCEL INDUSTRIES* has suffered a setback in its working during 1983-84 with gross profit declining from the previous year's Rs 4.58 crore to Rs 2.91 crore despite increase in sales from Rs 37.90 crore to Rs 40.59 crore. These figures show a significant deterioration of margins. The management attributes this outcome to an increase in competition with the introduction of synthetic pyrethroids coupled with increased cost of inputs and substantial rise in interest on borrowings. The increase in cost could not be passed on to the customers due to the prevailing market conditions. Net profit is only Rs 108 lakh compared to the previous year's Rs 282 lakh. The directors have recommended a dividend of 15 per cent on the enlarged capital, which is covered 1.56 times by earnings as against 4.41 times previously when the company had paid 25 per cent on the old capital. The company has fared well on the export front with exports of Rs 4.24 crore against Rs 3.76 crore previously. It incurred capital expenditure of Rs 190 lakh to expand and modernise the existing plants and for the installation of new plants.

The company is implementing at Bhavnagar its programme to manufacture butene diol, which is one of the basic raw materials for manufacture of endosulfan. The first phase of the project is expected to be over this year and the second phase by the middle of the next year. This will reduce the cost of manufacture of endosulfan. In respect of its plant for manufacture of ceramics, the company has signed an agreement with Agrob Anlagenbau, West Germany, for the import of plant and machinery. The plant is expected to commence production during 1985-86. In keeping with its policy as a corporate citizen, the company is shifting its manufacturing operations away from the cities as far as possible. Accordingly, in addition to the Roha site, it has taken a plot of land at Lote Parshuram, near Chiplun in Maharashtra. The company's major activities will be coming up at Roha and Lote Parshuram. A plant for manufacture of glyphosate, a world renowned weedicide, is being installed at Roha. This will be ready for commissioning this year. The plant to manufacture sodium penta chloro phenol is in offing at Lote Parshuram.

*SWARAJ MAZDA* is coming to the market with an issue of 47,24,930 equity shares of Rs 10 each at par to raise a part of the finance required for its Rs 48 crore project for manufacture of 10,000 light commercial vehicles per annum. Out of this issue, 10 lakh shares have been reserved for preferential allotment to non-resident Indians and persons of Indian origin settled abroad. The subscription list for NRIs is opening on May 6 and for the Indian public on May 24. The company has been promoted by Punjab Tractors in technical and financial collaboration with Mazda Motor Corporation and Sumitomo Corporation, both of Japan. Punjab Tractors has contributed 29 per cent of the equity capital of Rs 10.50 crore and the two Japanese firms 26 per cent. Punjab Tractors is engaged in the manufacture of tractors, self-propelled harvester combines and automotive castings. It has a good track record of growth and the book value of its ten rupee equity share exceeds Rs 60. Mazda is a world leader in automotive innovation. It is Japan's third and world's ninth largest automobile manufacturer. Sumitomo is one of Japan's largest trading houses with diversified business interests extending to automobiles, iron and steel, chemicals, textiles, etc. The project has been set up at village Arson in Punjab, 45 km from Chandigarh. Trial production has already commenced and commercial production will start from July 1985. The project is being implemented in three phases. The first two phases, estimated to cost Rs 32 crore, have been implemented. The last phase, which will involve a capital outlay of about Rs 16 crore, will be taken up later and would be financed largely by borrowings and internal cash accruals. According to Chandra Mohan, Vice Chairman and Managing Director, the company's product is Mazda's latest T-3500 diesel truck with a load carrying capacity of 3.5 tonnes. Introduced in Japan in 1984, this model has become a market leader. Highly fuel-efficient, this LCV is ideal for Indian road conditions. The demand for LCVs has been steadily growing and is expected to be in the region of 81,000 to 1,00,000 numbers by 1990. Investors in the issue will be entitled to 80 CC and Wealth Tax benefits. The public issue is managed by DSP Financial Consultants and the Merchant Banking Division of Indian Overseas Bank. Citibank is a co-manager to the issue.

ANOTHER PRESTIGIOUS PUBLICATION
FROM U D H PUBLISHERS

**FUTURE BUDDHA**

By Dr. Shambhu T. Merani
1985/Pp 100/Price Rs. 200/-

Millions of young persons around the world are disillusioned, alarmed and fed up with the past and their own inheritance of it. And, the senior ones are disturbed as well. Some less, some more. It was in the past that **SIDDHARTHA** came. And, when he came he found there were old ones, sick ones and dead ones. He dreamt seven fears. He also heard "a moan, a sigh a sob, a storm, a strife". Now, however, all are looking forward to something totally different, imaginative, thoughtful and daring. This is what the "**FUTURE BUDDHA**" is about.

The book "**FUTURE BUDDHA**" consists of about 100 pages in 13 groups. It has original paintings (nearly 35) of Buddha specially done for by an Indian artist of national fame. The book is nicely produced on Art paper. Each page of the book is a scene, poetic in imagination and expression, with thoughts about distant future. These are Postures of the Mind. What the "**FUTURE BUDDHA**" may find whenever he appears, again and again, as "Earth-Witness" at different points of time. There are some quotations in group-one in the book which deals with the life of **SIDDHARTHA**". Of these, some are quotations from the "Light of Asia" by Edwin Arnold.

# Cheers for Congress Socialism

**BM**

CHEERS have gone up from self-styled leftists and socialists of many hues inside the ruling party and others associated with it in various ways for the strength of what is called 'Congress culture' which is supposed to have been on glittering display at the first session of the All-India Committee of the Congress(I) under the presidentship of Rajiv Gandhi and at the centenary celebrations of the Indian National Congress. The word socialism had been conspicuously missing at Congress(I) talking shops in recent months. This had made the leftists and socialists referred to above nervous, more markedly after the presentation of the first Budget of Rajiv Gandhi's government. But apparently socialism is back in fashion in the ruling party and everything is now all right, in spite of the budget, the import-export policy, and much else. The leftists and socialists regard this as a triumph of their faith in the Congress culture. What they call the Indian brand of socialism is now safe in the hands of Rajiv Gandhi.

Before the Congress(I) session, which dutifully elected Rajiv Gandhi president of the Congress(I) and thus confirmed his position as the supreme leader of the ruling party, these leftists and socialists had begun laborious exercises to re-interpret socialism of the Congress(I) variety. This was prompted by the praise and support which spokesmen of big business interests, Indian and foreign, were extending to what were euphemistically called the pragmatic economic policies of the new government. This had greatly embarrassed the leftists. But their faith in the ruling family and its progressive credentials being unshakable, they took it upon themselves to indulge in some ideological gymnastics to justify the government's policies.

Fine distinctions began to be made between socialist pattern and socialism and between the Indian brand of socialism and classical socialism. The more clever went so far as to suggest that the Nehru precept of socialist pattern should not be vulgarised by loose talk of full-fledged socialism. Difficulties in arriving at a proper perception of what was happening under the leadership of Nehru's grandson had arisen, according to them, because of such vulgarisation, presumably under the somewhat impetuous leadership of Indira Gandhi. The socialist pattern did not bar the growth of private enterprise. There was need, in fact, for encouraging investment in the private sector. Hence the budget of the new government of Rajiv Gandhi fully conformed to the socialist pattern as originally conceived. It, therefore, deserved to be supported rather than criticised by leftists and socialists.

But, in spite of such ingenious explanations, misgivings still persisted among the so-called leftists and socialists, inside and outside the ruling party. These misgivings apparently found articulation at various levels within the party, including in the Congress(I) Working Committee, as well as among supporters formally outside the party. There was no doubt, of course, about their loyalty to the leader. But the Congress(I) leadership and Rajiv Gandhi seem to have been persuaded to respond more warmly than would have been the case in the past to the sentiments of the rank and file. The AICC resolution on economic policy had been originally framed in a stridently modern idiom such as has been used in recent months by Rajiv Gandhi and his close friends and admirers. But the resolution was suitably amended to accommodate the more archaic sentiments of socialism and leftism in the party.

The setbacks in the assembly elections and the bye-elections must have influenced the adoption of a more accommodating response to populist sentiment. But the amendments to the resolution on economic policy have been duly hailed by interested quarters as a return to socialism of the Congress(I) variety. The distinctive quality of Congress culture is claimed to be its ability to respond to the sentiments of all classes—feudal and capitalist as well as peasant and proletariat—and to 'democratically' reconcile their clashing interests. With the use of the magic word of socialism in the AICC resolution and speeches all doubts on this score are claimed to have been resolved for the leftist and socialist admirers of the Congress(I) and its leader.

As for those who had earlier hailed and still hail the government's pragmatic policy changes, they are shrewed enough not to be upset by more words. They understand that one feature of the Congress culture is the hiatus between words and deeds and so long as the government's deeds suit their interests, the party leadership should feel free to indulge in socialist rhetoric. The most striking aspect of the AICC session, therefore, has been the ability and willingness of the Prime Minister to learn the ropes and adapt himsef to the demands of the so-called Congress culture.

It was as part of the rhetoric that the Prime Minister affirmed that there would be no cut in the size of the Seventh Plan or in the outlay on public sector industrial and commerical enterprises and on mass welfare programmes. How exactly he proposed to restore the cuts already made by the Budget of his government for 1985-86 was, of course, not considered. In this context it is relevant to point out that the Prime Minister has quite casually twice postponed meetings of the full Planning Commission proposed for finalising the size of the Seventh Plan, taking into account the allocations made in the Budget for the first year of the Plan and the overall resources position during the Plan period in the light of the fiscal policies and investment priorities of the government as outlined in the Budget.

The question of giving final shape to the Plan, including its overall size, is indeed being side-lined in a cavalier fashion. The Planning Commission's meetings with the state governments on their annual and Five-Year Plans are admittedly aimed only at arriving at 'working arrangements'. Such exercises in make-believe planning in Yojana Bhawan cannot hide the fact that serious and effective planning is at a discount under the present political dispensation. The position actually appears to be worse than it was in the era of what is called the Plan holiday in the sixties. Then annual plans were at least attempted to be drawn up with more application and dedication.

It is also not fortuitous in this context that what is called the 'trickle down' theory has been abruptly raised by interested quarters as a subject of serious discussion. This has received a big impetus from a study of the National Council of Applied Economic Research which claims that there has been a steady improvement between 1970-71 and 1981-82 in the consumption standards of the poorest segments of rural households and, what is more, a fall in the consumption standards of the upper income brackets. On this basis it is implied that there is no need for any special poverty alleviation programme and growth by itself should be the prime concern. It is also implied that the benefits of growth achieved by relying on market forces, without attempting to force the pace of savings among the upper income brackets to find resources for the public sector development plan, would in due course trickle down and thereby resolve the problems of growth as well as poverty.

The Deputy Chairman of the Planning Commission must have felt quite awkward when he was called upon to preside over the release of the NCAER study. He tried his best to sound a note of caution against wild conclusions being drawn from the supposed findings of the study. While Manmohan Singh noted that lower income levels in rural areas had benefited from growth and that the argument that growth did not trickle down at all may not be wholly valid, he urged that an integrated national planning effort was nevertheless needed to effectively tackle the problem of poverty in the country. He also sharply questioned the assumption that the country had reached the "end of the road" in resource mobilisation for public sector investment and strongly urged that the problem of additional resource mobilisation be tackled "here and now" Within the limitations of the office he holds, Manmohan Singh went as far he could to publicly plead for effective development planning—a responsibility which is being evaded or avoided by the political authority. It is not clear whether the planners can feel a little more reassured about their role after the latest demonstrative left-ward lurch by the ruling party. There is no evidence that deeds will follow words in the critical area of resource mobilisation for planned investment according to a socially meaningful order of priorities, let alone advance towards a socialist order. As matters stand, and going by deeds rather than words, the official scheme of things will, as Manmohan Singh so well put it, open out ways for 100 million Indians to enter the 21st century while 700 million remain in the 19th century.

# Black Laws in Punjab

## Report of an Enquiry

IN October 1983 Punjab was put under President's rule. This was followed by a spate of laws: Punjab Disturbed Areas Act, 1983, the Chandigarh Disturbed Areas Act, 1983, the National Security (Amendment) Acts, 1984, the Armed Forces (Punjab and Chandigarh) Special Powers Act, 1983, the Code of Criminal Procedure (Punjab Amendment) Act, 1983, and finally the Terrorist Affected Areas (Special Courts) Act, 1984.

These laws give extraordinary powers to the army, police and the judiciary and have the effect of bypassing all safeguards incorporated in the ordinary criminal law to ensure a fair trial and legal justice. This question has been pushed to the background by a succession of events: the army action in June 1984, the assassination of the Prime Minister in October 1984 followed by widespread massacre of Sikhs. The events preceding President's rule and those following thereafter have traumatised Punjab and the entire country and left in their wake a grave communal situation. In this context, the continuance of the above laws in Punjab acquires a new and troubling significance.

The government rationale for these laws is that they are necessary to deal with extremist violence. It is not our contention that no danger exists from communally-motivated terrorist violence. But nor can it be the contention of any sane person that the entire Sikh community is guilty of 'extremism'. And yet by the imposition of these laws the entire people of Punjab are being deprived of the rights guaranteed in the Constitution and thousands of ordinary citizens being made to bear the brunt of their operation.

This was the finding of a fact-finding team sent by the People's Union for Democratic Rights, Delhi, in March 1985. The task of the team was to investigate the impact of these laws on ordinary people and whether the laws were effective in terms of their stated objectives. The investigation revealed that not only were the laws ineffective with regard to their stated purpose, but worse, are helping to further communal alienation and create a climate favourable for communal terrorism. This is a consequence of the anti-democratic nature of the laws and the wide scope they provide for arbitrary and indiscriminate application.

The evidence documented in the PUDR report relates in the main to what followed after the army entry in the Golden Temple in June 1984. Combing operations were undertaken in the rural areas, and those arrested from both the Golden Temple and the villages were placed in army camps. These included women and small children. At Amritsar there were four such camps. After the army was removed, the police has been continuing its search for terrorists and making indiscriminate arrests. The number of arrests remain disputed and unverifiable (at present, the government figures for those in custody are around 850). While some of those arrested were released, the rest were transferred to different jails and placed under the jurisdiction of various Special Courts, the most important being the Jodhpur Special Court.

The information collected points to widespread use of torture, fabrication of evidence, severe harassment of families of which male members are missing/absconding, mindless and arbitrary use of laws often either to settle personal scores or to teach a lesson to anyone who dares to voice any protest against anti-democratic laws and procedures. Specific attention was given in our investigation to the functioning of the Special Courts to which a substantial portion of the report is devoted.

### I

The Terrorist-Affected Areas (Special Courts) Ordinance was promulgated on July 14, 1984—10 days before Parliament was to sit. The Act was passed to "provide for speedy trials of certain offences of terrorist-affected areas and for matters connected therewith". The Sate of Punjab and Union Territory of Chandigarh were declared "terrorist-affected" in August 1984. Three judicial zones were created each with a Special Court. The Special Courts were established at Patiala, Jullandhar and Ferozepur. Subsequently seven Additional Special Courts were set up: two at Amritsar and one each at Hoshiarpur, Ludhiana, Patiala, Bhatinda and Chandigarh.

Anyone who has committed almost any crime can be tried in a Special Court. The definition of terrorist is itself wide enough to include just about anyone.

Section 3(h) defines a terrorist: "a person who indulges in wanton killing of persons or in violence or in the disruption of services or means of communications essential to the community or in damaging property with a view to:

(i) putting the public or any section of the public in fear; or

(ii) affecting adversely the harmony between different religious, racial, language or regional groups or castes or communities; or

(iii) covering or overthrowing the government established by law; or

(iv) endangering the sovereignty and integrity of India."

Thus any person committing any offence listed in the schedule can be tried in a Special Court. In fact section 7(1) (b) of the Act states that all other cases involving scheduled offences committed in such area pending before any court shall be transferred to the Special Court. The schedule in the Act has been expanded to include offences ranging from offences against the state to criminal intimidation. Even a person wholly unconnected with terrorist activity can be tried under the Special Court. For instance, at Amritsar in the Additional Special Court of Additional Special Courts Judge G L Chopra a case is pending involving a murder committed in a village. The incident occurred on the night of January 7/8, 1985 at village Thada, Kathu Nangal P S, district Amritsar. FIR No 9/85 records that Mahendra Kaur, her husband Dayal Singh and their elder son had gone to their tubewell to irrigate their fields. The elder son was away; the husband and wife were sleeping in the tubewell room ('bambi') with the door open when one Kewal Singh and another man are alleged to have entered and hacked Dayal Singh with a 'datar' (sickle).

Another case, FIR No 97/84 also pending before the Additional Special Court at Amritsar, involves a dispute between brothers of village Jethuwal. One of them, Karnail Singh, is alleged to have given kirpan blows to his brothers, his niece and sister-in-law. This case came up at the Jallandhar Special Court and was later transferred to the Additional Special Court of G L Chopra at Amritsar. Again case FIR No 250/84 of August 29, 1984 relates to a dispute over the sharing of land within the family at village Sidhar, P S Beas, district Amritsar, leading to murder. The son and daughter-in-law along with two grandsons of the deceased have been arrested. Their case came up before the Jullandhar Special Court and from there it has been transferred to the Additional Special Court at Hoshiarpur 200 km from Amritsar.

Each case first comes up before the Special Court at the zone level and then it is transferred to any of the seven additional Special Courts. Now all criminal cases involving offences in the schedule are tried by these Special Courts. The police can present the challan within a period upto one year. This means the person can be held as undertrial upto one year without the possibility of bail or recording his confession. This has opened avenues for the police to make money by accepting bribes in order to present the challan. A person finds himself in jail without conviction for a year in offences where if found guilty he would be given a few months' imprisonment.

The bulk of the cases in the Special Courts relate to offences under the Arms Act. The way out for those who are alleged to have committed an offence under this Act is to confess and be released. At Amritsar of the 27 cases disposed of in the Court of H S Sahni 26 were confessions and one was transferred.

Worse, the work that was being done by 18 sessions and addl sessions Judges plus about 25 magistrates is now being done by three Special Courts and seven Additional Special Courts. This itself defeats the purpose of the Act.

As a result of this the dates of hearing fixed are with gaps of 6-8 months, sometimes longer. This is not taking into account the delay in filing charges after detaining the accused. Some examples are given below:

(1) State *vs* Ajit Singh: The accused was chargesheeted on 19.10.84 and the next date of hearing is fixed for 28.8.85. This case has been transferred from Jullandhar to Amritsar. After transfer the date is likely to be extended.

(2) State *vs* Buta and others: A case under Sec 302 from village Jalalpura. Accused chargesheeted on January 21, 1985. Next date of hearing is November 1, 1985.

(3) State *vs* Jagtar Singh, etc: Case under Sec 302 from village Sudhar. Accused chargesheeted on March 15, 1985. Next date of hearing is December 9, 1985.

(4) State *vs* Vishwanath and others: A case under Sec 307 IPC. Accused chargesheeted on November 15, 1984. Next date of hearing is November 15, 1985.

(5) State *vs* Gurdip Ram: Case of Karunpur village in Jullandhar district under Sec 302. Accused chargesheeted on 20.10.84. Next date of hearing fixed for 9.9.85.

(6) State *vs* Lal Singh, R/o Lamma Pind, district Jullandhar: A case under Sec 307. Charges framed on November 2, 1984. Next date of hearing September 27, 1985.

(7) State *vs* Bakhtamar Singh, R/o Jandiala, district Jullandhar: Charged under IPC 302. Arrested on July 24, 1984. Chargesheeted on January 1, 1985. Trial to begin on October 1, 1985.

(8) State *vs* Daljit Singh, R/o Harpura village, district Gurdaspur under Sec IPC 302: date of arrest January 30, 1984. Procedure for framing charges began on June 18, 1984 and chargesheeted on November 12, 1984. Trial fixed for November 22, 1985.

Both Hindu and Sikh advocates told us that it was virtually impossible to get bail in Special Courts even in ordinary criminal cases, which are bailable, since the police are not obliged to produce challans for a year. Under the Act no one can get anticipatory bail and there are severe limitations on granting of bail.

In Manohar Singh *vs* State of Punjab (SLP) (609 of 1985) the Supreme Court released the appellants (the accused) on bail after the Jullandhar Special Court had refused. This was a case in which the appellants were accused under S 153 A, IPC of stopping a rickshaw carrying two Sikhs wearing black turbans and exhorting them: "get united and we shall drive out Hindus from the State". This was an incident which was supposed to have taken place on June 28, 1984 but no challan was presented at the Court till February 22, 1985. The first informant (on whose basis the FIR is supposed to have been filed) made a statement before the Deputy Commissioner, Gurdaspur, denying that he had ever made such a complaint. A copy of the affidavit of the first informant disavowing all knowledge of the incident was presented before the Judicial Magistrate, Batala. Amar Chand, the rickshaw-puller also filed an affidavit before the Special Court stating that he was not a witness to any such incident. Despite this the Special Court at Jullandhar rejected the bail application on 11.11.84. The accused were released on bail by the Supreme Court by the order of Justices A P Sen and D P Madan.

According to Minister of State for Home Affairs (March 28) there were, as on March 22, 1985, 3,264 cases pending in Special Courts. While 1,785 trials were completed out of 1,976 trials being conducted, in 744 cases there were confessions. We were told that most of these were charges under Arms Act (1983) where even a pen-knife (with a 5 cm blade) is considered illegal. Though the punishment is usually a few days' imprisonment or fine, in most cases the accused have spent months in police custody.

On the day the PUDR team visited Amritsar, there were 724 cases pending before the two additional Special Courts, the majority are offences under the Arms Act. The undertrials who have been languishing in jail have moved the High Court and the Inspecting Judges of the High Court that the Special Courts were giving very long dates. The former has directed them to give shorter dates.

The Special Courts violate Articles 14 (right to equality) and 21 (personal liberty).

(1) Ordinary criminals in other parts are not tried by Special Courts.

(2) Keeping accused in jail over such long periods amounts to violation of the first principle of criminal law—accused is presumed to be innocent until found guilty.

(3) The Special Courts do not distinguish between classes of offenders, i e, between people accused of being terrorists and people accused of offences arising out of family disputes, rent, etc.

(4) The ordinary class of alleged offenders are being denied: (a) anticipatory bail, (b) bail in bailable or non-bailable cases as under ordinary criminal law, (c) the witnesses can remain anonymous and thus cross-examination is defeated, (d) the trial is in camera, so protection of open trial is denied, (d) the trial does not take place in the place where the offence is supposed to have been committed (where cause of action arose) but at far away places making it difficult for lawyers; witnesses and the defence, and (f) right to appeal is to Supreme Court and within 30 days, instead of having the opportunity of moving the High Court and the Supreme Court. Besides the appeal time is 90 days normally.

### JODHPUR SPECIAL COURT

Under Sec 4 of the Act the state government can request the Central government to set up a Special Court at any place outside the state. It is under this provision that a Special Court has been made in Jodhpur inside the jail with elaborate safety measures. The trial of 379 alleged terrorists is to be held there.

The chargesheet has been submitted. The 379 persons have been chargesheeted under S 121 of the Indian Penal Code read with S 25 and 27 of the Arms Act. S 121 is the offence of waging war against the state. If a person is accused of an offence under S 121 then under the Act he will be presumed to be guilty unless he can prove his innocence. S 20 states that if a person "had been at a place in such area at a time when fire-arms or explosives were used at/from that place to attack or resist the members of any armed forces or the forces charged with the maintenance of public order acting in the discharge of their duties, it shall be presumed, unless the contrary is shown, that such person had committed such offence".

All the 379 have been given the same chargesheet. All were arrested from the Golden Temple. The advocates preparing the defence of these 379 people are up against a wall. They have not been given a list of witnesses. This makes it virtually impossible to prepare a defence. If a person was at the Golden Temple but had nothing to do with the terrorists, how is he going to prove his innocence? If the "identity and address of the witness" can be kept "secret" under S 13 (2) once again no defence can be conducted to question the authenticity of witness's statement.

Take the case of Inderjeet Kaur, she is a woman of about 35 years, a housewife and mother of four children. Inderjeet Kaur and her family live at Atta Mandi, near the Golden Temple. Inderjit and her friend Paramjeet visited the Golden Temple every morning. Just before Operation Bluestar, the BSF had set up a camp in their building. Both Inderjeet's family and Paramjeet's family gave water, sherbet and food to the BSF and as a result were threatened by extremists. On June 4, 1984 the two women got up early and as usual they started off for the Golden Temple. The BSF had become friendly and allowed them to go. Paramjeet never returned. Her husband has had no official intimation. Inderjeet sustained bullet injuries and was in hospital. Then she was at a military camp. All the time her husband was assured that she would be released. But she was transferred to Nabha jail under NSA. The grounds for arrest are cyclostyled and is identical for each person. She said the Advisory Board has not confirmed her detention but she was transferred to Jodhpur.

Meanwhile her husband has received a letter (No Teh/RR/1250-1400, December 12, 1984) from the Deputy Commissioner asking her to put in her claim for relief. This particular aspect also highlights the contradictions of official action. The fact that the government is providing Amarjeet Kaur compensation for injuries sustained at Golden Temple, for which a verification is supposed to be done by the CID, indicates that she had nothing to do with terrorists. Yet she is being tried at Jodhpur. There are other similar instances of persons who have received claims for compensation while simultaneously facing trial at Jodhpur Special Court.

What makes the official proceedings even more dubious are the 'confessions' of persons like Inderjeet Kaur, barring the change in name and other particulars, all the detenus picked up from Golden Temple were detained under NSA and served with cyclostyled grounds of arrest and confessions supposedly made by them. A copy of one such cyclostyled statement is given below:

> Stated that I am a resident of Atta Mandi, Amritsar and I am a member of All-India Sikh Students Federation and Dal Khalsa. Bhai Amrik Singh was President of these organisations. These organisations were associated with Sant Bhindranwale and we all acted according to the dictates of Sant Jarnail Singh Bhindranwale. In order to maintain the independent entity of Sikhs, our aim was to establish a separate state (Khalistan) with a separate Constitution. In order to fulfil this mission we gathered lots of arms, ammunitions, bombs and explosives from the foreign countries. So that for the achievement of the Sikh state Khalistan we should be able to strike the government. To fulfil this object six thousand persons were collected to whom arms training was imparted by retired Maj Gen Shubheg Singh. We kept our objective secret from the visitors to Darbar Sahib Amritsar and also the government. On 5-6-84 the security forces deployed around Darbar Sahib gave us warning to come out of Darbar Sahib. About 120 persons came out of Darbar Sahib on their warning. We were in groups. Due to this firing by the security forces continued upto 10-8-84. Following were the active members of our organisation.
>
> I and these persons participated vigorously. At last the security forces arrested us after entering into Darbar Sahib. Many of our workers were killed during the encounter with the army. The army seized lots of arms or ammunitions from the vicinity of Darbar Sahib. Apart from this many Pakistan army officers conspired with us and fought against the government. The government with the help of army has destroyed Durbar Sahib by firing on it and killing the Sikhs. We will vindicate this by killing four for each Sikh killed. Even if we are released, we will again collect arms and with our supporters fight for making Khalistan a separate state.

## II

On October 15, 1983, the Armed Forces (Punjab and Chandigarh) Special Powers Ordinance was promulgated. Later, in December it became an Act. Like the previous laws passed by the government to curb terrorism, this too has become a permanent part of the statute book. It is under this law that the armed forces get extraordinary powers and their acts get legal sanction.

This Act is almost a replication of the Armed Forces (Assam and Manipur) Special Powers Act, 1958. It is significant that when the earlier Act was being discussed in Parliament many members, including those belonging to the ruling party, expressed their misgivings. The then Chairman of the Rajya Sabha pointed out that once an area is declared disturbed and authority is transferred to the military to deal with the situation, "the civil authority will have no control over the situation".

Under Sections of the Act even junior officers have vast powers to search, seize and arrest people at any time of the day or night, without any warrant. Even a non-commissioned officer has power to shoot someone on mere suspicion that he may disturb public order. There is no check at all on the actions of the army and the ordinary citizen who becomes a victim of the army's arbitrary powers is left without any channel for the redressal of his or her grievances. A person whose relative is picked up by the army in the dead of the night has no way of knowing where to search for the missing person; a person whose property is looted by the army cannot recover it; a person tortured by the army has no way of getting relief through the law courts. For Section 7 of the Act lays down: "No prosecution, suit or other legal proceeding shall be instituted, except with the previous sanction of the Central government, against any person in respect of anything done or purported to be done in exercise of the powers conferred by this Act."

During the army action at the Golden Temple there were many cases of indiscriminate killing of ordinary people including unarmed women and children. The post-mortem reports state that some killed had their hands tied behind their backs. These killings include 16 sewadars of Baba Kharak Singh from gurudwara Dera Baba Sham Singh, located 50 yards from the Golden Temple. Baba Kharak Singh is an old, revered sant and a pacifist. On June 7, sixteen of his men, including 70 year-old Joginder Singh and 18 year-old Harde Singh were pulled out from the Dera, their hands tied behind the back, made to walk through the streets of Aita Mandi Bazar, and were shot dead opposite the DCM shop by BSF personnel. Soldiers belonging to the Bihar regiment and the BSF also looted the store of the Dera and decamped with things worth Rs 70,000 and half a kg of gold. This was reported to us by the granthi of the Gurudwara. The report of the looting and killing was confirmed by an eye-witness.

The sweeping powers given to the army and the scope provided therein for their misuse is indicated in the four cases given below. The first is given in some detail as it encapsulates the experience of others who have been similarly victimised.

(1) RS is a respectable citizen who following a quarrel with some of his colleagues was denounced to the authorities as a supporter of Bhindranwale. One night his house was surrounded by the army, he and his family brusquely woken up, and the house searched for weapons. When none was found, a pistol was ordered by the officers in charge to be placed under some garbage and the police accompanying the army told to recover it. Then some of the male members of the family and RS were taken away by the army. While the other family members were released the next day, RS was detained, for interrogation.

RS was blindfolded and taken to some place which he could not recognise. He was pressurised to confess that he was a follower of Bhindranwale which he refused to do, stating that he had publicly been opposed to him. The commanding officer hit him severe blows in the chest and abdomen. All day he had not been given any food to eat. When he wanted to go to toilet they bound his hands and took him out with a sten gun placed on his neck. He urinated and vomitted blood. Next day he was blindfolded and taken to an unknown place and from there to an army camp at Amritsar. For the first few days he was kept in a cell 12′ × 15′ with 28 others and then shifted to a cell of 6′ × 8′ in a barrack which had 6 people in each cell. He was kept here for 35 days. During the initial period of detention he was physically tortured every day. The normal torture entailed being hit with fists and rifle butts. Occasionally they gave him electric shocks on his soles. Every kind of humiliation was heaped on him. One day soldiers asked him to clean a room full of bidi and cigarette butts and when he refused saying as a Sikh he could not touch them he was hit in the back with a rifle butt. He fell unconscious. He also spoke about a sadistic practice at the army camp. Officers used to enter the camp at night, drunk, and threaten to cut the prisoners to pieces and choose one person from among the detenus for their night-time pleasure. The unlucky prisoner had his skin all raw at the end of the 'game' as he was flayed with a wet cane. "It was like being thrown in hell." The food was rotten and detenus ate it only because it was a question of survival. One havaldar was described as being like Amjad Khan in Sholay. He used to talk in that smooth threatening tone saying he would win more stars for what he was doing to them. RS said they saw the people arrested from the premises of the Golden Temple, but was afraid to talk to them in case they too were branded terrorists. There was a boy of eight years arrested from the Golden Temple who used to cry and was roughly treated by armymen. "I don't mind admitting that we also cried seeing him".

There was a chargesheet against RS which was withdrawn. Since no viable case could be made out against him they later charged him under Section 107 for shouting slogans against Santa Singh. The case too was quashed and he was released. He was left at night on a street in Amritsar, with broken ribs and in such a bad physical condition that he could barely stand.

RS was not given any copy of FIR and his whereabouts were not known to any relative.

(2) Parduman Singh a journalist from Hoshiarpur was detained by police and handed over to the army for eight days (FIR No 143, P S Sadar, Hoshiarpur) for publishing a report about some persons in military uniform who had looted a bus during the first phase of army operations. A young woman, Kamlesh Kumari, who had informed the journalist, and had herself lost her ear-rings, etc, too was detained under the same FIR 143 and handed over to army authorities. The woman and journalist were charged with conspiring "to overthrow the Central government by force and wanting to form Khalistan". All this was said to be on the basis of "reliable information". The advocate defending the journalist, Jaswinder Singh Parmar of Hoshiarpur, was then detained on July 16 and interrogated by the army for defending the journalist. Another advocate Kehar Singh Gill too was arrested and interrogated about matters considered confidential between advocates and clients. The army authorities obviously not only did not like anybody writing what they consider as portraying the army in an unfavourable light, but also disliked any lawyer defending persons they had chargesheeted.

(3) Gurbux Singh, s/o Teja Singh from village Khajala (district Amritsar) was picked up from Khajala on June 6, 1984. His licensed .38 revolver along with 3 cartridges of 9 mm bore were taken away. On June 18, 1984 FIR No 160/84 was registered against him at Chowk Mehta Police Station under the Arms Act, 1983. Thereafter he was sent to Amritsar army cantonment. Having been detained for two months he was handed over to police who promptly rearrested him under NSA mentioning that Gurbux Singh was arrested by the armed forces from Golden Temple while fighting against armed forces during first week of June 1984. The NSA advisory board quashed the order and he was released.

(4) In another instance, charges of sedition were filed by army for criticising army action and the accused declared absconders even when they were present in the city. Maj Gen Narinder Singh (retd), Brig Joginder Singh Dhillon (retd) and Navrang Singh were charged with sedition. In the FIR No 460/84 dated July 15, 1984 registered at PS East Chandigarh the accused were said to have made provocative speeches. The Executive Magistrate, Chandigarh, issued a proclamation on December 17, 1984 that "Joginder Singh Dhillon has absconded or is concealing himself" and demanding presence by January 30, 1985 in his court of the accused. Similar proclamations were issued against the other two co-accused. This despite the fact that all the three were present in Chandigarh at thier residences.

### TORTURE AND HARASSMENT

The most notorious case of torture and harassment is that of 92 detenus who were taken from Nabha Central Jail to Ladha Kothi between 30-8-84 and 11-1-85 and subjected to third degree methods. This sordid affair was exposed when Justice S S Sodhi, vigilence judge, sessions division at Patiala visited the Central Jail at Patiala and Nabha. During his visit the people picked up from the Golden Temple and detained under NSA complained of the tortures. Justice Sodhi directed an enquiry and the report was submitted to the Court. According to the enquiry report, between August 30, 1984 to January 11, 1985, 92 detenus were taken from Nabha jail (district Patiala) to Ladha Kothi (district Sangrur) in batches of 3-8 persons. The report says:

> Their statements reveal two common modes of torture—one is use of extra thick pestle, like mini-log which is placed on the thighs of the detenus with one or two persons standing on it. The detenu is made to lie on the floor prostrate or supine. The pestle which load thereon is then rotated over the thighs. If the position is prostrate, then the lower leg is bent over the pestle and pressed against it. Surface of the pestle being smooth and wrapped in a cloth does not cause any outward injury on the thigh.
>
> The second mode of torture which is described to be more painful consists of stretching the legs apart to an unbearable extent. The detenu is made to sit on a plain surface with one person supporting his back with his knees and pulling his long hair backwards. The legs are held at the ankle level by different persons and pulled apart. The legs on reaching a particular angle cause acute pain which on persistance result into swooning.
>
> The detenus at Ladha Kothi are not accorded the treatment due to them. They are locked up in individual cells and are kept in solitary confinement all the 24 hours except for the period when they are subjected to interrogation and torture. They are served food in the very cells and are also required to make water and ease themselves within the four corners of their cells.
>
> After going round the premises of Ladha Kothi, I got the impression that it was just an interrogation centre and it possessed least trappings of a Central Jail. There seems no jusitification for shifting small batches of detenus from Nabha jail to Ladha Kothi. The detenus stated that their shiftings from Nabha jail to Ladha Kothi were only a camouflage for taking them out from Nabha jail and to bye-pass the requirement of law to produce them before a Judicial Magistrate for being remanded to police custody for their interrogation in some new case.

In the second phase, the army was withdrawn from the villages. Hence the more recent cases of victimisation in rural areas are by the police. The police has been spreading a reign of terror by nightly visits, illegal detention and illegal attachment of property of families of wanted persons. Below we give four sample cases of families being terrorised because some male member is absconding/missing:

(1) The police have lodged FIR No 11J/84 at P S Jandiala on the basis of secret information that one Kuldip Singh is a terrorist. The man is missing but the police have arrested his father, Bachan Singh aged 70, his mother aged 60, his brother, his married sister and her two children aged 8 and 2½ years. All have been in jail since 24-2-1985. The case was to come up at Jallundhar Special Court for bail on 15-4-1985.

(2) HS is a resident of village close to Taran Taran in Amritsar district. He has three sons. His youngest son BS aged 23 years had been active in Akali agitation and led jathas. Early last year there was a case of explosion at a temple near his village. Significantly, the FIR did not mention his name. On June 23, 1984 army posted in this area came to interrogate him. Not being able to locate him they took into custody the father and his taxis were taken to the police thana. Then began a series of long periods of arrests. HS was released on June 30, rearrested with two other sons on July 25, released on August 26, taken into custody once again on September 25, to be released on September 30, rearrested on October 15 and once again released on November 3. Thereafter his sons and two nephews were

detained to be released only in mid-March 1985. BS is till absconding. All this, even though the priest in the local temple and other persons all deny any involvement of BS. The detention of these persons and the taxis and closure of their shop has ment severe economic loss for the family.

(3) CS is son of JS in district Amritsar. He is accused of being involved in a case of murder on June 4. The accused was earlier a member of the then banned AISSF. CS went into hiding. Then began a reign of terror for the family. His mother was kept in police custody for five months. She was released but the brother-in-law of the accused and a cousin were picked up and detained for 2½ months. Apart from detention the house was sealed, the goats, cows, etc, were taken away. Rice which was being harvested was taken away and auctioned ostensibly to pay for the upkeep of the animals. Yet the police demanded Rs 5,000 from the family for fodder. The 80 year-old grandmother of the boy was asked to leave the village and persons even remotely associated were threatened. The land remains uncultivated since last June and the family has left the village to escape being harassed.

(4) NS, son of BS, in village T near Amritsar. On October 5, 1984, he was arrested in connection with an incident of firing nearby. Four days later, the family members who had gone to visit the accused were told that the boy was with the DSP Bua Singh. However, the same night the police raided the house claiming that the accused had escaped. Thirteen members of the family were taken into custody, including the women. Next morning eight persons were released. But four young women of the family were kept for eight days and one of the brothers for 23 days. He was rearrested and kept for a month and another brother was also taken into detention. Since mid-March they have been free, but as a result of the more than five months' harassment, they could not sow the winter crop. It is noteworthy that not once any of the persons detained were produced before any magistrate. No warrant was ever shown. And with all this, the prisoners were even made to pay for their food.

It is such daily occurrences that upset people the most. The blatant injustice of persecuting family members of missing perons—including as it does illegal detention, torture, humiliation of women, jailing even of minors and old people, and economic hardship—cannot but alienate the people. It should be noted that according to the villagers interviewed, many young men absconded because of the occurrences of 'encounter' deaths in the districts of Amritsar and Gurdaspur. Rather than surrender and face certain death, they have fled. Others have fled because of the terror created by the police.

### CONCLUSION

The enquiry points to serious and widespread violation of the fundamental rights of the people through both the use and the misuse of the black laws enacted in Punjab. The extraordinary powers bestowed on the army, the police and courts have resulted in alienating the people, breeding resentment, and creating discontent. As the principal targets in the implementation of these laws are members of the Sikh community, this has very harmful implications given the communal situation.

Cases are piling up in the Special Courts, hundreds of people are under threat of conviction on the evidence of anonymous witnesses and corroborative evidence, and memories of humiliation and torture are being kept alive by fresh incidents.

Both urban and rural areas have felt the harsh impact of these laws. The government has in the name of stamping out terrorism passed laws which have become a permanent part of the law of the land and are applicable all over the country.

The laws have not only failed in their stated objective, but have created an atmosphere of terror among ordinary citizens. What is more, by blocking all channels of legitimate protest and dissent, they are throttling those very forces of democratic and secular opinion which can best combat communalism and help restore normalcy.

# Sri Lanka's Ethnic Conflict and Muslims

### Qadri Ismail

"ALL this time people thought that Muslims were worried only about their businesses or their estates or their paddy fields. They never thought they'll erupt. From now on, they'll have to consider us", said Halim Ishak, the sole Muslim Member of Parliament in the Opposition. He was speaking after the recent spate of violence in the east of Sri Lanka between Muslim and Tamil civilians, aided by 'external' forces, which left scores dead, more than twenty thousand homeless and damaged millions of rupees worth of property. Ishak is right on one point: hitherto, ethnic conflict in Sri Lanka has seriously flared up only between the Sinhala and Tamil communities; attempts to bring about racial harmony in the island have hitherto only looked at the problems of the Tamils (and the largely imagined grievances of the Sinhalese). But if anyone doubted that in a country increasingly cracking up along ethnic lines the other minorities would not be drawn into the fray, it has now happened. After this, Muslim thinking will have to be accommodated for the success of any solution to the national question (which some refer to as the Tamil problem). However, the equation is not as yet complete; the Indian Tamils, controlled by Thondaman, have thus far maintained as low a profile as possible—mainly because Thondaman is a member of the cabinet. Given that youth everywhere tend to get infected by radicalism, it cannot be long before the Indian Tamils, easily the most oppressed group among the Sri Lankan people, get militant too.

The Muslims of Sri Lanka, till recently referred to as the Moors, like to think of themselves as being Arab in origin. There is some truth to this belief. Islam was introduced to Sri Lanka by itinerant Arab traders; some of whom, no doubt in the stormy months that precluded voyages, married into the local community. Over the centuries, migration by Indian Muslim traders also added to Muslim presence here. Thus, the racial stock of the Muslim community in Sri Lanka is quite a mixed one. (It has also received some input from the tiny—around 43,000—Malay population here; but the Malays have proudly asserted their distinctiveness from the other Muslims. And when I use the word 'Muslim' in the rest of the article, I intend it to be synonymous with the 'Moor' of yore. That is, it does not include the Malays who have their own character and problems.)

In this connection, it is interesting to note the relevant linguistic usage. When I was in school, in the middle seventies, the community was commonly referred to as 'Moors'. The word in current parlance is 'Muslim'. Denying, that is, the community a distinctive 'racial' or ethnic identity—and giving it a purely religious one. That this is the more accurate of the two terms cannot be the reason for its employment; the Sri Lanka—or, I dare say, any other tricontinental—public is not the habit of getting its facts right in such cases. Rather, it reflects public attitudes: at a time when both the Sinhalese and the Tamils in Sri Lanka are proudly asserting their racial heritate, *pure* Aryan or Dravidian as the one may be, the drop out of use of 'Moor' indicates that, in the public eye, the Muslims in Sri Lanka form only a religious homogeniety. May I, by the way, reinforce this point anecdotally: at this year's left-opposition May Day rally, the ageing leader of the LSSP, Colvin R de Silva, used the term 'Marakkala' (the Sinhala equivalent of Moor) to describe them; while the young leader of the SLMP, Vijaya Kumaratunga, used 'Muslim'.

Geographically, as Table 1 shows, the Muslims are distributed all over the country (mainly resulting from the trading communities established by enterprising Muslims). It is commonly held myth that the Muslims are almost entirely a trading or a business community. See Table 2 for relevant statistics. While the number of Muslims engaged in trade are vastly above the national average, it can be

TABLE 1

| | Total Population | Muslim Population | Per Cent of Muslims |
|---|---|---|---|
| Sri Lanka | 14,850,001 | 1,134,556 | 7.64 |

| Ratnapura district | 796,468 | 15,441 | 1.94 |
| Kegalle district | 682,411 | 36,548 | 5.35 |

*Source:* Department of Census and Statistics, Census 1981. It should be noted that the Jaffna district was subsequently subdivided into the districts of Jaffna and Kilinochchi—done at a time when the government was optimistic that the TULF would settle for the district at the basic unit of devolution of power; this was possibly motivated by the desire to dilute the power of the Jaffna District Development Council. Also, after the killings of perhaps thousands of Tamil civilians by the Sri Lankan security forces and given the mass emigration of people from the north, the population figures for the districts of Jaffna and Mannar cannot be accurate today.

seen that the vast majority of Muslims themselves are engaged in agriculture. It is also interesting that the percentage of Muslims described as 'general farmer' is not very much below the national average. These statistics pose two interesting questions: the first, as to whether a trading community, even one with a significantly higher birth rate than the national average, could have spawned such a large agricultural community too. Whether that is, the agricultural Muslims, predominantly to be found in the east, are the result of relatively recent migrations from India—perhaps during Dutch or British rule. This may also explain why Muslims in the east are looked down upon by those in the rest of the country as being of 'lower caste'. (There does not, by the way, appear to be any reports of large-scale conversion into Islam in those parts.)

The second question relates to the community's perceptions of itself. It has always seen itself, as have the other communities, as one predominated by traders. Since Sri Lankan national perceptions have always been determined by the middle class (i e, urban) in general and the Sinhalese in particular, one reason for the continunance of this view must be that the most visible Muslim within the Sri Lankan community has always been the Muslim trader. (Popular songs have been composed with this archetype; not to mention, more recently, less complimentary strip cartoons in the Sinhala press.) But it must also be asked why the Muslims themselves haven't challenged this view.

The answer lies, I would think, in the fact that the 'leaders' of the Muslim community—that is to say, those who have achieved political power, either through the UNP or the SLFP—have tended to come, both from the west of the country and from this trading class. They have, in the main, also been uneducated; as has been the community at large.

Now one of the reasons why the Muslims as a community have not, largely, been educated—the balance was redressed only recently—has to do with the fact that education under British colonial rule, in Christian schools run generally by Christian priests, was equated by them with proselytisation. They feared that they would be converted; and in any case there was an established tradition of religious education in mosque-affiliated institutions. It was only very late in the 19th century, and then too under the inspiration of an Egyptian exile, that Muslim schools were begun. But they didn't really begin to participate in the education system until statisation of schools after independence;

TABLE 2

| | All Communities | Muslim |
|---|---|---|
| Services | 19.79 | 41.70 |
| Proprietors/ traders | (3.59) | (18.16) |
| Salesman, etc | (1.92) | (10.02) |
| Agriculture | 55.65 | 35.44 |
| General farmer | (24.33) | (21.44) |
| Manufacturing, etc | 24.56 | 22.86 |

and even then, not fully. For instance, the percentage of Muslims gaining entrance to university was just 3.8 per cent in 1977—much lower than their proportion in the population (See Table 3).

Table 4 will indicate how 'deprived' the Muslims are as a community.

Upper class Muslim hegemony over the rest of their 'bretheren' can be clearly inferred from these statistics. It also explains why they kept their bretheren generally downtrodden and uneducated. Being businessmen (and politicians—in a small community, a big businessman usually has access to important politicians and Muslims have taken care to contribute substantially to both parties that have ruled the country) making big money depended to a large extent on their access to political power. An educated younger generation would have taken away both their position and—through it—their wealth. Thus it was in their own class interest to keep their people uneducated; and, therefore, to promote the myth of their's being a business community. It is also significant that nearly half the Muslim professionals are lawyers—necessary, of course, to look after the property of the businessmen.

TABLE 4

*(Per Cent)*

| Indicator | All Communities | Muslims |
|---|---|---|
| Crude activity rate (1978/79) | 38.02 | 26.98 |
| Illiteracy (1973) | 28.95 | 34.60 |
| Unemployment (1978/79) | 14.73 | 13.81 |

| Accountants | — | 5.0 of total |
| Sl administrative service | — | 1.0 of total |
| Per capita income (1973) | Rs 326 | Rs 405 |

*Source:* Samarasinghe and Davood, "The Muslim Minority of Sri Lanka: A Business Community in Transition", ICES/Naleemiah Institute, 1984. Incidentally, with reference to the last statistic, it must be noted that the distribution of income among the Muslims is more unequal than the national average. The top 20 per cent of income receivers get 67.48 per cent of the total in the Muslim community, as opposed to the national average of 50.12 per cent. As for the bottom 40 per cent, the proportions are: for Muslims just 6.2 per cent; and all communities 16.2 per cent.

It is with these facts in mind that one has to come back to the trouble in the east. It began in the town of Karaitivu—a Tamil town, surrounded by Muslim villages—which was razed to the ground by Muslim youth on April 11 to 13, with the aid of the Special Task Force of the Sri Lankan police (popularly known as the 'Police Commandos'). An independent investigation into the events was carried out by Frank Jayasinghe, a Sinhalese and the former Principal of Kodaikanal School in Tamil Nadu. He reported that "there is *prima facie* evidence of some personnel of the STF being implicated in the incident of violence in Karaitivu". Otherwise, it would be difficult to explain how the Muslims, most of whose arms were taken away under emergency regulations, could have caused the havoc they did; especially since it is also alleged—and noted by Jayasinghe—that there was firing from the air (helicopters) and landings from the sea. It is inexplicable how the Muslims in that area (whom we have already seen to be very poor) could have suddenly acquired automatic weapons, government boats—and even helicopters!

The government has strenuously denied the possibility of the STF being involved in this—despite the fact that the Tamil Minister of Home Affairs, Devanayagam, made the same allegations. He has since been asked to keep quiet; and even Muslim MPs refuse to say the STF were involved. All this, especially in the context of other allegations another Minister, the Indian Tamil, Thondaman, refused to withdraw—about having seen five lorry-loads and two jeep-loads of (presumably Muslim) thugs being transported to the east—make the whole affair there mysteriouser and mysteriouser.

The mysteriouserness takes on a darker edge in the wake of denials by Ishak—and in private, mind you, to an opposition MP—that Muslim thugs not only from Colombo, but as it is also alleged, from the central and southern regions of the country, were transported east to continue the damage begun at Karaitivu. While it is true that in many areas of the east, members of certain militant groups, aided, ironically enough by (*albiet* Tamil) policemen, took their 'revenge' on Muslim villages, and killed those whom they identified as leaders of the Muslim attack groups, it is nevertheless also true that the majority of those now occupying refugee camps are Tamil.

The question arises as to why the government did not bring the rioting under control. "The government does not want to quell the violence", former Prime Minister and leader of the SLFP, Sirimavo Bandaranaike, told me. "They thrive on it. In the name of terrorism, they are doing a lot of things." Does this mean, then, that the whole affiar in the east was a plot hatched by the government as part of their war against the Tamils? Or was it a move by the STF to ransack certain areas they thought were militant hide-outs; and to use the Muslims to do so, given that Muslims in some parts of the east were coveting Tamil farmland and so would have been willing vassals? The Muslims, throughout the riots, relied on the forces for security cover; this they didn't always get. Several foreign journalists who visited the east reported that the, admittedly small contingents of, STF would go back to base just half an hour the curfew began—thus leaving the Muslims they were supposed to protect to the mercy of the militants, or sometimes simply Tamil civilian groups led by non-commando policemen.

There is also the theory of Israeli involvement. I spoke to Badiudin Mahmud, Minister of Education under Bandaranaike and possibly the only Muslim politician to bring tangible benefits to his community. He told me many things off the record; but one of the things he did say I could mention was this. "We have our suspicions of Mossad. They are mischief-makers and enemies of Islam. We don't know whether they are involved, but many people feel so." The suspicion is based on the fact that the STF has been trained by Israelis (presumably not from Mossad, however). The Sri Lankan Muslims are still smarting at the way they were treated when the Israeli interests section was established at the United States Embassy here. The President was then reported to have told the Treasurer of the UNP, a very senior Muslim politician, that if he—or any other Muslim—could not stomach the Israelis, they could 'get out' from the party. This led to widespread protests by Muslims in the east and in certain parts of the central province. Police dispersed one such demonstration with force, seriously injuring three Muslims, including a little boy.

But all this should not lead anyone to the conclusion that the events in the east were a sudden eruption. There have always been clearly different identities between the Muslims and the Tamils there, even if they face certain common problems due to speaking the same language, Tamil, which is not an official language of the state. For instance, there has been a history of border disputes and, more recently, a lot of extortion of both money and paddy from the Muslims—by either militants or agent provocateurs or both.

There was also the report of a killing, allegedly inside a mosque, of three Muslims in Mannar. Nobody quite knows whether this actually happened, or whether the bodies were found outside (since no militant group so far as disclaimed responsibility for this, one assumes the three were informers) and dumped in the mosque. But the government went on a huge propaganda rampage trying to show the Muslims how beastly the militants were towards them. Bandaranaike questioned this too. "Do you think the terrorists have anything to gain from shooting Muslims in mosques? If they achieve Eelam, which I hope and pray they don't, they will have to live with the Muslims. From a realistic point of view that killing does not make sense." On the other hand, the Jayasinghe report did register a fear among Muslims that in the event of a Tamil separate state coming into being, they would not have an equal share of power.

All this probably contributed to a three-day Muslim hartal in a few towns in the east, directed against the militants. In the course of this, there are reports that Muslims who had to pass through Karaitivu had their distinctive caps, which they wear all the time, pulled off their heads by Tamils and in some cases even urinated upon. And it would now appear that the STF watched all these events very carefully.

What, then, are the long-term consequences of all this for the country in general and the Muslims in particular? Currently, there is said to be a leadership vacuum in the east. And it has not helped that senior Muslim Ministers—Hameed, the Foreign Minister and Mohamed, the Minister in charge of Muslim Affairs—haven't visisted it. Indeed, Mohamed was out of the country during the entire period. Hameed, however, managed to achieve one thing: the transfer from the area of three Tamil police officers alleged to have abetted Tamil groups in their attacks against the Muslims—and so in some way placated Muslim opinion. But not enough to get the complete stoppage of a hartal call in Colombo by Muslim traders; they did heed his request to have the hartal confined to the very few areas in the business district of Colombo totally dominated by Muslims. There is reason to believe that this hartal was spearheaded by SLFP Muslim groups.

Even if the UNP Muslims are keeping a very low profile on the matter, will the SLFP ones in Colombo, coming from the same social class, spearhead Muslim agitation? A Tamil politico once told me that the Muslims not having a political organisation of their own, but 'electing' as 'leaders' those who came into power from either political party, may have good short-term consequences for the community (they would benefit, especially economically, whichever party was in power) but would be deterimental in the long run since if ever the community was threatened, there would be no group that undoubtedly represented them that could look after their interests.

But in the current circumstances, I cannot see one coming into being. What could happen is that the eastern province Muslims might unite. There is pressing need for this; and quite apart from the fact that Muslims are known to be part of militant groups, Tamil youth radicalism must infect the Muslim youth too. If this happens in the east it will, despite the current rancour against the Tamils, both civilian and militant, probably co-exist in uneasy alliance with the Tamil militant groups; especially since eastern Tamils and Muslims share common grievances. And it should be mentioned here that in the deliberations at the All Party Conference, which sought to 'solve' the national problem, the EP-dominated Council of Muslims proposed that the basic unit of devolution be the province—whereas the government, and this included the Muslim 'leaders', weren't willing to go beyond districts. This is realistic in the sense that it takes into account Tamil grievances, while not forgetting the fact that the eastern province, being more underprivileged than the north, would be in a better position to look after itself, especially given the large proportion of Muslims there.

One other thing that characterises the Muslims in the east—and distinguishes them from those in the west—is their close contact with the mosque; and therefore being quite under the influence of the priests. Given the international resurgence of Islam today, these priests now have the psychological backing of an international ideology. There is anyway a nascent fundamentalist movement, influenced by Iran, in the west; it has strong links with the east, and may even have supplied some of the Muslims there with arms.

Since the fundamentalists would be instinctively antagonistic to the upper class Muslim 'leaders', this tendency is something to be watched in the future. Once the (poor) eastern Muslims realise that their so-called leaders have in fact only led (or let) them down, we might see the birth of a militant Muslim movement in Sri Lanka. This would, inevitably, lead them to agitate for equal rights for all Sri Lankans. Today, Sinhala Buddhists are more equal than other Lankans. With the emergence of the Muslim into the political arena (and after them, the Indian Tamil can't be far behind) this could possibly change.

New from SAGE Publishers of Professional Social Sciences

**Editor: Vishal Singh**

**INTERNATIONAL STUDIES**

Founded in 1959, this journal is easily the most outstanding among Indian research journals in the field of international affairs and area studies. It carries articles on a wide range of contemporary problems as well as on interdisciplinary area studies covering South, East, South-east, and Central Asia, the Middle East, Africa, the Soviet Union, Europe, and the Americas. It is especially concerned with India's foreign policy, the theory and practice of non-alignment, the origin and growth of the non-aligned movement, and the developmental and security problems of the Third World.

**Frequency**: Quarterly in January, April, July and October

**Rates**: Institutions: Rs 180/Individuals: Rs 85

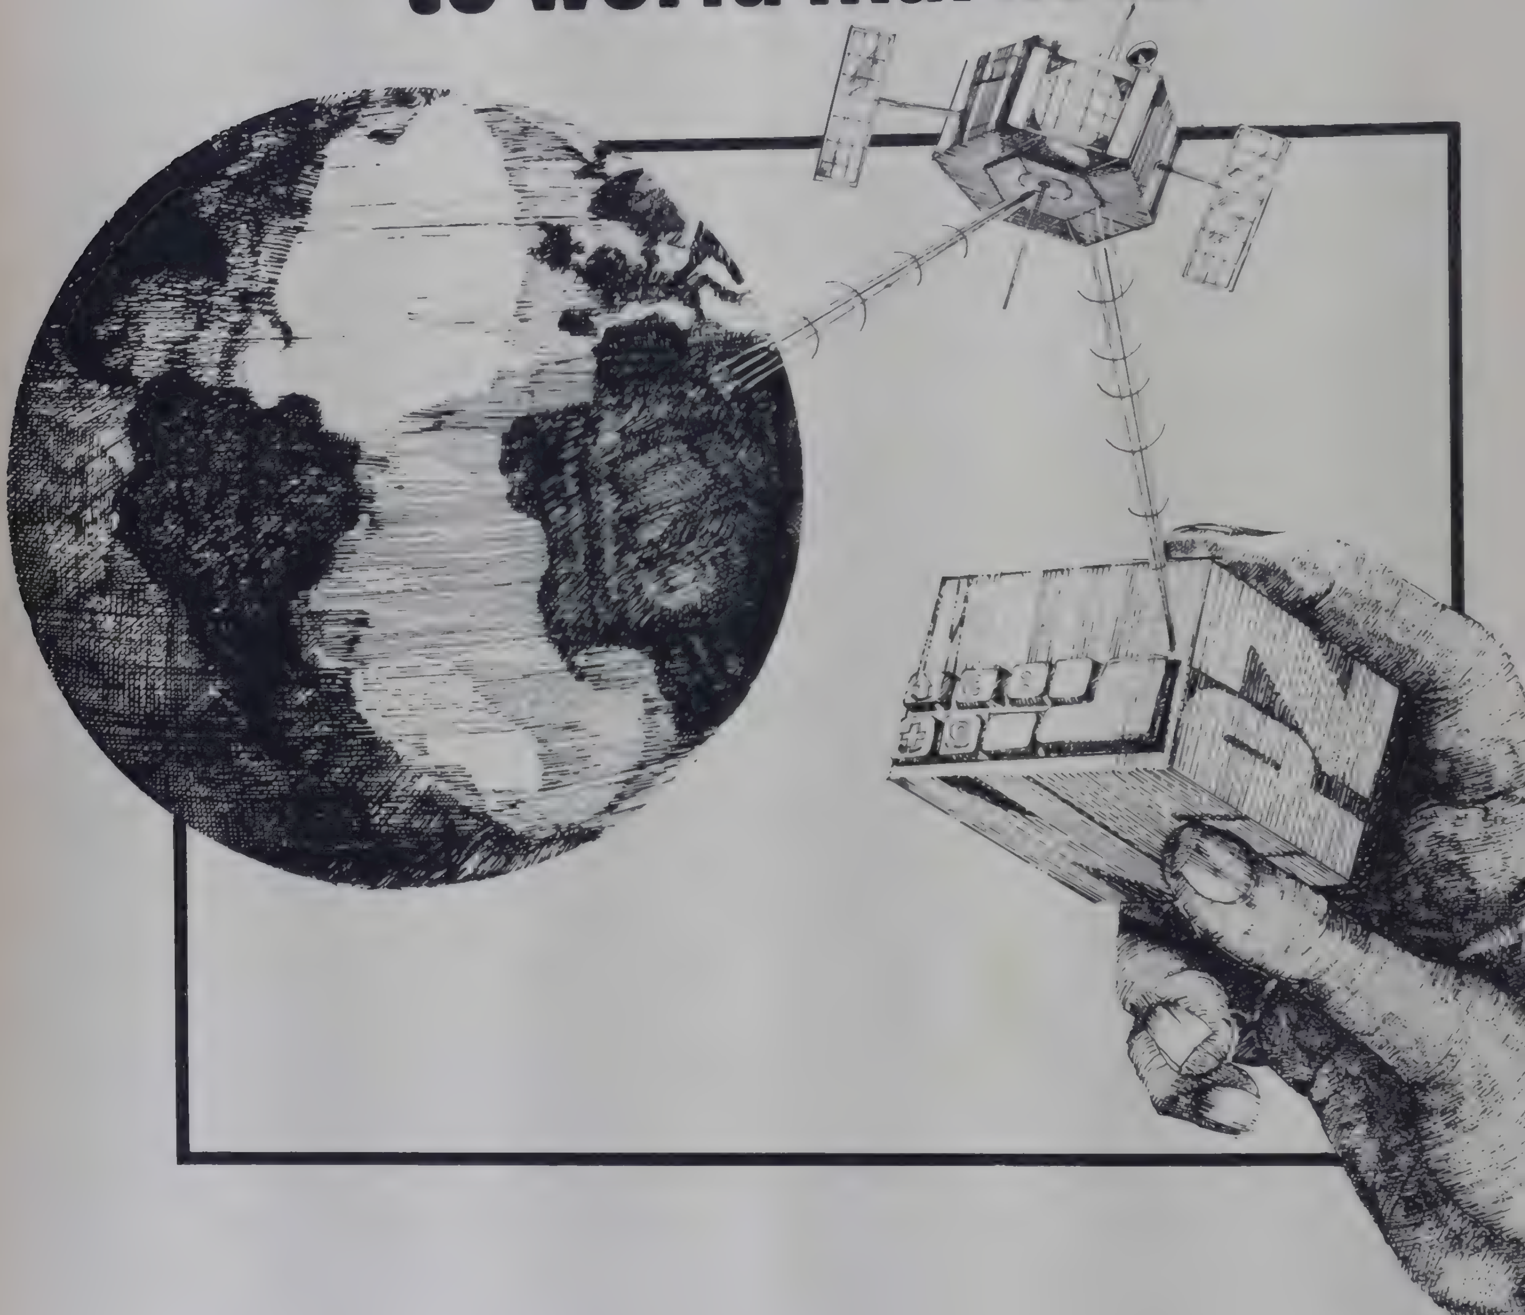
SAGE PUBLICATIONS INDIA PRIVATE LIMITED
Post box 4215 New Delhi 110048

Noida Export Processing Zone

Ministry of Commerce, Government of India

Conveniently located near Delhi
To give you instant access
to world markets.

NEPZ-8662



[illegible]ing Zone gives you the enviable ption of reaching any part of the world—in minutes!

Located right next to Delhi, the exporter can benefit rom the Capital's vast satellite telecommunication network.

Your cargo can be urgently despatched to any destination worldwide from Palam Airport, just 30 km away. Sealed vans will transport Customs-cleared cargo from the Zone to the Airport. And to the Inland Container Depot at Pragati Maidan, for carriage by rail to the seaports.

You will also gain access to everything else that New Delhi offers. The entire commercial, financial and industrial infrastructure. Government offices. An urban workforce. And Delhi's round-the-clock transport links with the rest of India.

## An exporter's paradise.

The NEPZ is a veritable exporter's paradise, offering unbeatable incentives. These include exemption from all taxes. A complete, ready-to-use infrastructure. An exclusive on-site Customs clearance office. OGL import benefits. And liberal foreign exchange release.

In short, NEPZ offers the greatest opportunity for exports of your product. Be it computer software, electronic items, leather goods, processed foods, knitwear... the list is endless.

## Lower manufacturing costs. To help you offer competitive world prices.

Since you won't pay any taxes or levies, your manufacturing costs and the prices you offer, will be drastically lower.

And you can freely import raw materials to match the world's best products in quality.

## Quick "single-window" clearance.

NEPZ promises to cut the paperwork and simplify all official procedures involved in setting up your export-manufacturing unit.

Within just 45 days of filing your application, we will obtain all clearances for you—licence, foreign collaboration MRTP, etc—to give your unit a quick, flying start. All we need is the right project.

### The Infrastructure

- Accessible location : adjacent to Noida Phase 2, distt. Ghaziabad, at the Delhi—U.P. border. Just 25 km from Connaught Place, and 15 km from Nehru Place.
- Area : 33 hectares (82 acres). Extra 200 hectares (500 acres) earmarked for expansion.
- 45 developed plots of 1500-4000 sq.m. available on 30-year lease. Built-up space from 500 to 850 sq.m. in Standard Design Factory format, on 5-year renewable lease.
- Priority telephone and telex connections. Containerized digital electronic telephone exchange hooked to Delhi Telephones by a microwave link.
- Guaranteed uninterrupted power supply.
- Large warehousing, clearing and forwarding facility.
- Containerized road movement of goods.
- NEPZ's own fully staffed Customs clearance office for spot clearance of incoming/outgoing cargo.
- Post offices, including an exclusive International P.O.
- Banks.
- Roads, drainage, street lighting.
- Police station, fire brigade.
- Housing, educational, medical and recreational facilities in nearby Noida Township.
- Industrial canteen
- Executive restaurant

### The Incentives

#### By the Government of India :

- A tax holiday for the initial 5 years.
- Exemption from basic, additional and countervailing Customs Duty.
- Exemption from import licence under OGL, for capital goods and production materials.
- Exemption from Central Excise Duty and other levies on goods made within NEPZ.
- Exemption from Export Control Order restrictions.
- Reimbursement of Central Sales Tax paid by units on purchases outside U.P.
- Special relaxation in local levies like Octroi, Sales Tax, etc.
- No restriction on foreign shareholding and repatriation of profits.
- Priority release of cement and steel.
- Permission to sell 25% of production in the domestic tariff area to valid import licence holders.
- Liberal foreign exchange release, including blanket permit for overseas visits.
- Packing credit facility for 180 days.

#### By the Government of U.P. :

- Easy availability of term loans, equity participation, underwriting of shares, bridging loans and seed capital through state corporations of the Govt. of U.P.
- Concessional power tariff, and exemption from power cuts.
- Capital subsidy to small units—including interest subsidy and margin money loans.
- Exemption from Octroi duty for 5 years.
- Subsidy for purchase of generating sets.

### The Administrative Support

- All procedures simplified.
- High level, quick decision-making infrastructure. (NEPZ Authority, the single decision-making body, headed by the Minister of State for Commerce. The Board of Approvals, headed by the Addl. Secretary, Ministry of Commerce.)
- Entrepreneurs serviced by the Zone Administration, headed by the Development Commissioner.
- Exclusive NEPZ Service Centre helps units start production in the shortest possible time, with all follow-up assistance for smooth operation.

***If you have a 100% export-oriented project, with a minimum value addition of 30%, NEPZ is just the place for you. Pollution-free projects with high tech/foreign collaboration preferred. For a detailed brochure and application form, write to :***

# Irrigation Improvement

## From Construction towards Crop Production

**Robert Wade**

**Productivity and Equity in Irrigation Systems** edited by Niranjan Pant; Ashish Publishing House, New Delhi, 1984; pp 276 + xxviii, Rs 150.

WHAT is striking about the science of irrigation is its concentration on the extreme ends of the irrigation process. A large body of literature exists on hydraulics; and another on crop-water response. The vast area in-between is, by comparison, blank. And if we look beyond the irrigation process, to crop production and income enhancement, we find that economists have written voluminously about the 'impact' of irrigation, but have been very casual about defining either the quality of that irrigation or the extent to which it has been well or poorly co-ordinated with the supply of other inputs which must also have contributed to the overall impact.

These matters are now beginning to receive much more attention, as the hard truth bears in on policy-makers and irrigation engineers that the scope for constructing big new projects is rapidly shrinking, all over Asia. Policy-makers want the existing systems to work better; and engineers want to protect their budgets, by substituting enhanced maintenance for declining construction. A dramatic re-orientation of priorities in the irrigation field is under way, from construction towards crop production, *via* maintenance and operation.

The book under review is one of the fruits of this new movement. It consists of papers presented at a conference held in 1982, at Lucknow, financed by the Ford Foundation—one of the agencies which has most vigorously promoted the new orientation. There are 13 papers in all, plus a summary by the editor.[1] All but one are about Indian systems; the exception is about Sri Lanka. Three are conceptual. Seven are case studies of individual systems (four large-scale, three small-scale farmer-operated). The final three look at the question of improving canal performance from an administrative point of view.

This is a book that irrigation-wallahs will want to read. The quality of the papers is uneven; but several are very important. Perhaps the jewel of the collection is the one on Sri Lanka, by a team from Sri Lanka's Agrarian Research and Training Institute and Cornell University. The team encompassed the skills of irrigation engineering, geography, agronomy, economics and political science, and there is no better demonstration, to my knowledge, of the ability of a multi-disciplined team of this kind, when directed at the study of a single set of problems in one particular area, to push back the frontiers of irrigation -knowledge-in-general. The team was able to make very detailed measurements of water distribution over the whole area of the Gal Oya Left Bank project—so unlike most studies, they had good data on what exactly they were trying to explain. With this baseline, they were able to correlate water supply with distance from water source, with soil type, with yields, with farmers' perception of water supply, with farmers' social response to degrees of water scarcity, and so on. For those who, like myself, have tried to do the same on their own, the work of this ARTI-Cornell team looks wonderfully sophisticated. And the research as reported in this paper is still under way. The subsequent results will be worth watching.

Another important paper is the one on 'performance monitoring' in the context of the *warabandi* system. This concentrates on the question of the actual distribution of water in one part of the Bhakra system. It is of interest both for the method used to measure water quantity supplied to different parts of the area, and for its conclusions about the pattern of distribution. Given that *warabandi* is often held up as an effective method for ensuring equity of water supply (equal amount of water per unit area, independently of location in relation to water source), the *inequality* of distribution reported in this paper is striking. It appears that if *warabandi* equalises anything, it is the *uncertainty* of water supply.

However, we remain after this and other papers in the volume no nearer to sensible criteria of what water distribution at outlet or tertiary distributory level *should* be. 'Equal water per unit of land' is not necessarily a criterion which is good for either output or equity. If, for example, 'squatters' move into an irrigation project (a phenomenon which is becoming more common as population pressure grows), it is not necessarily bad for equity or output if the existing head-enders take more water than their entitlement and channel it to squatters who are outside of the existing (perhaps partly arbitrary) boundaries. And within existing boundaries, total output may be higher if head-enders receive more water per unit of land (perhaps to grow more water-intensive crops) and tail-enders receive less, so as to save on water transmission losses. This applies whether the analysis includes or excludes risk and uncertainty. However, with risk and uncertainty, head-end farmers may attempt to take still more water than would be warranted by the above considerations, because of fear of non-arrival of future supplies (also because, they say, extra water saves on weeding labour—how effectively does water drown weeds?). If their extra water means that tail-enders get almost none, then this inequality is clearly not justified in terms of an output maximisation criterion (provided the criterion is defined as applying to a period of several years, as it must be). I may be wrong, but my impression is that economists have not got far in analysing these very important issues.

Several papers give brief accounts of farmers' water organisation, both under large-scale government canals and under small-scale systems. Only one paper is fully devoted to this subject (Patil and Kulkarni's about a system in Maharashtra), but the bits and pieces do suggest that there is much more autonomous farmer-organisation for irrigation, even under government canals, than is generally thought; but that it often varies in form, and in conditions of presence or absence, in ways not easy to understand. None of the contributors takes up the question of whether farmer-organisation might help to offset the head-tail inequality that many of the papers are concerned to describe. Nor do they address the question of whether the land market moves in such a way that head-enders tend to be bigger landowners than tail-enders. It must depend partly on the unit within which head and tail are defined. But if one is considering water distribution over a large area, involving many villages, then the prospects for redistribution towards the tail must depend not only on farmer-organisation, but also on whether the tail-enders contain big farmers who can mobilise powerful interest group pressures. How much interest group pressure does it take to offset locational advantage? The politics of water distribution is one of those in-between areas that remain, after this volume, fairly blank.

My own feeling is that the current explosion of research into the economic and social aspects of irrigation is in danger of getting stuck with too narrow a conception of the problem, which leads to a focus on water supply to the occlusion of crop production. Strategic thinking about how to improve the performance of canal agriculture needs to begin, I think, by imagining a situation in which, for each canal, the relevant governmental agencies and farmer representatives sit together and ask: what should be the objective for average yield per hectare over the whole project of the coming season? For any one target figure, it is possible to work backwards into the various tasks that *each* of the parties (e g, irrigation, agriculture, revenue, credit) must carry out, by certain times, for that target to be realisable. The final choice of target depends on what each department feels able to agree to. Regular monitoring meetings can be held throughout the season, to check performance of tasks against targets. In this kind of arrangement, the terms of reference for each department are defined in terms of *crop production*. At present, by contrast, the terms of reference of the Irrigation Department are defined only as water supply. (The papers by Hashim Ali and Turabal Hassan are interesting in this connection.) If one asks an O and M engineer about irrigated crop production he is likely to say: "Don't ask me, that's agriculture's business" This is not *necessarily* a bad thing. If a canal is designed so that there are 'break-point' reservoirs at low levels in the system, within the ken of farmers, the Irrigation Department can concentrate on delivering plugs of water to each break-point reservoir on a regular schedule, while the use of the water from the reservoir is decided by an authority of the farmers themselves and/or by another branch of government specialising in irrigation as distinct from water conveyance. But such is not the case in India. *Given* the absence of break-point reservoirs, it is then important that the irrigation engineers themselves see crop production as part of their *own* responsibility. The next question is how to translate specific agricultural requirements into water delivery targets that the engineers can feasibly aim at. I believe that economists and other social scientists could make a contribution to this question, as also to be related, and exceedingly important, question of the conditions in which break-point reservoirs make sense. The institutional and design implications are far-reaching.

### Note

1 The papers and authors are as follows: 'Introduction' (N Pant); 'Productivity and Equity in Irrigation Systems in India: Analytical and Empirical Issues' (P Rao); 'Irrigation Management: Ends, Means and Opportunities' (R Chambers); 'A Note on Monitoring Productivity and Equity in Irrigation Systems' (R Lenton); 'Performance Monitoring in the Warabandi System of Irrigation Management' (S Malhotra, S Raheja, D Seckler); 'Productivity and Equity in Gal Oya Left Bank: A Sri Lankan Irrigation System' (H Murray-Rust, N St Julien, M Svendsen, N Uphoff, M Wickramasinghe, C Wijayaratne); 'Differential Income Impact of Public Canal Irrigation in Maharashtra' (B Dhawan); 'A Study on Equity and Productivity in Periyar Vaigai Irrigation System' (V Rajagopalan, R Sivanappan); 'Productivity and Equity in Minor Irrigation Tanks' (A Sundar, P Rao); 'Performance Appraisal of Tank Irrigation System: A Micro Level Study' (C Shanmugham, R Sakthivadivel, S Savadamuthu); 'Ensuring Equity in Irrigation Systems: A Case Study of a Farmer Group Managed System' (R Patil, D Kulkarni); 'Planning and implementation of Measures to Ensure Productivity and Equity under Irrigation Systems' (Hashim Ali); 'Importance of Operation, Maintenance and Flexibility in Large Irrigation Systems' (Turabul Hassan); 'Equity in Irrigation Systems—Certain Steps in This Direction—Ukkai-Kakrapar Command Area, Gujerat' (V Sinha).

# Development Banking

**Nasser Munjee**

**Public Financial Institutions in India** by J S Uppal; Macmillan India, 1984; pp 111 + index, Rs 60.

THE story of development banking has yet to be told. India, after independence, began shaping its developmental strategy which came to depend on a breed of institutions which have, over the years, come to be known as development banks. They were designed to supplement the activities of the commercial banks in many crucial aspects. What was their *raison d'etre*? How have they developed? Should this model be replicated or disbanded?

These are some of the interesting questions to which the answer will not unfortunately be found in JS Uppal's book. As he says in the preface "the literature on financial institutions has been confined to industrial finance and industrial economics, with emphasis on accounting and financial aspects. The role of financial institutions in promoting various socio-economic objectives has not received proper attention". It is this gap that he pruports to fulfil.

The book, however, is a rather conventional discussion of the type and nature of public financial institutions as they currently exist in India together with an overall assessment of how they have met 'socio economic' objectives, especially with respect to setting up capital goods industries, achieving balanced regional growth, and helping the small-scale sector and small industries. An inordinate effort has been put into analysing the role of public financial institutions in controlling the concentration of economic power through their lending policies. Most of the data analysed has been collected from published information, especially from annual reports of all the relevant institutions. The book will appeal to all those who require a quick description of the functioning and performance of financial institutions in India. The conclusions do not produce any startling discoveries:

> *Concentration of economic power* : "Taking all the four financial institutions, we found continuation of clear preference to large and larger homes . . . the fact remains that in general, all-India financial institutions have not been able to conform to the objective of reducing concentration of economic power and discouraging monopolies."
>
> *Regional Development*: "The goals of developing backward areas and achieving a balanced regional development were not followed by public financial institutions while giving assistance during 1970-82."

The strongest feature of the book lies in its bringing together the activities and the performances of the major institutions, each treated independently without looking at the importance of the *nature* of these institutions. The loose wording and imprecise classifications can be misleading; LIC and UTI are classified as 'development banks' on page 11. We read of how Japan and West Germany, after the war achieved miracles due to the establishment of financial institutions with no mention of the Marshall Plan and Lend-lease which were perhaps the crucial primary factors in reviving activity. The book, though published in 1984, is already outdated on various issues. We read that "another disturbing feature of the capital market has been a reluctance on the part of financers to invest in debentures—an important source of capital in Western countries". This would be difficult to sustain as a description of the current activities of the capital market (share and debenture issues of Rs 605 crore in 1982 increased to Rs 1,315 crore in 1984).

Finally, the entire book is written firmly in the 'socialistic' world view. The first chapter, the weakest of the book, attempts to define the context within which public institutions will be assessed: have public institutions built a 'socialistic pattern of society'? The goals of a 'socialistic society' have been defined as follows:

> Public sector and other public policies will seek to reduce inequalities of income and

achieve a more equitable distribution through land reforms, ceiling on urban property, an appropriate tax structure and fiscal policy, channelisation of profits to the government, which will spend them for the welfare of the weaker sections, regulation of incomes of top executives in pubic enterprises and discriminatory price policies for mass consumption goods

It could well be argued that each of these goals have been the root cause of most of our problems. The Urban Land Ceiling Act has been one of the most ill-conceived pieces of legislation which has done untold harm to housing development; government expenditure policies have created waste on an appalling scale (charity with other people's money is not the best conceived system of welfare payments); regulating salaries is one certain way to keep the best talent out of the country and the administered price system has played havoc with the entire cost structure of industry.

Uppal maintains in the opening lines of his book that "Any economic system that a country adopts to achieve a socio-economic optimum is governed by such objectives as allocative efficiency, distributive equity and growth pattern". What a 'socio-economic optimum' precisely is remains a mystery. It will forever remain a dream in some planner's utopic vision.

One of the chief strategic and economic rationales for setting up a tradition of development banking is to create a set of institutions which

(1) create an area of specialisation;
(2) train and develop human resources to serve that area;
(3) raise resources and disseminate them efficiently, i e, they become efficient 'intermediaries'; and
(4) develop, guide and even instruct their clients in better ways to manage their enterprises and thereby promote efficient industrial and entrepreneurial entities.

It could be argued that while (1) and (2) have been achieved to a great extent much more work needs to be done in (3) and (4). Development banks rely heavily on one set of instruments to raise resources but have been creative to some extent in lending resources. Intermediation costs have remained high. The high and growing list of 'sick units' stresses the need to develop (4) much more strongly.

But the crucial *raison d'etre* of development banks is the creation of a specialisation. By the very virtue of their specialisation development banks build up considerable expertise and information which is of value to potential clients. Clients receive a second diagnostic opinion from an impartial critical review of projects which the client can rarely match. Further, by studying a specialised field of activity, development banks acquire an intimate knowledge of the market place—information that is of great service to governments in designing effective policies based on the realities of business.

This tradition is well developed and in my view is the strongest argument for a 'new' institution. India has learnt from its experience. The 1970s and early eighties has seen the establishment of new development banks which have extended their areas of specialisation away from industrial financing with a measure of success hard to believe. Two such banks are the EXIM bank established in 1981 and HDFC (Housing Development Finance Corporation) in 1978. Agricultural financing was also recently rationalised under NABARD. This is the success story of development banking. Uppal's conclusions would not have been so pessimistic if he had set himself a terms of reference much broader than one of subserving government's economic objectives in the narrow sense. Financial deepening will only take place with greater specialisation, many more financial institutions and instruments and a freer market. This is where success is measured and development banking has an important role to play.

# Industrial Development: Issues and Policy Options

**N S Siddharthan**

*One set of economists attribute the low growth rates of South Asia, and India in particular, to the strategy of import substitution that these economies followed in contrast to what these economists call the export-led growth strategy that the East Asian countries have followed. Thus countries like Japan and South Korea are supposed to have followed export-led growth while India followed an import substitution policy; while the former regimes liberalised externally, the Indian regime was very restrictive in the domestic as well as in the foreign sectors.*

*Facts do not , however, support these assumptions about Japan and South Korea. To start with, both these countries followed import substitution policies till recently, which enabled these countries to develop a strong industrial base and which later on enabled them to expand their exports. The rapid growth of their exports was the result of their development and not the other way round.*

*In recent months there have been signs of change in the economic policy of the Government of India. It is important, however, that the contemplated change should not aim at taking the economy even closer to the neoclassical ideal of free trade, liberalisation, free operation of market mechanism and price variables. Development consists in the production of new goods, introduction of new methods in production, creation of new markets and materials, all of which depend on non-price and non-free market variables like technological change, R and D and innovations.*

## I

## General Economic Indicators

IN the last 25 years India has made tremendous progress in mobilising the savings of its population, increasing the gross domestic investment rate of the economy and in diversifying the industrial production structure. The Indian gross domestic saving rate which was only 14 per cent in 1960 increased to 20 per cent in 1981 and is about 22 per cent at present. This rate compares very favourably with the rate enjoyed by the advanced industrialised countries. In fact with the exception of China, no other country in the world with a per capita income comparable to that of India has succeeded in achieving this rate. The Indian gross domestic investment as a percentage of national income increased from 17 per cent in 1960 to 23 per cent in 1981 and is likely to touch 25 per cent this year. The Indian mobilisation of tax revenue has also been very impressive. What is more, the high investment rate was mainly a domestic effort. Thus during 1981, the gross domestic savings excluding the net current transfers from abroad as a percentage of gross domestic investment was as high as 93.2, and including net current transfers from abroad was 99.0. Despite this impressive mobilisation effort, the share of the manufacturing sector in GDP increased from 14 per cent in 1960 to only 18 per cent in 1981. Despite 30 years of effort, around 70 per cent of the Indian labour force still remains in agriculture. Therefore, in terms of increasing the share of the manufacturing sector in the GDP the Indian performance has not been impressive. In this context, it would be worth examining the Indian performance in relation to the performance of other major Asian countries in similar fields.

Basic socio-economic indicators of eleven major Asian countries are given in the Table. These eleven countries are grouped under three heads: South Asia, East Asia and China. As seen from the Table, in addition to the geographical distance many socio-economic indicators also separate the South Asian countries from the East Asian. The Chinese performance by and large is somewhere in between these two groups. The major South Asian countries like Bangladesh, Burma, India, Sri Lanka and Pakistan are by and large much poorer than the East Asian ones like Thailand, Philippines, South Korea, Malaysia and Japan, if one goes by per capita income. The East Asian per capita income is more than double the South Asian per capita income. In addition, the annual average growth rate of the per capita income of the South Asians has been very poor compared to that of the major East Asian countries during the last 20 years. The growth rate of per capita GDP of the South Asians in general, and Indians in particular, has been less than half that of the major East Asian countries and China. The growth rates for Korea and Japan have been more than three times that of the South Asian countries and almost five times that of India. If the past trend continues, then the gap between India and its South Asian neighbours on the one hand and the East Asians and the Chinese on the other is likely to widen, and widen substantially, in the years to come. Already the differences in per capita income between India and the East Asian countries like South Korea, Malaysia and Japan is more than six times.

It is at times rightly argued that per capita GDP between countries is not strictly comparable for various valid reasons and hence it is desirable to look into certain other indicators before drawing conclusions. Cols 9 and 10 of the Table deal with adult literacy rates and life expectancy at birth, the two non-economic indicators that ought to be taken into account in inter-country comparisons. Life expectancy in particular could reflect the general well being of the population much better than a variable per capita income, as in addition to income it could also reflect certain other indicators like access to health services, water supply, nutrition and government welfare measures. Even in terms of these indicators, the East Asians appear to be definitely better off than the South Asians, with the exception of Sri Lanka. An average East Asian lives at least a decade more than a South Asian. Indian life expectancy is low even when compared to Burma, let alone Sri Lanka. An average Burmese despite being much poorer than an average Indian enjoys a higher life expectancy. An average Sri Lankan lives 17 years more than an Indian. When it comes to the literacy rate, most of the South Asians are illiterate unlike the East Asians, the exceptions being Burma and Sri Lanka. The Indian literacy rate of 36 per cent does compare very unfavourably with those of Burma (66 per cent), Sri Lanka (85 per cent), Thailand (86 per cent), Philippines (75 per cent), and South Korea (93 per cent), not to speak of Japan (99 per cent). Thus except in the case of Sri Lanka, differences in per capita income do seem to reflect fairly well the differences in the levels of development.[1]

## II

## Manufacturing Sector

During 1960, the share of manufacturing in GDP in East Asian countries was more or less similar to that in India. It was 14 per cent for India, 13 per cent for Thailand, 14 per cent for South Korea and 9 per cent for Malaysia. However, in a span of 20 years, the East Asians were able to double this ratio: Thailand to 20 per cent, South Korea to 28 per cent and Malaysia to 18 per cent, while India could increase it by only 4 percentage points, namely, to 18 per cent.

This is reflected much more sharply in the average annual growth rate of manufacturing in the last two decades. While the Indian growth rate has been around five per cent, Thailand and Malaysia experienced double the Indian rate, while South Korea enjoyed more than three times the Indian rate. When it comes to growth rate of agriculture, the Indian performance is poor compared to both South Asian and East Asian countries. For the last two decades, the average annual growth rate of agricultural output was less than 2 per cent for India, while it was more than 4 per cent for Burma, 3 per cent for Sri Lanka, around 5 per cent for Thailand and more than double that of India for Philippines and South Korea. It is worth noting that most of these countries that experienced more than double the Indian growth rate in agriculture, are rice growing countries where technological change was low. The East Asian countries also experienced certain other interesting developments which the aggregate figures given in the Table do not fully reflect. For instance, South Korea experienced no increase in inequality in income during the period of rapid growth.[2] Further, during the period 1965-75, the real wages in manufacturing and agriculture increased at annual average rates of 7.75 per cent and 4.8 per cent respectively in South Korea. Thus in the last two decades, South Asia in general and India in particular have not done well compared to East Asia. The poor Indian performance is puzzling as India has done very well in the field of resource mobilisation as seen from its high saving and investment rates.

## III

## Import Substitution Strategy

One set of economists attribute the low growth rates of South Asia and, in particular, India, to the strategy of import substitution that these economies followed in contrast to what these economists call the export-led growth strategy that the East Asian countries followed. This set includes prominent names like Anne O Krueger, at present Vice President of the World Bank, and Jagdish N Bhagwati.[3] To Bhagwati (1978) import substitution strategy could be growth reducing as the import substituting industries happen to be capital intensive. Further, import substitution uses more of direct controls as distinct from price measures. While comparing India and South Korea, Bhagwati observes that while the Indian regime consisted mainly of *don'ts* the Korean regime consisted mainly of *do's*.

To Krueger (1978), under import substitution, industry plans would be based mainly on the profitability of the sheltered domestic market and the monopoly power that accrues to those starting new production activities. Monopoly power, exercised by increasing the domestic price of the commodity above its international level, would only result in the reduction of the already small domestic market. Because of the protected environment, substandard quality and high costs would persist. All these affect growth adversely. The logical answer to the problem of a low growth rate would be to open the economy to foreign goods and investments. These authors argue that South Korea and Japan switched over to export-led growth strategy and achieved spectacular results.

The basic assumption behind these conclusions is that Japan and South Korea followed export-led growth while India followed an import substitution policy; while the former regimes liberalised externally, the Indian regime was very restrictive in the domestic as well as in the foreign sector. However, facts do not support these assumptions about Japan and South Korea. To start with, both these countries followed import substitution policies till recently, Japan till 1962 and South Korea till 1967. It was the import substitution policy that enabled these countries to develop a strong industrial base and which later on enabled them to expand thier exports. Their rapid growth of exports was the result of their development and not the other way round.

In explaining the rapid development of Japan, Ishikawa (1981) emphasised the role of 'learning effects', which mainly consisted in promoting the domestic production of goods, which would be to start

Table: Socio-Economic Indicators

| | GNP Per Capita | | Annual Average Growth Rate (Per Cent) | | | | Share of Manufacturing in GDP | | Adult Literacy 1980 | Life Expectancy at Birth 1981 |
|---|---|---|---|---|---|---|---|---|---|---|
| | Dollars 1981 | Annual Average Growth 1960-81 (Per Cent) | Agriculture | | Manufacturing | | 1960 | 1981 | | |
| | | | 1960-70 | 1970-81 | 1960-70 | 1970-81 | | | | |

*Source:* World Bank, "World Development Report". In the case of China, cols 5 and 6 refer to industry.

with of a lower quality and higher cost compared to the ones imported. Japan did follow this strategy. In later periods, however, the Japanese not only produced far superior quality goods compared to what was traded in the world market but also at a substantially lower cost. Ishikawa was also categorical in his conclusion that the competitiveness of the individual industries increased in the domestic and subsequently in the foreign markets. In this context Japan pursued protectionist policies with a relatively long gestation period.

As stated by Johnson (1982), the Japanese even during the 1950s realised the importance of large scale production and the role of scale economies to help them make a dent in the world market. To exploit scale economies they needed more customers, but they sought these customers in the potential market of Japan itself. Their exports were the result of their rapid industrial development which was in turn due to their domestic policies which resulted in the creation of institutions of high speed growth. As early as 1953, the Industrial Rationalisation Council called for the 'Keiretsu-isation' or cartelisation of trading companies and manufacturers. This meant in practice that the Ministry of International Trade and Industry would assign an enterprise to a trading company. In this way around 20 big ones were created, each serving a bank, a cartel of small producers and a full complement of companies. Enterprises Rationalisation Promotion Law (1952) provided direct governmental subsidies for experimental installation and trial operations of new machines and equipment, in addition to rapid amortisation of exemption from local taxes of all investment in research and development. It also authorised industries to depreciate the cost of installing modern equipment by 50 per cent during the first year. Further it committed the government to provide the infrastructure facilities. 'Japan external trading organisation', which is an international commercial intelligence service, was set up.

Despite its rapid industrial development and despite becoming one of the foremost leaders in technology, Japan continues to discourage imports and the entry of foreign multinational corporations. South Korea has also consistently followed a policy of discouraging multinational direct investments and imports. In this context, the conclusion of a detailed study by Westphal, Rhee and Pursell (1981) is worth reporting, namely, that Korea clearly has not had to rely on foreign entrepreneurship to identify profitable ventures to manage their operations. This had made it possible for Korea to 'unbundle' the package of resources that typically is made available by foreign direct investments, and had thus permitted the selective use of individual foreign resources. And their final conclusion that Korea's industrial competence resulted primarily from indigenous effort is important.

Japan and South Korea are two examples of countries that achieved rapid economic development which did not follow the neoclassical paradigm that is strongly advocated by the set of scholars who favour export-led growth. On the other hand, the strategy of encouraging free market operations, liberalisation, privatisation and export-led growth strategy were mainly followed by the Latin American countries in general, and Chile in particular, with disastrous consequences. The Japanese development was an anti-thesis of the neoclassical paradigm.[4] The Japanese state took the role of the main promoter of industrial development. Free play of the market forces was not allowed and imports and foreign direct investment were restricted and regulated.

## IV

## The Schumpeterian Paradigm

For an explanation of the rapid industrial development of these countries, one may have to turn to the Schumpeterian paradigm, which emphasises the role of non-price variables like skill, technology, innovation and market structures, as well as to certain non-economic variables like culture and ethos. In this paper I shall concentrate on the Schumpeterian variables rather than on the role of ethos.[5]

While the role of price variables and the importance of atomistic competition were emphasised by the neoclassical, Schumpeter emphasised the role of non-price variables, large enterprises and quasi monopolies in industrial development. Schumpeter not only considered the disappearance of atomistic competition as inevitable, a thought that he shared with Marx, he also considered perfect competition as inferior and not desirable.[6]

The policy implications of these two paradigms will differ substantially. If one went by the neoclassical paradigm, one would be advocating a policy aimed at breaking the formation of cartels, promoting atomistic competition, operating through price variables and avoiding state intervention and control. The Schumpeterian paradigm, on the other hand, would recognise size and scale advantages, will emphasise more expenditures on research and development and skill formation and will promote innovations. It will not expect the state to intervene in the market to promote a competitive structure.

Consciously or unconsciously, without being pure Schumpeterians, the Japanese seem to have followed more of the Schumpeterian principles than the neoclassical ones. They consciously followed a policy that actively encouraged the emergence of large conglomerates and forced the smaller units to join one of the large conglomerates. They tackled the problem of concentration of economic power through management reforms—abolition of hereditary Ziabatsus and holding companies. They emphasised more technology transfer, research and development and skill formation. Both Japan and South Korea aimed at and achieved very high literacy rates, 93 per cent in the case of Korea and 99 per cent for Japan. Both these countries spent a very large proportion of their national income on research and development. Their emphasis was more on a science and technology plan rather than on a plan that would fix firm targets for output of specific industrial products. They created a large number of institutions that would encourage introduction of new products, new methods, discover new sources of raw materials and markets, and they introduced changes in the market structures, all of which are considered as important constituents of economic development by Schumpeter.[7]

India, despite its policy of import substitution and planned economic development, has been much more neoclassical in actual practice than the Far East. Unlike the Far East, India did not introduce a comprehensive land reform which would genuinely give land to the tiller in agriculture, and correspondingly, hand over the management of the industrial enterprises (both in the public and private sectors) to professional managers —two preconditions for rapid development. Our emphasis on price variables, namely, profit rates, tax concessions, subsidies, differential interest rates, saving rates, etc, has been excessive to the relative neglect of non-price variables. Our effort at improving the skill content of the population has been very meagre, and as a result of this neglect the adult literacy rate even now remains at a miserably low level of 36 per cent. Our expenditures on R and D is only 0.06 per cent of the national income. Most of the direct controls, as seen from the MRTP Act, etc, derive their inspiration from the neoclassical outlook that atomistic competition is the ideal situation and conglomeration and trustification is wrong. The alternative paradigm would recognise the role of minimum economies of size, exploit size advantages, promote massive investment in R and D and would tackle the evils of concentration of economic power through land and industrial management reforms. In India, such a reform is not difficult as most of the hereditary owners of the industrial corporations are minority shareholders who control management mainly through government support. Even initial steps in these directions have not been taken. On the other hand, anti-trust laws on typical neoclassical lines have been enacted that are bound to fail in the modern corporate world.

## V

## Importance of Managerial and Organisational Reform

Rapid development resulting from innovations, introduction of new products, new methods of production, expansion of the markets and changing the structure is not possible without giving the decision-making power to those who run the enterprises, either agriculture or industry. In agriculture this is achieved through a comprehensive land reform that gives land to the tiller and in industry through organisational and managerial reform. In the case of the private sector, this would mean passing on the power from the hereditary owners to the professional managers and other staff; for the public sector this would involve the transfer for power from ministry to the enterprises. In the case of Japan the foundations of their rapid industrial development were laid soon after the war, with a comprehensive land reform that really gave land to the tillers and the abolition of the hereditary *zaipatsus* which transferred the power to the professionals.

Some of the socialist countries like Hungary, Yugoslavia and Romania have also introduced managerial and organisational reforms in their state owned organisations by transferring power from the ministries to the enterprises with very positive results. Through these managerial reforms they were able to substantially increase their productivity, make their industries competitive, successfully compete in the export markets and usher in rapid technological change, without resorting to de-nationalisation. The basic principle involved in both these cases is: transfer of power to those who run the enterprise, be it a farm, corporate unit or a public sector undertaking, from the non-cultivating landlord, non-professional hereditary owner and the ministry official respectively.

In India, we have taken very few steps in this direction in all the three cases. The public sector is dominated by the ministry officials, both directly and indirectly; directly as many of the officials in the ministry who have very little experience in or aptitude for managing an enterprise are sent as heads of these organisations and later transferred back to the ministry. The indirect control is exercised through a complex system of financial and physical regulations that virtually make it impossible for the enterprise even to take minor decisions without the consent of the ministry officials. In the case of the private sector, the power mainly rests with certain hereditary families, even though they hold only minority shares. Some of them could be professional managers, while some of them are not. In any case, the power they enjoy does not depend on their managerial ability but on their inheritence. The main casualties in this structure are enterprise, innovation and development.[8]

In recent months there are signs of change in the economic policy of the Government of India. The contemplated change should not aim at taking the economy even closer to the neoclassical ideal of free trade, liberalisation, free operation of market mechanism, privatisation of the public sector and increased emphasis on price mechanism and price variables. These were the very policies tried in the Latin American countries with disastrous consequences. As has been theoretically emphasised by Schumpeter, and demonstrated by the countries of the Far East and some of the socialist countries like Yugoslavia, Hungary and to a lesser extent by Romania, development consists in the production of new goods, introducing new methods in production, creation of new markets and materials, all of which depend on non-price and non-free market variables like technological change, R and D and innovations. The precondition for exploiting technology and to be innovative is an institutional reform: land reform in the case of agriculture and managerial reform in the case of industry. The way to development is to launch a bold institutional reform, a massive effort to substantially improve the skill content of the population by fixing and achieving physical targets for literacy, and increasing the proportion of the skilled population, and to substantially increase the expenditures on R and D. Liberalisation and non-interference of the state cannot achieve any of these objectives. On the other hand, all these are possible within our resource constraint and their implementation depends on a clear perception of issues based on an understanding of the theories of development (not the theories that help us manage existing structures, namely, neoclassical, but those that help to change the structures and create new ones), and an examination of the policies pursued by countries that have succeeded and those that have failed with disastrous consequences.

## Notes

[This paper was presented at a UGC Faculty Improvement Seminar held at Kirori Mal College, Delhi University.]

[1] Some economists attribute these differences to religion and culture, namely, Hindu in the case of India and Buddhist in the case of Sri Lanka and Burma. For instance see Sen (1982).

[2] Refer to Little (1981).

[3] Refer to Bhagwati and Desai (1970), Bhagwati (1978), Krueger (1978).

[4] Refer to Siddharthan (1984a).

[5] For works emphasising the role of ethos, refer to Morishima (1982) and Siddharthan (1984a).

[6] See Schumpeter (1943: p 106).

[7] Schumpeter (1934: reprinted 1961: p 66), for the role of Schumpeterian variables in Indian industrial performance, refer to Siddharthan (1984b).

[8] The managerial reform suggested here is not as difficult to implement as it appears at first sight. First, the hereditary owners, by and large, own only a minority of shares, and second, certain industrial houses like the Tatas, have already elevated professional managers to the position of chairman and managing director.

# 1983 Assembly Poll in Assam

## An Analysis of Its Background and Implications

**Keya Dasgupta**
**Amalendu Guha**

*In this joint paper a geographer and a historian combine to make a post-mortem of the controversial 1983 Assam elections, down to the constituency levels. With the help of maps and poll statistics which bring out the significance of the ethnicity factor in the 1983 sanguinary elections, the authors conclude that although the voter turn-out was just half of what it was in the preceding 1978 Assembly poll for the state as a whole, there was normal to high polling in 40 per cent of the 105 constituencies where elections were contested and could be completed. These normal-to-high poll constituencies are, by and large, coterminous with seven of Assam's sixteen districts.*

*The authors believe that the latest electoral rolls published recently did take care to eliminate suspected foreigners' names, as far as possible, without violating the Constitution and justice in the given tangled situation. To avoid another break-up of what is now Assam on an ethno-linguistic basis, the Assamese need for their self-preservation various guarantees other than the expulsion of pre-1971 settlers. This is one lesson that the Assamese public opinion is now increasingly adjusting itself to.*

THE purpose of this study is to assess the verdict, if any, of Assam's controversial elections which were held in February 1983, under conditions of widespread violence and obviously incompetent official arrangements of electoral facilities. Hence their credibility came under question. Though there are diverse opinions as to the validity of the elections, most people now agree that they were neither free nor fair.[1] Nevertheless, since electoral responses and conditions widely varied from region to region within the state, it is worth studying this variation and its implications. Under the given circumstances, all usual election issues lost their relevance. The only real issue forcefully brought before the electorate by the situation was that of poll boycott. The verdict given in this respect therefore needs an analysis. For, lessons drawn from it have a relevance to the constitutional requirement of drawing Assam once more into the electoral process, this time to complete the national parliamentary poll of December 1984.

The main focus of this paper is on the Brahmaputra Valley, the hot-bed of the so-called anti-foreigner agitation. At the time of the elections under review, the State of Assam had 10 districts and, of these, seven were in the Brahmaputra Valley. But, after a reorganisation, now it has 16 such districts—12 in the same Valley, two in the Barak Valley and two in the hill region. Throughout this paper, all references are to these new districts, unless otherwise stated. We propose to introduce briefly the background and immediate antecedents of the elections first, and then proceed with the analysis of their results.[2]

### I

For the last five years, Assam is in the grip of an organised mass agitation which, while having its periodic peaks and troughs, has not yet died out. Detect, disenfranchise and deport or disperse all 'foreigners'—these are the main slogans around which the agitation was built up and is still sustained by a united front of several local organisations, with the backing of the local press media.[3] The blanket term 'foreigner' includes, *inter alia*, mostly the non-Muslim displaced persons from erstwhile East Pakistan who came over to Assam in their thousands during 1951-1971 and were treated as bona fide refugees even under the Immigrants (Expulsion from Assam) Act of 1950. They are now being asked to get out, irrespective of their stage of assimilation and naturalisation, together with other foreigners.

If the agitation leaders are to be believed, then a quarter of Assam's population today, is composed of such 'foreigners' of all brands. Because of the anti-foreigner campaign rising to its peak in late 1979 and early 1980, every fourth man in Assam became a suspect and remains so in the eyes of the indigenes. This resulted in the harassment of even pre-1951 old settlers of Bengali origin, both Hindus and Muslims. They as well as the settlers of Nepali origin were subjected to frenzied foreigner-hunts from time to time. The fear of loss of national identity on the part of the majority community thus led in its turn to the fear of loss of citizenship, hearth and home on the part of the minority communities of Bengal and Nepal origin. Means adopted by the agitationists to achieve their ends were, from the very outset, both violent and non-violent. They tried to coerce minorities to join their ranks and declared that no counter-agitation by all-India political parties or by regional minority organisations would be tolerated. All-out poll boycott until settlement of the foreigner issue emerged as the major agitational plank since mid-1979, and it remains so till date. Consequently, the routine revision of the electoral rolls had remained long suspended until its recent resumption during 19 November-31 December 1984, after these were for the last time intensively revised in September 1979. The agitation continues to have several other dimensions as well, but the focus of this paper is limited only to its electoral aspects, particularly in respect of the Assam Legislative Assembly.

The Assam agitation was at its height during the critical juncture of political uncertainties and drift that came in the wake of a chain of disturbing events in quick succession in New Delhi and Dispur. After the collapse of prime minister Morarji Desai's government the next prime minister Chaudhuri Charan Singh, too, had to resign. The Sixth Lok Sabha was dissolved on 22 August 1979; fresh parliamentary elections were announced; and Charan Singh's government at the Centre continued meanwhile only as a caretaker one. The state government of Assam, too, was caught in a political crisis following the fall of Golap Borbora's Janata ministry on September 8, 1979. From this time onwards till January 14, 1980, when Indira Gandhi resumed power at the Centre, the agitationists were practically in control of Assam's administration. The police, the bureaucracy, the lower echelons of the judiciary and even the Guwahati Broadcasting Station of the AIR—all were found colluding to boost the agitation. An intensive revision of the electoral rolls on the basis of house-to-house enquiries, in preparation of the Seventh Lok Sabha poll of 1980, was indeed undertaken. But in the midst of incessant bandhs, blackouts, satyagrahas, oycotts, strikes and other obstructions, nese could be revised and finally publish- d on December 2, 1979 amid confusion nly with great difficulty. Because of road lockades, gheraos of prospective election andidates and other coercive measures dopted by the agitationists, no nomina- ons could be filed in 10 and no election ould be held in 12 of Assam's 14 parlia- entary constituencies. The government lently accepted this election fiasco as a *it accompli*, not to be disturbed by a esh electoral process. It was decided so, espite Assam's remaining largely un- presented on the body of the Seventh ok Sabha. This policy however hardly cured peace.

Upto the end of 1979, there were only few stray cases of suspected foreigners their alleged abetors being killed by sailants. But in the first week of January 980, there followed large-scale massacres settled linguistic and religious minori- es, particularly in North Kamrup, where e situation had to be brought under con- ol by calling out the army.[4] After Indira andhi had taken over, there was yet nother spell of massacres of the minori- es in the last week of May, particularly the district of Nowgong, when they ied to take their counter-agitation to the reets. Despite efforts from every quarter nce then towards finding a solution to e foreigner problem and despite long- awn bipartite and tripartite talks, no ngible solution was indeed ever in sight. ending settlement, the government anted to go ahead meanwhile with the ork of detecting at least the post-1971 reign immigrants, about whose forei- ner status there was no controversy, and en of deleting their names from the elec- ral rolls. But as the agitationists would ot listen even to this interim proposal, e government did not pursue the mat- r seriously and allowed the stalemate to ntinue.

Even as the negotiations dragged on for ree long years, the over-all situation did ot remain wholly peaceful.[5] The State ssembly having been dissolved on arch 19, 1982, the permissible span of esident's Rule in Assam was fast com- g to its end, thereby threatening to bring its wake a constitutional deadlock. me Opposition parties approved of an nendment to the Constitution at this age, so that President's Rule could be ex- nded for one more year to avoid the her alternative of going ahead with the 83 polls, then fraught with the danger large-scale inter-ethnic clashes. But they ere not prepared to extend timely assur- nce of parliamentary support that the ling party needed for the purpose. In y case, the left parties were in principle opposed to such an ad hoc measure. Under the circumstances, constitutional compulsions prevailed. The government broke off the Delhi talks rather late on January 5, 1983 and, next day, the decision for holding elections in Assam to fill up the twelve vacancies in the Lok Sabha and to reconstitute a new Legislative Assembly was announced.

The electoral process started with the validation of the 1979 rolls for the 1983 poll. The process faced mounting resistence after the talks were broken off and agitation leaders returning from the talks were arrested. The no-poll campaign, combining both violent and non-violent tactics, was emotionally surcharged, well-organised and widespread. In contrast, the pro-poll political parties failed to launch regular campaigns in most parts of the state, because of the angry and violent mood of a section of the people. Some prospective candidates even failed to submit or had to withdraw their nomination papers for the same reasons. For instance, a candidate of the Left and Democratic Alliance (LDA) withdrew his nomination after his minor son was kidnapped and held to ransom. The proposer of a Congress(I) candidate was hacked to death. Such violent incidents were many.

Nevertheless, unlike in 1980, the nominations were not numerically unimpressive. Altogether 628 nominations were filed for the 126 Assembly seats as against 1,060 in the previous Assembly poll of 1978; and of these, 527 survived rejections and withdrawals as against 938 five years before. About 9,000 government employees, including IAS trainees, were inducted—they were mostly air-lifted—from other states to run the polling machinery, as local employees had refused to co-operate; this for fear of reprisals in many cases. Draconian laws were passed and the press was gagged to control the agitation. Para-military forces were detailed heavily all over the disturbed areas. Since the ball was now in its court, the Election Commission alone could have, on its own, cancelled the election process at this stage on grounds of breakdown of normal conditions for a free and fair election. But it did not. There was outbreak of fresh spells of large-scale violence and communal clashes even before the polls took off.

Elections to 62 Assembly seats were held on February 14, to 37 on February 17, to 16 on February 20 and to 11 on February 21—all this in a staggered fashion to minimise the risks of dislocation due to outbreak of violence. Only a week before the poll started, the pro-poll opposition parties had complained of being severely handicapped in their campaigns. All motor vehicles available for hire, they said, were found either requisitioned by the government or already booked by the ruling party. Neither could they freely move in the constituencies for lack of protection. Yet they did not withdraw from the polls they had begun by then to describe as farcical. The six-party Left and Democratic Alliance (LDA)—consisting of Congress(S), CPI(M), CPI, RCPI, RSP and SUC—tried to project an alternative to the Congress(I). The Plains Tribal Council of Assam (PTCA), CPI(ML), Forward Bloc and a number of independents were also in the fray. The BJP, the Janata, and the Lok Dal, however, actively supported the call for poll boycott.

The elections, held on a war footing, got drowned in blood in many areas. Some 150 agitators died of police firing when they tried to attack polling booths, destroy bridges or cut up roads with a view to preventing voters from exercising their franchise. Agitationists led attacks on pro-poll individuals and villages and, in turn, faced retaliatory counter-attacks. Clashes, which were essentially of political nature to begin with, thus ended up largely as communal massacres—even genocide at Nellie for instance—as it had happened on a smaller scale even before in North Kamrup in the early part of January 1980. The outbursts of violence both then and later were apparently preplanned. Clandestine leaflets were in circulation in thousands, instructing people how, to act, and there is evidence of large quantities of arms and ammunitions having been piled up and put into use by the extremists. As a result, the 1983 polls could not take place on the same dates as were originally fixed, in respect of as many as 43 constituencies. In such cases polls were adjourned to subsequent dates not later than February 21.

The message of violence was carried even in the state's premier daily newspapers. On the election day of February 16, 1983 when the Brahmaputra Valley was burning, the *Daily Assam Tribune* of Guwahati, for instance, carried a significant quotation under the caption "MESSAGE FOR TODAY" on top of its editorial column. It was as follows: "The very first essential for success is a perpetually constant and regular employment of violence—Adolf Hitler". "Message for Today" appeared in the same paper and in the same place, again, on the last day of the elections, i e, on February 21, in the form of yet another quotation. This time it was from Benito Mussolini: "There is a violence that liberates, and a violence that enslaves; there is violence that is moral and a violence that is immoral"

Such messages were not missed by people those were meant for.

The guresome stories of Nellie, Gohpur, Goreswar-Khairabari, Silapathar, Chamaria and Dhula are too well known to be repeated here. According to official estimates, no less than 4,000 men, women and children—mostly of the religious and linguistic minority communities—died as a result of the organised armed attacks and arson triggered by the agitation.[6] More than three lakh people of both majority and minority communities were turned homeless and had to be given temporary shelter in government relief camps.

## II

The poll results were as could be expected under the given circumstances. In as many as 13 Assembly constituencies no poll could be held at all and in three, though partially held, the poll could not be completed. In one constituency, Biswanath, the election was countermanded as the Congress(I) candidate was killed by a group of agitators when he was addressing an election meeting. Thus, because of the fierce opposition from a major section of the electors of the Brahmaputra Valley, there was no poll in as many as 17 constituencies. In another four constituencies of the same Valley, Congress(I) candidates got themselves elected unopposed as the agitators succeeded in forcibly preventing the other candidates from filing their nominations. People had therefore opportunity to actively exercise their franchise only in the remaining 105 constituencies, representing altogether 7,302 thousand voters out of the state's 8,682 thousand strong electorate.[7]

In all, 2,385 thousand voters or 32.7 per cent of the electorate in the contested constituencies cast their votes.[8] This was an all-time record low poll in percentage terms for any state-level general elections in India (except for Nagaland). The previous state averages had ranged between 45 and 67 per cent ever since the introduction of universal adult suffrage in 1952. Yet it is of no small significance that as much as one-third of the voters, who had an opportunity to vote, were able to assert their franchise in defiance of the boycott call, backed by organised violence. In 23 of the 105 constituencies, the polling rate was above 60 per cent (Table 1).

The regional variation pattern in the voting behaviour comes out sharply when we take up constituency-wise details. In the four contiguous districts of Lakhimpur, Sibsagar, Jorhat and Dibrugarh—all in the geographical region of Upper Assam—the respective highest constituency-wise percentage polling rates were 9.6; 22.6; 13.7 and 26.1. The corresponding respective lowest percentage rates were 0.4; 1.4; 1.5 and 6.3. The district averages were accordingly, as low as 4.4 per cent; 8.6 per cent; 3.5 per cent and 16.8 per cent, respectively. In the adjoining district of Sonitpur, which is also geographically very much a part of Upper Assam, the average polling rate was as low as 24.8 per cent. Polling there could however be held only in two of its eight constituencies, Tezpur and Rangapara, where the polling rates were 10.5 per cent and 40.1 per cent, respectively. However, while the polling was very low in some parts of the state, it was high to medium in other parts.

In the central districts of Darrang and Nowgong, the comparable district average rates were 49.5 per cent and 28.0 per cent, respectively. In Darrang, the highest constituency-wise polling rate was 66.6 per cent at Dalgaon and the lowest, 26.3 per cent, at Panery. Darrang district is indeed geographically very much a part of the Lower Assam region. In Nowgong district, the highest constituency-wise polling rate was 54.4 per cent at Dhing and the lowest rate was 1.9 per cent at riot-torn Marigaon. Darrang and Nowgong saw more of poll-time communal violence in 1983 than other parts of Assam.

In terms of Assembly seats, Kamrup of Lower Assam is now the state's largest electoral district with 16 seats, and there was electoral contest in 14 of these. The district's highest and lowest constituency-wise polling rates were 50.2 per cent and 0.4 per cent—recorded respectively at Tamulpur and Dharampur. The polling average in Kamrup was 12.3 per cent,

TABLE 1: NUMBER OF CONSTITUENCIES GROUPED DISTRICT-WISE ACCORDING TO VOTING TURNOUT

| District | Average Poll Per Cent | Number of Constituences in which Per Cent of Votes Polled Was | | | | | Total Seats | | | Total |
|---|---|---|---|---|---|---|---|---|---|---|
| | | Less than 10.0 | 10.1 to 30.0 | 30.1 to 50.0 | 50.1 to 60.0 | More than 60.1 | Contested | Unopposed | Deferred | |
| Dhubri | 64.0 | — | — | 1 | 1 | 5 | 7 | — | — | 7 |
| Kokrajhar | 67.7 | — | — | — | — | 4 | 4 | — | 1 | 5 |

| Nowgong | 28.0 | 3 | 4 | 2 | 4 | — | 13 | — | 1 | 14 |
| Jorhat | 3.5 | 8 | 1 | — | — | — | 9 | — | 1 | 10 |
| Sibsagar | 8.6 | 4 | 2 | — | — | — | 6 | — | — | 6 |
| Lakhimpur | 4.4 | 6 | — | — | — | — | 6 | — | — | 6 |
| Dibrugarh | 16.8 | 2 | 7 | — | — | — | 9 | — | 3 | 12 |
| Brahmaputra Valley | 21.2 | 29 | 25 | 9 | 9 | 13 | 85 | 4 | 17 | 106 |
| North Cachar Hills | 55.9 | — | — | — | 1 | — | 1 | — | — | 1 |
| Karbi Anglong | 40.7 | — | — | 3 | 1 | — | 4 | — | — | 4 |
| Karimganj | 58.4 | — | — | — | 3 | 2 | 5 | — | — | 5 |
| Cachar | 64.5 | — | — | 1 | 1 | 8 | 10 | — | — | 10 |
| Assam | 32.7 | 29 | 25 | 13 | 15 | 23 | 105 | 4 | 17 | 126 |

*Notes:* The obvious printing mistakes in our basic statistical source have been corrected by way of internal cross-checking. There still remains a small discrepancy (of 90 votes) in the total votes polled.

* In one of these, election was countermanded.

*Source:* Same as n 2 and "Report on the General Elections to the Legislative Assemblies of Andhra Pradesh, Meghalaya, Arunachal Pradesh and Mizoram, 1978, Statistical" (Election Commission of India, New Delhi, 1978).

while in the adjacent district of Barpeta it was as high as 48.3 per cent. There the constituency-wise polling rates ranged from as high as 70.9 per cent at Baghbar to as low as 28.4 per cent at Bhawanipur wherefrom hailed the agitation's first 'martyr' as far back as in December 1979.

Coming to the other districts of Lower Assam, one finds the average polling rates to be respecitvley 64.0 per cent and 67.7 per cent in Dhubri and Kokrajhar districts, but only a low 38.7 per cent in Goalpara district. The constituency-wise polling rates ranged from 44.4 per cent at Bilasipara-East to 79.4 per cent at Mankachar in Dhubri district and from 62.6 per cent in Sidli (ST) to 73.4 per cent in Kokrajhar-West (ST) in Kokrajhar district. However in Goalpara the poll rates ranged between two extreme poles—13.4 per cent at Dudhnoi (ST) and 65.7 per cent at Jaleswar. The last-mentioned constituency bordered on the Dhubri district.

In the hill district of Karbi Anglong, which enjoys a measure of autonomy under the Sixth Schedule of our Constitution, the average polling rate was 40.7 per cent, while the actual polling rates of its four constituencies ranged between 30.8 per cent and 51.7 per cent. In the other hill district under the Sixth Schedule, the North Cachar Hills, which had only one constituency, the polling rate was 55.9 per cent. In the two districts of the Barak Valley, i e, Cachar and Karimganj, the respective average polling rates were 64.5 per cent and 58.4 per cent as against 59.7 per cent and 61.4 per cent of the comparable 1978 poll. The constituency-wise polling rates in these two districts ranged from the highest 75.6 per cent at Sonai to the lowest 46.9 per cent at Dholai (SC). Cachar is the state's only district where, in fact, an increase in the average polling percentage over the last Assembly elections was recorded.

Because of the abnormal political situation, polling was in general depressed, as compared to 1978, all over the state barring the Barak Valley. In fact, with the exception of a lone constituency (South Salmara) in Dhubri and another (Baghbar) in Barpeta, every where else outside the two Barak Valley districts the constituency-wise polling rate was lower than what it was in 1978. Even in the latter two districts, five out of their 15 constituencies recorded lower rates. However, the decrease there was small and it had nothing to do with any anti-poll agitation. As can be seen from our constituency-wise detailed statistical analysis produced elsewhere (Occasional Paper No 72; CSSSC, Calcutta, 1985), the polling rate was below 50 per cent in as many as 67 constituencies of Assam in 1983, as against only one in 1978; and below 45 per cent in as many as 63, as against none in 1978 (see Fig 1).

The average polling rate for the state which was 66.9 per cent in 1978 came down to slightly less than half of it in 1983, i e, to 32.7 per cent. The polling rate in any individual constituency never exceeded 85 per cent in Assam, whether in 1983 or in any previous election. For instance, the highest such rate was 79.4 per cent in 1983 as against 83.4 per cent in 1978. So, if 85 per cent polling was the maximum realisable for a constituency or even for the state electorate as a whole under any circumstances—in fact, either average had always been much lower than this—and given the normal level of voters' apathy, the divide to determine whether a majority of the active voters in a constituency had voted or not could then be set at half this realisable ceiling, i e, at 42.5 per cent. To be on the safer side, we propose to take a higher figure, i e, 45 per cent, as this divide to cut off high poll areas from the rest.

Altogether 42 constituencies in 1983, on this criterion, constituted the high poll area. In 23 of them polling was above 60 per cent and in 19 it varied from 46 per cent to 60 per cent. Constituencies voting from less than one to 30 per cent may be called low poll areas. Altogether 54 such constituencies were there. In 21 of them polling was upto five per cent and no more; in 19 from above five to 15 per cent and in 14 from 15 per cent to 30 per cent. Finally, constituencies within the voting range of 30 per cent plus to 45 per cent, numbering nine may be called medium poll areas under the given abnormal circumstances. This three-fold classification into high, low and medium poll zones may be somewhat arbitrary but, as we shall see soon, it helps encapsulate the situation neatly and intelligibly on a map (Fig 1). In this classification, we could have as well used the word 'normal' for 'high'.

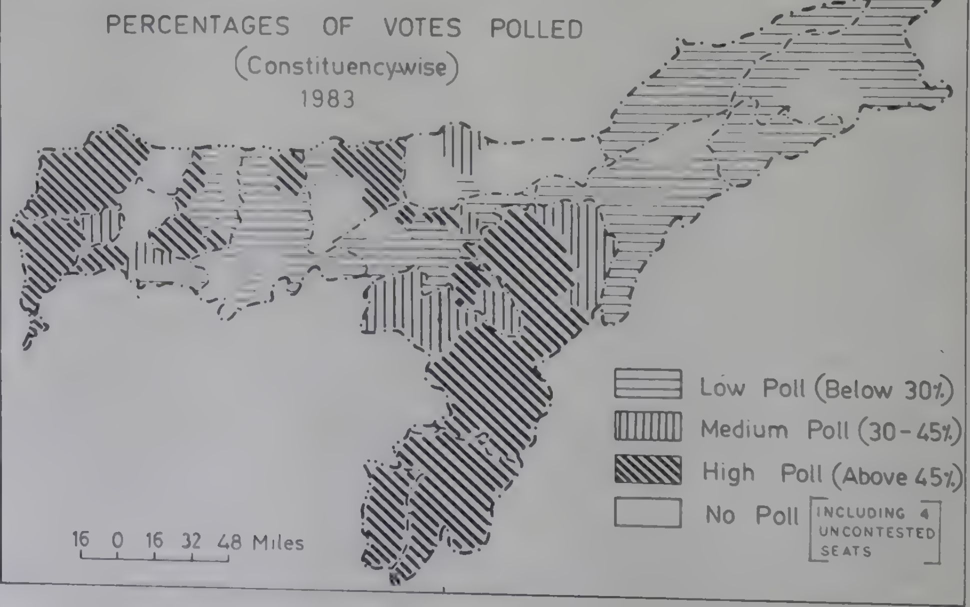
The constituencies classified into three zones—high, low and medium—do not, however, form as many compact areas when shown on the map. Nor are they formed of whole districts or subdivisions as such. Nevertheless, these zones reflect more precisely the regional voting patterns which have already emerged from our preliminary district-level approach. One or two constituencies here and there, however, break the contiguity or compactness of an otherwise uniform area. Besides, the 21 (17 + 4) no-poll constituencies also clumsily intervene and interfere with our classification.

In the high poll zone, as defined, are included the districts of Cachar, Karimganj, North Cachar Hills and Kokrajhar. So are half of Karbi Anglong district, covering the two constituencies of Howraghat (ST) and Diphu (ST) and the whole Dhubri district with the exception of one constituency, Bilasipara-East. Jaleswar and Goalpara-West of Goalpara district; Sorbhog, Jania, Baghbar and Chenga of Barpeta district; Tamulpur of Kamrup district; Dalgaon, Udalguri and Majbat of Darrang district; and Dhing, Rupahihat, Jamunamukh and Hojai of Nowgong district—these 14 scattered constituencies as belong to the high poll zone.

On the other hand, the low poll zone included the four contiguous districts of Lakhimpur, Sibsagar, Jorhat and Dibrugarh as well as the Tezpur constituency of Sonitpur district—all in Upper Assam. The whole of Kamrup district with the exception of Tamulpur (polling 50.2 per

FIGURE 1

PERCENTAGES OF VOTES POLLED (Constituency-wise) 1983



cent) and its two no-poll constituencies; Jagi Road (SC), Marigaon, Batadrava, Nowgong, Barhampur and Kaliabor—these six constituencies of Nowgong district; Bhabanipur constituency of Barpeta district; Panery of Darrang and Dudhnoi (ST) of Goalpara district—all these were also included in the same. Altogether, as said, there were 54 low poll constituencies.

The 21 no-poll constituencies—six in Sonitpur, three each in Darrang, Goalpara and Dibrugarh, two in Kamrup and one each in Kokrajhar, Jorhat, Barpeta and Nowgong districts—these were *terra incognito*. Nothing can be said of their voting behaviour, unless the forced vacuum in these constituencies be interpreted as sign of their negative political will rather than as a measure of the striking power of some organised sections of the relevant constituencies. In any case, they were hardly expected to yield high poll even if they were exposed to voting, given their mixed social compositions and disturbed conditions. This will soon be explained.

Finally, the nine constituencies of the medium poll zone included Rangapara of Sonitpur, Samaguri and Lumding of Nowgong district; Bilasipara-East of Dhubri; Goalpara-East of Goalpara; Barpeta and Sarukhetri of Barpeta district; and Bokajan (ST) and Baithalangso (ST) of Karbi Anglong. The medium poll areas were relatively scattered as compared to the areas of high and low poll zones.

Before we pass to the next section to correlate the voting behaviour to ethno-demographic factors, let us examine the question of rigging, which was complained of and was not impossible under the given circumstances. In the face of fierce resistance, many polling stations had to be shifted at short notice; there was chaos and confusion all round. Even booths set up hardly functioned on time. Scores of ballot boxes went empty. Under such circumstances, and given the large-scale absenteeism on the part of candidates' polling agents, authorities were said to have manipulated votes. This was the nature of the alleged rigging in the highly disturbed areas, where public vigilence was made impossible by the situation and where voting in any case remained extremely low. In one case, the LDA candidate failed to get a single vote—even that of his own—as he could not locate his own polling station in the Dharampur constituency. The particular station perhaps existed only on paper or was a mobile one. In as many as five cases, respective candidates of both ruling and opposition parties could get themselves elected because somehow each of them could altogether mobilise from 266 to 700 votes. In low and medium poll zones even hard-core party cadres were too obviously afraid to turn up to cast their votes. Rigging, if any, however, could not have in any case compensated the pro-poll parties for the total votes they lost in the process.

So far as the high poll zone is concerned, rigging was not necessary at all for returning the ruling party candidates, given the panic-stricken swing of the minorities in its favour under the prevailing conditions of the anti-foreigner agitation. Also, since our purpose is to assess regional variations in the response to the poll boycott, rather than to the party-wise distribution of votes as such, the question has little relevance to our anlaysis. There does not seem to be any reason to believe that the inter-regional variations within the state were affected by any factor such as 'rigging' distinguishable from the general situation of abnormality.

TABLE 2

| District | Total Voters | Number of Voters in Active Constituencies | Votes Polled | Per Cent Votes Polled | | Total Population | Per Cent of Religion | | Per Cent of Scheduled Tribes | Per Cent of Speaking | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | 1983 | 1978 | | Hindu | Muslim | | Assamese | Bengali | Other Languages |
| | | 1983 | | | | | | | 1971 | | | |
| 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 |

## III

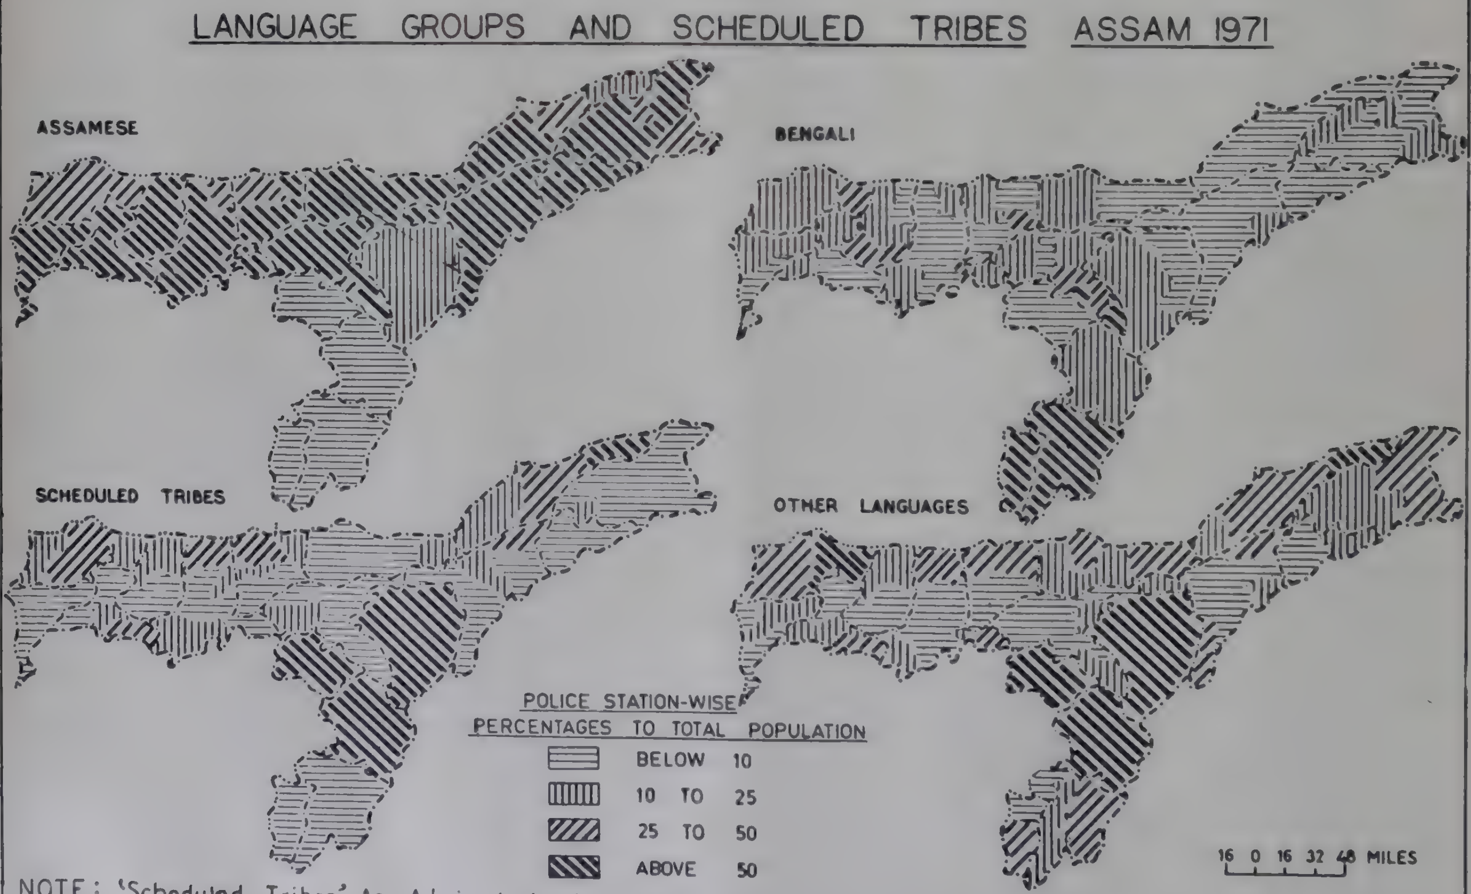
We shall now make an attempt to explain the regional peculiarities of the voting behaviour with reference to religion, language and tribal/non-tribal identity—the three variables which had considerable influence on it. In 1983, in particular, these community ties played obviously an unusually larger role in Assam. But before we do so, let us first look into their respective magnitudes in the population of the state as such and its several districts (Table 2). Fig 2 shows the distribution of languages and the scheduled tribes police station-wise. Religion-wise population data are available for the old census districts only, as these districts were constituted from time to time upto 1971, and not for units below this level. So for the new districts, as such, no religion-wise distribution of population can be shown.

In the census of 1971 (the last one for Assam till date), the Hindus accounted for 72.5 per cent and Muslims 24.6 per cent of the state's total population. These percentages were, more or less, the same also in the censuses of 1951 and 1961. The proportion of Muslims in the combined population of the districts of Dhubri, Kokrajhar and Goalpara was 42.9 per cent in 1951; 43.3 per cent in 1961 and 42.3 per cent in 1971. In Cachar and Karimganj districts taken together, the corresponding figures were 38.5 per cent, 39.2 per cent and 39.9 per cent, respectively. This proportion of Muslims remained, more or less, steady around 29 per cent in the combined population of Kamrup and Barpeta, and at 40-41 per cent in Nowgong over all these census years. In the old district of Darrang (inclusive of Sonitpur), this proportion first rose from 17 per cent in 1951 to 19.4 per cent in 1961 and then came down to 16.2 per cent in 1971. It was negligible in every other district; in the four Upper Assam districts of Lakhimpur, Sibsagar, Jorhat and Dibrugarh, taken together, no more than five per cent and in the two hill districts still less. Over the three decades ending 1971, the proportion of the Muslims in the population, both at the state and district levels, thus tended to fall slightly while that of the Hindus tended to rise.

Like the distribution of religion, that of language, too, is interesting. As per the 1971 census, people with Assamese as mothertongue accounted for 61 per cent, Bengali-speakers for 20 per cent, Hindi-speakers for 5.4 per cent and speakers of indigenous tribal languages for about 8 per cent of the state's population. These percentages were not much different from those prevailing in 1951 and 1961, the variations being limited within one per cent range. For instance, Assamese-speakers' ratio to the state's population constituted 62 per cent and Bengali-speakers' 21 per cent in 1951. Languages, however, were not evenly distributed over the state. Concentrated almost entirely within the 12 districts of Brahmaputra Valley and accounting for about 71 per cent of its population, Assamese-speakers remained—as it still remains—the dominant linguistic community not only there as a whole but also in each of its districts throughout 1951-71. In 1971 the ratio of Assamese-speakers to district population ranged in this valley from the lowest, 61.2 per cent, in Lakhimpur to the highest, 87.9 per cent, in the new district of Sibsagar. Compared to Assamese language, Bengali had a wider distribution. Half of the state's Bengali-speakers lived in different districts of the Brahmaputra Valley and accounted for 12 per cent of its population. The other half, concentrated in the Barak Valley, accounted for 77.7 per cent of its population as against 0.5 per cent accounted for by Assamese-speakers.

These two distinct linguistic regions

FIGURE 2



LANGUAGE GROUPS AND SCHEDULED TRIBES ASSAM 1971

NOTE: 'Scheduled Tribes' As Administratively Defined Irrespective Of Language Spoken apart, there is a third linguistic region—the twin hill districts of North Cachar Hills and Karbi Anglong—where their own tribal languages dominate. Assamese and Bengali-speakers together accounted for only 22.4 per cent of this region's population in 1971. Assamese accounted for 13.6 per cent in Karbi Anglong and only 2.8 per cent in North Cachar Hills; while Bengali accounted for 9.7 per cent in the former and for 14.4 per cent of the total population in the latter district.

Our third variable, is caste and tribal solidarity. In 1971 scheduled castes constituted only 6.4 per cent of the state's population, and caste feelings as such have generally always remained on a low key as compared to other states. For some years preceding the agitation, Assam was indeed under the shadow of caste politics in a novel way. People of intermediate castes, labelled as Other Backward Classes or Communities (OBC), successfully combined on various political platforms to oust higher caste Hindus, such as Brahman, Kayastha and Kalita, from their niches of power. Data on different non-scheduled castes are not severally available for any census year after 1931. Besides, the division between the OBC and the higher castes ceased to be a factor after the phenomenal rise of the anti-foreigner united front, well until the 1983 poll. So the caste factor may be overlooked, but not the tribal factor for purposes of our analysis. The scheduled tribes accounted for almost 11 per cent of the state's population in 1971 concentrated in the districts of North Cachar Hills, Karbi Anglong, Lakhimpur and Kokrajhar. There they constituted 69.1 per cent, 55.4 per cent, 28.8 per cent, and 28.7 per cent of the corresponding relevant populations. While fully sharing the anti-foreigner sentiments, the tribal populace was divided on the question of giving support to the agitationists' anti-poll stand. Since they suffered from the fear of being culturally swamped also by the non-tribal Assamese, they remained lukewarm towards the call of the AASU and its allies.

The above ethno-demographic profile needs some further clarification. Large-scale migrations from time to time in the past were responsible for its heterogeneity. Historically it is observed that both autochthonous (tribal) and migrant linguistic groups gravitated over the centuries towards the Assamese (Asamiya) language and tended to adopt it in due course. This Asamiyaisation process is still active resulting in a very fast—indeed fantastically high—rate of growth of the Assamese-speaking population over the last half-century.[9] Linguistic converts of tribal and migrant origin of this period, most of whom still continue to be bilingual, thus account for a sizeable proportion of the censused Assamese-speakers and complicate the situation. Muslims of East Bengal origin predominate among these linguistic converts in the central district of Nowgong, as well as, in Lower Assam. Non-Muslims of immigrant tea labour origin and Ahoms predominate, on the other hand, among the linguistic converts in Upper Assam.

On the foreigner issue, it is likely that no neo-Assamese of Bengali or Nepali origin share the fear complex of the autochthonous Assamese; on the contrary, they may even have sympathy for the post-1951 immigrants of their own respective ethnic stocks. The neo-Assamese linguistic converts from tea labour communities, on the other hand, are likely to be, by and large, somewhat indifferent to or at least less involved in the whole question. In any case, they have generally remained aloof from the action programme of the agitation, though not explicitly opposed to it. Bengali Hindu refugees and Nepali settlers have generally retained their languages, but not all of them. On the whole, a considerable number of them, Muslim immigrants from East Bengal in general and about half of the plains tribals of the Brahmaputra Valley appear to have firmly adopted Assamese as their first language. So have the indigenous Rajbhansi community of Lower Assam who used to be generally returned as Bengali-speaking in the old district of Goalpara upto 1931. In Assam they are recognised as a 'backward community' today, whereas in West Bengal they are a scheduled caste and their mothertongue is returned as Bengali.

While analysing the poll performance within the above demographic profile, some limitations are to be faced. The 1971 census data on religion are not available below the then district level. Secondly, the speakers of a particular language as such were not cross-classified in any census in terms of religion, nor were the adherents to a religion as such also noted language-wise. Hence in the absence of such cross-classifications, it is not possible to ascertain what percentage of the Assamese-speaking population were Muslim by faith or what percentage of the Muslim populace were Assamese-speaking. How many were Assamese-speaking by origin and how many by choice cannot also be ascertained. Data on languages and tribal identity are available downward upto the police station level. There were 127 police stations (*Thana*) in Assam on March 31, 1978 covering its 126 constituencies. But there were only 103 such police stations at the time of the 1971 census, as against the same 126 constituencies. Since police stations and constituencies were found to be coterminous by and large in most cases, their data can be correlated for our purpose. In some cases, however, the constituency involved more than one police station; or a police station, more than one constituency. To that extent, our laboured exercise to establish correlation may be somewhat deficient, but the margin of such deficiency in any case remains insignificant.

By super-imposing the map showing the constituencies upon the map showing the thana areas—both drawn to the same sacle—one could always check the extent of their coincidence. Having pointed out our methodological shortcomings, we shall now explain, with a reference to the three chosen variables, why in certain areas poll performance was high and in others low or medium in 1983. In that poll year, community considerations predominated.

### HIGH POLL ZONE

On the map (Fig 1), five separate contiguous blocs represent the high poll zone. The biggest of them, consisting of 20 constituencies, covers the whole of the districts of Cachar, Karimganj and North Cachar Hills; and it also includes the two constituencies—Jamunamukh and Hojai—of Nowgong and another two—Howraghat (ST) and Diphu (ST)—of Karbi Anglong Districts. In Cachar and Karimganj taken together, the ratios of both Bengali-speakers (77.7 per cent) and Muslims (39.9 per cent) to the total population were high, and this fact sufficiently explains the voting behaviour in this region. The ratios of Assamese-speakers (0.5 per cent) and scheduled tribes (0.89 per cent) were too small there to have had a significant bearing on the poll. In the North Cachar Hills, the tribal factor (79.1 per cent) was undoubtedly the deciding factor. The tribals were somewhat influenced there by the agitation, as was obvious from newspaper reports, but not to the extent of sizeably lowering the district's polling rate (in 1978, 64.2 per cent voted; in 1983, 56 per cent) to keep it out of the high poll zone. The fact that the Bengali-speakers had a higher ratio (14.4 per cent) to the population there than the Assamese-speakers (2.8 per cent) only partly explains the high poll. Its main explanation has to be sought in the poll participation of the tribal voters themselves.

In the case of Karbi Anglong, the agitation had relatively greater impact than in the North Cachar Hills—partly because the Assamese-speakers outnumbered the Bengali-speakers there and the ratio of the tribal to total population was also relatively lower. The latter, for instance, was 43.4 per cent in Howraghat and 55.5 per cent in Diphu. The polling rate dropped from 67.4 per cent in 1978 to 46.9 per cent in 1983 in Howraghat (ST) and from 60.7 per cent to 51.7 per cent in Diphu. What is obvious from these facts is that the drop in the two constituencies under review here was not enough to keep them outside the high poll zone. In the district's other two constituencies, polling was of medium, rather than of low range.

Coming to Jamunamukh and Hojai of Nowgong district, we find that their polling rates dropped from 66.2 per cent in 1978 to 50.5 per cent in 1983 in the first case and from 69.3 per cent to 50.1 per cent in the second case. These two constituencies did not exactly coincide with the police stations of the same names. Jamunamukh included not only the whole area under the Thana of the same name, but also that under neighbouring Murajhar Thana as well as a portion under Kampur Thana. Hojai constituency included the whole area under Hojai Thana and one-third area of Lanka Thana. To explain the relevant voting behaviour, let us therefore have a look at the linguistic composition of the population in the above-mentioned police station areas, given the knowledge that the share of the scheduled tribe population in these was insignificant.

From Table 3 it is apparent that Bengali-speakers' concentrations were significantly large in the two constituencies under review here. Besides, sizeable sections of the Assamese-speakers, too, were neo-Assamese—mostly immigrants of Bengali Muslim origin. Hence, both communities could together ensure a high poll.

The Lumding constituency, consisting of 66.7 per cent Bengali-speaking Lumding Thana and two-thirds of 30.9 per cent Bengali-speaking Lanka Thana, polled only 41.2 per cent. This is surprising. Assamese-speakers had a low 15.8 per cent share in the population of Lumding Thana (where the constituency's electors were mostly concentrated); besides the scheduled tribes' share there was also as low as 1.1 per cent. Why then, despite its Bengali-majority character and despite its electing once more a Bengali Hindu candidate (Congress(I) won in place of the LDA), did the polling rate in Lumding constituency go down so sharply from 60.5 per cent in 1978 to 41.2 per cent in 1983? The drop was, perhaps, partly due to voters' different behaviour in the constituency's less-Bengali Lanka Thana portion and partly due to the specific law and order situation.

The high poll zone's second largest bloc, consisting of 12 constituencies, included the whole of Dhubri district excepting Bilasipara-East, the whole of Kokrajhar district excepting Bijni, where no poll could be held, and only two constituencies —Jaleswar and Goalpara-West—of Goalpara district. Muslims, who formed 42 per cent of the combined population of these three districts in 1971, had apparently a still larger share within this 12-constituency bloc, possibly accounting for a majority of the Assamese-speakers and even of the total population. Besides, Bengali-speakers had their sizeable concentrations in this bloc. So had the scheduled tribes in the Kokrajhar district portion of the bloc. Bengali-speakers' share was 18.4 per cent and scheduled tribes' 28 per cent in the population of Kokrajhar district. All these factors explain the high poll, ranging from 59.5 to 79.4 per cent there, even in the face of determined opposition of the local Rajbansi community and other Assamese-speaking indigenes.

The voting behaviour in the three above-mentioned districts, which earlier formed a single district, needs a little more clarification on a couple of points. The tribal political behaviour was not uniformly pro-poll. It was very much so north of the Brahmaputra, particularly in Korajhar district so located. But it was quite opposite in areas south of the river. In fact, this north-south difference in tribal attitude could be generalised for the whole of the Brahmaputra Valley, excepting for the district of Lakhimpur. The reason may be sought in the differences in the degree of their Asamiyaisation. North of the Brahmaputra, the plains tribals have, more or less, successfully retained their own languages, and they are much under the influence of the separatist movement of the PTCA. But, south of the river, they are increasingly adopting Assamese as their language, or have already done so, as in the case of the Lalungs of Nowgong, or the Rabhas of Goalpara.

TABLE 3: LANGUAGE-WISE PERCENTAGE SHARES IN THANA POPULATION: 1971

| Thana | Assamese Speakers | Bengali Speakers | Speakers of Other Languages |
|---|---|---|---|
| Jamunamukh | 64.5 | 26.8 | 8.7 |
| Murajhar | 62.5 | 33.4 | 4.1 |
| Hojai | 28.8 | 50.4 | 20.8 |
| Lanka | 57.5 | 30.9 | 11.6 |
| Kampur | 68.8 | 25.8 | 5.4 |

*Source:* Census of India, 1971, Series 3, Assam, Part 2c (ii), Social and Cultural Tables.

Secondly, not all Assamese Muslims were or are immigrants. Even as early as in 1881, when immigration had not yet started from eastern Bengal towards the Brahmaputra Valley, they constituted a quarter of the combined population of the present districts of Dhubri, Kokrajhar and Goalpara and spoke the same district dialect in common with the local Hindu Rajbhansis. Even as far back as in the 1809, Francis Buchanan Hamilton estimated their share in the local population at 23 per cent.[10] It was only after incessant immigration during the first half of the 20th century that the share of Muslims rose to the present 42 per cent by 1951 and that of the Hindu Rajbhansis came down from a quarter or so to much less than that. And no census data are available on castes after 1931, the latter's exact number or their percentage share in the population now is difficult to estimate. As a community, the Rajbhansis were and still are deeply involved in the anti-foreigner movement.

The high poll zone's third largest bloc, with its constituency-wise polling rates ranging from 47.6 to 66.5 per cent, consisted of five constituencies. These were Udalguri-ST (covering about half of the Paneri Thana area and one-third of Udalguri Thana area), Dalgaon and Majbat of Darrang district—all north of the Brahmaputra; and Dhing and Rupahihat of Nowgong district, south of it. Assamese-speakers were a minority in the first, but a majority in the remaining four. Related Thana-level data suggest what favoured the high poll. It was mainly the neo-Assamese Muslim factor in Dalgaon, Dhing and Rupahihat; it was the tribal factor in the case of Udalguri (ST); and the heterogeneous plantation labour community in the case of Majbat. The sizeable presence of Bengali-speakers—e g, 31.2 per cent in Dalgaon and 18.8 per cent in Rupahihat Thanas—was also favourable to high polling in the related constituencies.

The high poll zone's fourth largest bloc, where the constituency-wise polling rates ranged from 52.7 in Sorbhog to 71 per cent in Baghbar, consisted of four of the eight constituencies of Barpeta district. Of these, Baghbar was an enclave within the Thana of the same name, occupying four-fifths of its area. Chenga covered half of Tarabari Thana and a part of Barpeta Thana; and Jania constituency was formed of portions of three Thanas, namely, Baghbar, Barpeta and Sarbhog. In all these Thanas (Tarabari included), the concerned populations were overwhelmingly Assamese-speaking and, except in Sarbhog, also had an overwhelmingly high neo-Assamese Muslim component. This was, for example, reflected in the electoral rolls for Baghbar and Chenga constituencies. In the 1979 rolls, 98 per cent entries for Baghbar and 80 per cent for Chenga were Muslim names.[11] In Baghbar and Tarabari Thanas, Bengali-speakers' concentrations were also quite heavy, being 37.5 per cent and 31.4 per cent respectively. This also favoured a high poll in Baghbar, Chenga and Jania constituencies, despite the fact of large-scale exclusion of non-Muslim Bengali refugees from the relevant electoral rolls.

In Sarbhog constituency, occupying two-thirds of the Sarbhog Thana area, the population was more mixed in social composition. Scheduled tribes represented 15.1 per cent of the related Thana population. Among the Assamese-speakers accounting for 71 per cent of the same, autochthonous elements apparently outnumbered the neo-Assamese Muslims. The Bengali-speakers' comparable share, on the other hand, was 15 per cent. The polling rate in Sarbhog dropped from 73.9 per cent in 1978 to 52.7 per cent in 1983, but the sitting LDA candidate (an Assamese Hindu) was able to retain his seat by retaining support bases within all communities. In this constituency, voters' political considerations were not totally lost in the rising tide of community consciousness.

The voting behaviour of Tamulpur, the lone high poll constituency of Kamrup district, has also to be understood in terms of its highly mixed social composition. Within the Thana area of the same name, 46.4 per cent of the people were Assamese-speaking, 16.6 per cent Bengali-speaking and the remaining 37 per cent speakers of tribal and other languages. Ethnicity-wise, 25.1 per cent of the Thana population belonged to scheduled tribes. In Tamulpur, the polling rate was as high as 73.5 per cent in 1978. It dropped sharply, but not below 50.2 per cent, because of the strong pro-poll attitudes of the tribals here in general and also of other speakers of non-Assamese languages.

### LOW POLL ZONE

In the low poll zone, as shown in the map, we find 53 constituencies forming one continuous large bloc. Of them 30 are in the four eastern-most Upper Assam districts; seven in Nowgong; 13 in Kamrup and one each in Sonitpur, Darrang and Barpeta districts. Besides, Dudhnoi (ST) also stands out in the map as the lone low poll constituency of Goalpara district.

Though the presence of Muslims was not electorally significant in Upper Assam except in one constituency (Naobaicha of Lakhimpur district), that of non-Muslim immigrants of plantation labour origin was. In one of the districts, Sibsagar, the Ahoms (13th century migrants from Burma long Asamiyaised)—caste recognised as 'backward community'—were sizeable in number and dominant. In another, Lakhimpur district, 28.7 per cent of the people were tribals, mostly belonging to the Mishing tribe. Again, the three industrial townships—Tinsukia, Digboi and Margherita—of Dibrugarh district had a multilingual character; in none of these did Assamese-speakers constitute an absolute majority. This could be seen from the Thana-level census data on 1971 (Table 4).

It is interesting to note that in Upper Assam, too, the population was highly mixed, but in a different way. Here, the tribal people generally backed the no-poll stand, as did the Assamese-speaking indigenes including the Ahoms. Besides, if some of the voters of the plantation labour community abstained under duress from voting, others did so voluntarily out of sympathetic feelings for their agitated neighbours. In Upper Assam, therefore, the boycott campaign was most successful in depressing the poll participation in the active constituencies.

The next arena of success for the boycott campaign was the districts of Kamrup and Nowgong. There, too, in as many as 20 active constituencies, as has been said, dominant Assamese-speaking indigenes could depress the poll participation to a low level, despite the presence there of sizeable pro-poll minority groups. Take, for instance, the four urban constituencies (Greater Guwahati which includes also Dispur) under the two police stations of Jalukbari and Guwahati. Bengali-speakers constituted a quarter of the relevant combined population and, in many polling stations, even an absolute majority. But Assamese-speakers who constituted half or almost half of the said population, were much more intensely involved in and much more organised for the no-poll campaign than were the minorities for their counter-stand. The former were able to neutralise many and create a grim atmosphere in which others could come out to vote only at the risk of their lives. The result was an average 7.3 per cent polling in Greater Guwahati.

Let us also look for the reasons of the low 13.4 per cent polling in Dudhnoi (ST), a rural constituency coterminous with the Dudhnoi Thana. There scheduled tribes accounted for 38.2 per cent of its population; and Assamese-speakers—most of them apparently indigenes—for 33.7 per cent. As elsewhere south of the Brahmaputra, the tribals there were as much involved in the anti-poll agitation as their non-tribal Assamese-speaking neighbours. Hence, with mass support to their violent and non-violent action programme, the agitationists could establish hegemonic control in Dudhnoi (ST) which only five years before in 1978 was regarded as a leftist strong-hold. The leftists, though divided, were in 1978 able to secure between them 29.4 per cent of the total votes on the rolls and 46.3 per cent of valid votes cast. But in 1983, the defeated LDA candidate could mobilise, despite left and democratic unity, only 2.1 per cent of the total votes on the rolls and 16.5 per cent of the actual votes cast. This was because of the divisive and explosive situation.

### MEDIUM POLL ZONE

Of the nine constituencies in the medium poll zone, some were almost at the margin of the low poll areas, e g, Goalpara-East (31.7 per cent), Sarukhetri (33.8 per cent) and Baithalangso-ST (30.8 per cent). Some were nearer the high poll margin such as Bilasipara-East (44.4 per cent) and Lumding (41.2 per cent), while others like Barpeta (37.1 per cent) ranged in between. In such constituencies the poll tended to be neither low nor high because of organised pulls in opposite directions, given the mixed social composition, and feelings of insecurity. The settlement pattern and location of polling booths, the numerical inter-community balance, the specific situation of law and order and such other factors determined the actual extent of polling in a complex manner in

TABLE 4: LANGUAGE-WISE PERCENTAGE SHARES IN THANA POPULATION: 1971

| Thana | Assamese Speakers | Bengali Speakers | Hindi Speakers | Speakers of Other Languages |
|---|---|---|---|---|
| Tinsukia | 45.9 | 23.6 | 21.3 | 9.2 |
| Digboi | 41.4 | 17.1 | 14.9 | 26.6 |
| Margherita | 35.4 | 19.9 | 12.0 | 32.7 |

*Source:* Same as in Table 3.

each case. The specific conditions prevailing in Lumding have already been explained in this context in an earlier section.

### NO-POLL ZONE

What would have been the extent of voting in the 21 no-poll constituencies had he polls not been uncontested or adourned *sine die*? The outcome would have then depended, again, on the social composition in each case, the pattern of ettlement, the location of polling staions, the numerical balance of various ocial groups, the intensity of group feelngs on the issue, their organisation and uch other factors.

In most of these 21 constituencies, the organised tea labour was a force, having he capacity to resist pressure in their own ea garden campuses, if they had a will to exercise their franchise in defiance of their neighbour's strong feelings. But, though not involved in any action programme of he agitation, it appears that, in general, hey had a preference for avoidance of onfrontation with their neighbours. In he no-poll area under the Behali and Gohpur Thanas of Sonitpur district, for xample, where speakers of non-Assamese/non-Bengali languages accounted or about 46 per cent of the population, ecause of the presence of tea gardens, medium polling was a strong possibility ad the polls not been adjourned there.

Again, in Bijni of Lower Assam, the tea abour was no factor, and Muslims contituted a sizeable proportion of the Assamese-speakers. Hence, as non-Assamese languages accounted for 53.3 per ent of the relevant Thana population and s there was also a strong minority organiation (Citizens' Rights Protection Committee), there was a probability of high olling had the polls not been adjourned. Though polling could be completed 49 out of Bijni's 76 polling stations, the ection in that constituency was allowed remain incomplete and lapse, because f outbreak of arson and violence.[12] here is no use speculating further in this anner over what could have happened the area.

## IV

While in the post-Emergency 1978 olls, the electors were mainly seized with olitical issues of national importance and ey sent new political forces to the ssembly, in the 1983 polls divisive and arochial issues seized and led them into idespread communal frenzy and vionce. In 1978, the Congress(I) party in ssam got only eight seats; in 1983 it got . In 1978 the left parties, even though ghting against each other, got 24 seats. ut, in 1983, despite their forging a left and democratic alliance, the left parties and their ally, Congress(S), got in all only five seats, another going to the CPI(ML). All this could happen only because of the poll boycott campaign of the anti-foreigner front. The front succeeded, by and large, in mobilising the Assamese-speaking indigenes against poll participation. But it alienated the religious and linguistic minorities, as well as large sections of the tribals by its ambiguous and sectarian slogans, to the extent of pushing them towards the 'protection' of the ruling party.[13]

After the 1983 election, even as the agitationists branded both the newborn Assam Legislative Assembly and the Congress(I) state government as illegitimate and demanded their dissolution, the latter utilised every opportunity to split the agitation by its divide-and-rule policy. The support the agitation received from a section of scheduled tribes and indigenous Muslims at its peak gradually eroded, and the united front it built split into factions. The sweep and grip of this once-powerful agitation is now much reduced, its area of influence having shrunk both geographically and socially. Even the Ahom Community of Upper Assam is now retracing its steps in a big way to rally behind Assam's first-ever Ahom Chief Minister Hiteswar Saikia. The community, which had migrated to Assam long six centuries ago and had lost its language is currently gripped by a revivalist ethnic movement.

More serious than that, the plains and hill tribes, in their pockets of concentration, have once more raised the bogey of their cultures being at stake by Assamese aggressiveness and have renewed their demands for separate states within the Indian Union. There is also talk of separating the Bengali-speaking Barak Valley districts from the State of Assam to make the latter ethno-linguistically more homogeneous. Furthermore, there is now, as was never before since Independence, a growing tide of fundamentalism, both among Assamese and neo-Assamese Muslims, even as the Hindu communal approach is, for the first time, getting a foothold in both the Valleys of Assam.

The regional variations in the 1983 poll verdict as reflected in Fig 1, seen together with Fig 2, suggest that any solution by putting the clock of history back beyond 1971, as demanded by the AASU and its allies, for determining citizenship of migrants from neighbouring countries, will not be acceptable to the major linguistic and religious minorities of the state. If such a solution is insisted upon and imposed, Assam may ultimately face yet another vivisection on an ethno-linguistic basis, as it did earlier during the period 1957-72 when, in the wake of the language movements, Nagaland, Meghalaya and Mizoram slipped out of it one after another.

If the essence of the agitation's demand is preservation of the "small composite nationality of the Assamese" as one of its top leaders put it to a press reporter, then, even 1971 as the cut-off year is not too late for the purpose.[14] The linguistic and religious community-wise balances, as per census figures for the state as a whole, remained almost the same in 1971 as it was in 1951 or 1961. This observation is also true of the situation in the Brahmaputra Valley, the historically evolved homeland of the Assamese as such.[15] Since further delay or procrastination in the matter of finding a solution will only complicate the task of foreigner identification, what could be achieved immediately is to sanctify 1971 as the cut-off year by common consent, identify foreigners on that basis and disenfranchise them through a judicial process and then keep a strict watch on the international frontiers to halt further infiltration. It is our hope that a political settlement of the problem will be made on these lines before the deferred parliamentary elections in Assam are once more held, together with the overdue by-elections to the Assam Assembly. The publication of draft electoral rolls this year in March on the basis of last year's fresh house to house enquiry by the Election Commission progressed so far without any obstruction from the agitators. This has raised hopes regarding a compromise solution within this very year.

## Notes

(An earlier draft of this paper was presented at the Fifth Annual Conference of the North-east India History Association held 18-20 November, 1984 at Aizawl, Mizoram, before being mimeographed as Occasional Paper No 72 of the Centre for Studies in Social Sciences, Calcutta. We acknowledge the help rendered by Anjusree Chakrabarty towards preparing the maps and Rita Banerjee towards arranging and computing the relevant electoral statistics. We are indebted also to J Saikia and D Das, both of the Department of Publicity and Information, Government of Assam, and to Amit Nag, a journalist based at Guwahati, for their prompt help in procuring copies of the official publication on the 1983 Assam Elections issued by the Chief Electoral Officer, Assam, for our use. Discussions with colleagues at the Centre helped us to give a final shape to this paper in its present form.)

1 In its verdict of September 28, 1984, the Supreme Court of India upheld the Assam

polls of 1983 and the related 1979 electoral rolls as legally valid. Whether the conditions prevailing were congenial to free and fair elections, in general, was outside its consideration.

2 The coverage of the Assam polls of 1983 by the national press was devoid of clarity and accuracy. We have, therefore, throughout this paper, used S L Khosla, Chief Electoral Officer of Assam, compiled, "The 7th General Election to Assam Legislative Assembly—1983 and Elections to Fill up the Twelve Vacancies in the House of People—1983: Statistical Analysis" (Gauhati, 1983), for the relevant poll statistics.

3 The All-Assam Gana Sangram Parishad was formed on August 26, 1979 and, on its executive body, were represented the All Assam Students' Union (AASU: established in 1967), the Purbanchaliya Lok Parishad (PLP: estd in 1977), the Assam Jatiyatavadi Dal (estd in 1977), the Assam Sahitya Sabha (estd in 1917) and five other bodies of lesser importance. The AASU took initiative in the formation of this united front and remained its accredited leader until serious intra-front differences broke out in August 1984 on such issues as that of the AASU's unilateral secret negotiations with the ruling Congress(I) party for a deal facilitating its participation in coming elections.

4 For the nature and extent of the January 1980 massacres, see the report of the fact-finding committee of the People's Union of Civil Liberties (PUCL), New Delhi, as fully serialised in *Mainstream*, March 8, 1980 and subsequent issues.

5 The death roll relating to the anti-foreigner agitation increased to 226 by December 24, 1980 and to 340 by October 7, 1982, according to statements respectively made in the Rajya Sabha and the Lok Sabha by the then Home Ministers—*The Statesman*, December 25, 1980 and *Anandabazar* (Bengali daily), October 8, 1982. The number went on increasing, as fresh assassinations took place and dead bodies of missing persons were from time to time discovered. Thus, even according to the government's own conservative counts, the deaths caused by the violent agitation during the three and half years preceding the 1983 election process numbered some 500 in all. The figure, of course, also includes deaths from police firings on agitators and cases of assassination of pro-poll political workers.

6 According to the Chief Minister of Assam, Hiteswar Saikia, "more than 4,000 lost their lives over the 1983 Assembly elections", *The Statesman*, September 14, 1984. Non-official estimates of the deaths far exceed this latest official estimate.

7 These figures are from our basic primary source, as mentioned in note 2. For constituency-wise detailed computation and analysis based on this source, see our mimeographed Occasional Paper No 72 (CSSSC, 1985).

In yet another official publication, "Report on the General Election to the Legislative Assembly of Assam 1983 (Narrative)", published by the Election Commission of India, the aforesaid two figures are, respectively, given as 7,245 and 8,655 thousand voters. The anomalies remain unexplained, as this latter report does not give constituency-wise breakdown figures. Hence, we have not used this latter report.

8 This figure of the total votes polled in the contested constituencies is, however, the same in both the official sources.

9 The process has been discussed in greater details in Amalendu Guha, "Nationalism: Pan-Indian and Regional in a Historical Perspective" (Presidential Address to the Modern History Section, Indian History Congress, 44th Session Burdwan, December 1983), in *Social Scientist*, February 1984, pp 53-61.

10 Francis Buchanan Hamilton, "Account of Ronggopur" (Manuscript, India Office Records, London), Book 2 and appended statistics. His estimate was for an area covering the present districts of Dhubri, Goalpara and a part of Kokrajhar district.

11 Chief Minister Hiteswar Saikia's statement reported in the *Statesman*, August 11, 1984.

12 Thousands of houses were set on fire in Bijni and adjacent Abhayapuri constituencies, which had remained relatively calm earlier, as a result of the communal frenzy of 1983. In the town of Bijni itself, the distruction of the impressive building of the Assam Government's Flood Control Department and of the Bengali-medium Higher Secondary School by arson—such instances indicate the nature and persistence of the widespread sabotage method and the role it played in course of the movement Such cases of arson regularly took place since 1979. See *Janajiivan* (Assamese Weekly, Guwahati), Vol 4, February 26, 1985 and its earlier issues.

13 See "Historian Takes Close Look at Assam Crisis", the *Hindu*, April 14, 1983.

14 The quote is from Bhrigu Phukan's reply to S Gurudev, *The Statesman* (October 1, 1984).

15 Assamese-speakers' percentage ratios to the total populations in the six old districts of the Brahmaputra Valley during 1911-71 were as in Table A.

TABLE A

| District | 1911 | 1921 | 1931 | 1951 | 1961 | 1971 |
|---|---|---|---|---|---|---|
| Goalpara | 14.2 | 18.2 | 18.3 | 62.0 | 66.1 | 63.5 |
| Kamrup | 79.2 | 75.5 | 66.5 | 79.0 | 80.8 | 76.7 |
| Darrang | 44.4 | 36.6 | 32.9 | 77.4 | 65.1 | 62.8 |
| Lakhimpur | 33.8 | 29.8 | 30.4 | 64.1 | 63.0 | 62.9 |
| Nowgong | 64.4 | 52.9 | 42.2 | 69.1 | 76.8 | 73.7 |
| Sibsagar | 56.7 | 52.3 | 54.0 | 84.4 | 85.5 | 72.6 |
| Total Brahmaputra Valley | 49.2 | 44.6 | 42.0 | 73.2 | 73.3 | 71.0 |

*Source:* Worked out from census data. There was no language census in 1941 and no census in Assam in 1981.

## Gujarat Metalform

GUJARAT METALFORM, a new company, is setting up a Rs 250 lakh project at village Karannagar in Mehsana district of Gujarat for annual manufacture of 4,500 tonnes of high tensile fasteners and 500 tonnes of automobile components. The company has imported its main machinery and equipment under OGL from National Machinery of West Germany. Initially, the project is being implemented with an installed capacity of 2,000 tonnes per annum. The full licensed capacity is intended to be installed in three to four years. The project is nearing completion and is expected to go on stream shortly. The company has been promoted by Sanjay S Lalbhai of the Lalbhai Group and Chintan N Parikh, an industrialist, managing a number of companies engaged in a wide range of activities. The company is making a public issue of 3.60 lakh equity shares of Rs 10 each at par to raise a part of the finance required for the project. The subscription list will open on May 20. The issue is managed by Bank of Baroda's Merchant Banking Division.

# Case for Injectible Contraceptive

**Iris Kapil**

THE article "Retreat on Depo-Provera?" by Padma Prakash (1984a) raises an issue of great importance, one that deserves public examination and discussion. I am writing to give fuller information and a different perspective than was presented in the article and also to explain why I think your readers should become better informed about Depo-Provera.

Depo-Provera is the brand name for the world's most widely used injectible contraceptive, medroxyprogestorone (DMPA). The issue is: What contraceptive technologies should the government make available to the public through its family planning programmes?

Most people in India would agree that a well planned, well managed family planning programme is essential to the nation's socio-economic development. Moreover, most couples in India, including poor and rural families, would prefer to have fewer children than they actually have. Motivation to limit family size is increasing with the rapid modernisation of the economy and society (Srinivasan, et al, 1984).

Given the national commitment to family planning and a broadly felt need for family planning services, the government's responsibility is to implement an effective family planning programme, one which makes easily available, to all couples, at a reasonable cost, the safest, most reliable, most convenient contraceptives. The question, then, of technologies for birth control becomes critical. The government decides which contraceptives to offer in its programme and that choice shapes programme organisation, strategies for delivery of services, manpower requirements, equipment and supply needs, costs.

What are the possible contraceptive technologies around which an effective government programme can be built? Let us first consider those already being used and return to the case of DMPA.

### Disadvantages of Sterilisation

The present Indian government policy, although nominally a 'cafeteria' approach which offers the oral contraceptive (the pill), the interuterine devise (IUD), condoms and sterilisation to the couple, is, in reality, a programme which promotes sterilisation of women. For the organisation, the advantages of the sterilisation approach are obvious: management becomes enormously simplified. Termination of fertility means that the programme staff need bother no more with the woman and her family. Unlike a programme built around contraceptives, continuing education and persuasion by the field staff is dispensed with; medical and paramedical care for the woman is no longer needed; supply and logistical problems are minimised.

The disadvantages of an active sterilisation programme are now receiving attention and being reported. These disadvantages can be viewed from the perspective of the woman or of the nation. Let us first consider the latter.

Basu has set forth the arguments for rethinking the present emphasis on female sterilisation (Basu, 1985). She prefers a (re)emphasis on vasectomy, since sterilisation of men is a simpler and safer operation than female sterilisation. Most importantly, she points out that "Indeed, from the viewpoint of demographic effectiveness, it would be worthwhile to increase greatly the availability of non-terminal methods of birth control (see, for example, Basu, 1984). For while it is true that sterilisation requires a one-shot procedure, its acceptance requires a much greater degree of motivation, because of its final nature and because it involves surgical techniques, than do well-provided birth-spacing or delaying contraceptives. Which is why acceptors of the loop and the pill tend to be younger and have fewer children than those who undergo sterilisation, whether male or female. And by drawing more such women into the family planning programme, even if they end up having exactly the same number of children as the sterilisation acceptors, birth rates will be affected downwards by the larger gaps between pregnancies. Moreover, in practice they will *not* have the same number of children as women whose first exposure to birth control is to sterilisation."

In other words, an active female sterilisation programme may not, after all, yield the greatest population growth rate advantage. Perhaps a slower population growth rate would be achieved with a well-managed family planning programme that educates families and communities to the benefits of a small family and provides them with the contraceptives and health services which enable them to have babies only when wanted.

The cost of the sterilisation programme to the poor woman is high. If a woman from a fairly prosperous family decides to be sterilised, chances are she will have the surgical procedure done properly, in a sterile setting by a doctor who can be held accountable to the family, and she will enjoy proper post-operative care and rest. For the poor woman, the situation is very different (Pettigrew, 1984). A village woman who undergoes sterilisation has the operation in a camp or in a hospital setting that may well be unhygenic. She returns immediately to her heavy household and farm work. Her wounds may become infected. Because of malnutrition and poor health, she will heal slowly and suffer considerable pain. Her children, now irreplacable and whose work is necessary to family survival, have a nearly 75 per cent higher chance of dying than does an urban child (UNICEF, 1984, p 30).

### Laparoscopy

The new female sterilisation technique, laparoscopy, is undoubtedly far safer than the tubectomy. However, to be performed successfully, the laparoscopy must be done by a specialist, someone highly trained in the technique, using an expensive fibre optic surgical instrument. The specialists and the instruments are too scarce to be based in rural areas for family planning programmes. Technological requirements have lead again to sterilisation camps, where doctors are paid by the day and the incentive is to perform as many sterilisations as possible during the alloted time. Follow-through for the women has definitely not been a notable feature of the programme.

Prakash, in an article on laparoscopy, draws attention to the strong statement issued by the Indian Assocation of Gynaecological Endoscopists criticising the way mass sterilisation camps are conducted. While the Association recommends that to keep the instrument sterile, no more than 25 operations a day be done, the actual number performed in a sterilisation camp is closer to 500. The camp sites, moreover, are usually unhygenic and, after a few hours, the surgeons fatigued and undoubtedly prone to making errors that can cause irreparable damage to the patients. Certainly, the death rate from sterilisation in the camps, an estimated 10 to 12 per 100,000 operations, is higher than the rate of 0.25 to 0.5 expected when the procedure is done under acceptable conditions (1984b).

It can be argued that even with this death rate women are better off, on the average, being sterilised than facing the higher risks of death in child birth and abortions. An analysis made in Bangladesh "indicates that the current sterilisation programme is highly effective measured by either pregnancies or deaths averted . . . Sixty-four of every 10,000 pregnant women in Bangladesh die due to complications of pregnancy, while sterilisation, which effectively averts pregnancy, results in the death of 10 in every 10,000 women" (Rosenberg and Rochat, 1982). Basu, however, reminds us that a programme can be politically damaged by bad planning and inefficient implementation. "Just as, after an initial enthusiastic welcome, the IUD rapidly lost favour with the population largely because of sudden widespread fears about its real and imagined side-effects, the careless and hasty promotion of laparoscopy without sufficient services for information and follow-up could well suffer a backlash because of a few (*sic*) wrongly handled cases" (Basu, 1974).

The problems with the IUD, the pill and the condom for poor and rural families are well known. Barrier methods, such as the diaphram and spermacidal jellies, are too expensive and cumbersome to be considered at all as a programme element. The condom has not proved acceptable to most men. The IUD can be ideal for a reasonably healthy woman but for the programme it entails a heavy input of skilled manpower. It must be inserted by a skilled paramedic or doctor. Even then, regular medical attention is needed, since the woman's body can expel it without her knowledge. It should also be periodically checked and replaced. The IUD can cause heavy menstrual flow, which is damaging to the health of an already anaemic woman. The pill is quite safe for women not suffering from high blood pressure or diabetes, but it is expensive, its storage and regular supply in rural areas presents many problems and, most serious of all, the woman may forget to take it each day.

It is generally believed that because they cannot cope with contraceptives, poor women have only sterilisation as an option. This may be true, as long as the only contraceptives available are the pill and IUD; their effective use is simply more than an underprivileged, undernourished, overworked woman can handle.

For the family planning programme the pill and IUD pose almost insurmountable problems. For these technologies, the programme faces the overwhelmingly difficult tasks of educating the community and family, as well as the woman, about the contraceptive technology; of providing the required services and supplies to the family, at their convenience, in the home; of helping the couple, who ordinarily lack knowledge of biology, to understand and anticipate possible side-effects of the contraceptive.

### INJECTIBLE CONTRACEPTIVE

Which brings us to the injectible contraceptive.

The injectible contraceptive, DMPA, is reliable, long lasting (about three months), easy to use, easy to administer, and, as an injection, acceptable to most women. Since it does not stop lactation, as does the pill, it can be used soon after child birth. The cost ($ 0.50 to $ 1.00 per dose) is still somewhat higher than for the pill or IUD but not so high that a government programme cannot afford to subsidise it. An immediate possible side-effect of the injectible contraceptive is a diminution or even cessation of menstruation, but research shows that this is not medically harmful and may actually be beneficial to a woman who is anaemic.

Injectible contraceptives are one form of the drug progestins, which is used in the standard 24 hour oral contraceptive pill. The effectiveness of some progestins can be prolonged by incorporating them into an injectible solution or a carrier that gradually releases the hormone. (Other ways to administer long-acting progestins are in hormone-releasing IUDs, implants placed under the skin, vaginal rings and once-a-month pills.) Thus they can be effective for one month to five years or more. The two tested, highly effective injectibles are:

—medroxyprogestorone acetate in its depot form (DMPA; Upjohn Company trade name, Depo-Provera)

—norethindrone enanthate (NET EN; Schering AG trade name, Noristerat).

Laboratory experiments on animals and controlled observation of women using DMPA have been, and continue to be, made for testing the safety of the injectible.

"Concern over injectibles focuses on studies in beagle dogs, which developed benign and malignant breast tumors and studies in monkeys, which developed endometrial cancer while receiving high doses of these hormones. The relevance of these animal studies to humans has been questioned. In particular, testing hormones in dogs at very high doses has been challenged.

"Studies in humans using injectibles show no increased risks of cancer. Most human studies, however, have not been large enough or have not had adequate controls over long-term follow-up needed to produce conclusive results. An ongoing, large, multicentre study conducted by the Special Programme of Research, Development and Research Training in Human Reproduction of the World Health Organisation (WHO) is providing clearer answers to the cancer question. Preliminary results show no added risk of breast or cervical cancer with DMPA use ... In addition, a number of methodologically sound studies of combined oral contraceptives suggest that, in humans, progestins protect against endometrial and overian cancer and have no effect on breast cancer risk. In fact, progestins, including DMPA, are used to treat endometrial cancer.

"After examining the cancer issue, the WHO Toxology Review Panel and the International Medical Advisory Panel of the International Planned Parenthood Federation, as well as a number of other medical bodies, have endorsed the use of DMPA.

"In the rare cases where pregnant women were exposed to DMPA, no increase in congenital malformations or prematurity has been observed. Also, there has been no increase observed in congenital anomalies when women become pregnant after the contraceptive effect of DMPA has ended ... In the 1950s and 1960s large doses of various progestins were given to pregnant women to try to prevent threatened or habitual abortion. This treatment ... is no longer recommended" (Population Reports, 1983).

Other medical bodies endorsing DMPA, under its trade name Depo-Provera, for long term use include the British Ministry of Health, the Federal Republic of Germany Health Office and Sweden's National Board of Health and Welfare. Injectible contraceptives are now legally permitted in over 100 countries and level of use is increasing. For example, in Sri Lanka in 1981, over 70 per cent of new acceptors of reversible methods chose the Depo-Provera.

From a programme management perspective, the advantages of the injectible over other contraceptives are great. Unlike sterilisation, its use does not require persuading anyone to make a drastic decision nor does it result in a trumatic experience for the woman; in fact, rural people in most countries have come to equate the injection with effective medicine and prefer it. Highly skilled medical personnel are not needed to deliver the service; a paramedic checks the woman's health and then trained workers can take the injection to the home on a three month schedule, using an individually packaged dose with its own sterile, disposable needle. The family planning worker need not give long explanations or lessons on how to use it, although field workers must explain and counsel with the woman about diminished menstruation.

With all these advantages, one would assume that the injectible contraceptive would have become the basis of programmes everywhere and, indeed, it is increasingly the preferred contraceptive in many countries. However, acceptance has been slowed by a controversy that has as much, or more, to do with consumer group and government regulatory body politics within the United States as with the medical nature of the drug. Prakash, in her article "Retreat on Depo-Provera?" sides with those who believe that DMPA is dangerous and should not be allowed onto the market. Since the issue is of such importance to family planning, it is worth the trouble to look briefly at history of the controversy.

### THE US CONTROVERSY

The injectible is not approved for use as a contraceptive in the United States, although the United States Food and Drug Administration (FDA) has had it under reveiw for many years. In 1973 the FDA's Advisory Committee on Obstetrics and Gynaecology recommended the Depo-Provera drug, DMPA, for use as a contraceptive. In 1975 the FDA convened a joint meeting of its Advisory Committees on Obstetrics and Gynecology and on Biometric and Epidemiologic Methodology. The Committees in turn jointly constituted a sub-committee task force which, after open hearings, recommended that the FDA approve DMPA as a contraceptive.

Because of controversy aroused by consumer groups, the FDA continued the review of DMPA and, in March 1978, decided to deny approval of Depo-Provera for use as a contraceptive in the United States. The manufacturers, Upjohn Company, appealed against the decision. In July, 1979 the FDA announced that the appeal would be heard by an FDA-appointed Board of Inquiry. The Board of Inquiry was convened in January 1983 and it is that report, issued in 1984, with which Prakash begins her article. The Board recommended against approving DMPA for marketing in the United States.

How does one know whom to believe? When making policy-decisions, responsible authorities receive advise from many sources and they must judge carefully the credibility of each. The source of the technical information I presented above is a report issued in 1983 by the Johns Hopkins University (Population Reports, 1983). This report was written on the basis of all available published and unpublished materials plus additional correspondence and interviews. Before publication it was reviewed by people well known for their work in contraceptive technology and family planning. I have also included information from a large body of materials made available by the International Planned Parenthood Federation (IPPF), (IPPF Fact Sheet, 1984). Among the materials is a summary of the FDA Board of Inquiry report.

Another source of information is a technical article on breast-feeding in the *Scientific American*, April 1984. Its author recommends Depo-Provera as a contraceptive. "One of the most effective and safest contraceptives for lactating women in developing countries and the simplest to administer is Depo-Provera . . . I touch here on an area of controversy. Studies by WHO have as yet failed to identify any health risk associated with the use of Depo-Provera and have shown no adverse effect on the composition or yield of breast milk . . . Because of opposition from consumer groups, the US Food and Drug Administration has reversed a decision it once reached to approve the drug for contraceptive use in the US; the case in on appeal. Hence Depo-Provera cannot be part of family planning programme funded by the US Agency for International Development" (Short, 1984).

The FDA decision will be made for American women but, since policy guiding US foreign assistance requires that it follow US law, whether or not USAID will provide the injectible contraceptive to family planning programmes may depend on whether or not it is sold in the United States. In 1978, the United States Agency for International Development (USAID) requested an ad hoc Consultative Panel on DMPA be formed to review a variety of issues relating to DMPA and its possible provision in the International Programmes of USAID. In July 1980, after a review of the various materials and information, and after making what in its own view was as thorough as possible an assessment of the risks *versus* benefits of DMPA use in humans, the Panel recommended that USAID make DMPA available to those nations that especially request it for use as a contraceptive.

The organisations presently providing DMPA for contraceptive use to family planning programmes are the World Health Organisation, the United Nations Fund for Population Activities and the International Planned Parenthood Association.

The American consumer groups which are proving effective in delaying, perhaps stopping, government approval of the injectible represent only a small proportion of the American public. The groups are certain feminists organisations such as the Women's Health Network, a few scientists (Gold and Willson, 1980), and certain conservative political groups who oppose any funding at all for family planning programme in developing countries. These groups form an active one-issue lobby which, in the US political system, can bring great pressure to bear on government decision-makers. In the past decade one-issue political activists have become extremely influential in the American political process.

For Depo-Provera, the American public has shown little interest and no counter consumer groups have taken up its cause. It is quite possible that Americans believe they already have easily available a sufficient variety of convenient contraceptives. Also, it is interesting, maybe relevant, that Americans tend to favour taking their medications orally rather than by injection. However, if the injectible contraceptive were easily available its three-month duration and its use during lactation might prove attractive to many American women.

Consumer groups make an essential contribution to public policy formulation. Several of the groups concerned with DMPA are to be commended, as is Padma Prakash, for focusing attention on the health and welfare needs of women. In this particular case, however, perhaps they should rethink their position. They should remember that, as with all medications, no contraceptive is perfect; all have side-effects which are more or less discomforting or harmful.

### STRONG EVIDENCE

All of us make decisions on which medications or contraceptives are both effective and reasonably safe for use by ourselves and those persons for whom we are responsible. Since few of us are biomedical experts, we turn to experts for advise. Prakash prefers the judgment of one US advisory body over that of other American experts and over that of the ministries of health of Great Britian, West Germany, Sweden and scores of other countries. She mistrusts the advise of experts representing the world's most respected health care international organisations. If we cannot trust the technical judgment of researchers working under the aegis of the World Health Organisation and the International Planned Parenthood Federation, whom *can* we trust?

The evidence is strong that the injectible contraceptive is as safe as any other birth control technology now available. The greatest danger is not the remote chance of cancer or deformities induced by a contraceptive. The greatest danger to a woman's health, and to the health and very life of her babies, is too many births, too closely spaced. In my view, Indian women should have the right to use the injectible contraceptive if they so wish.

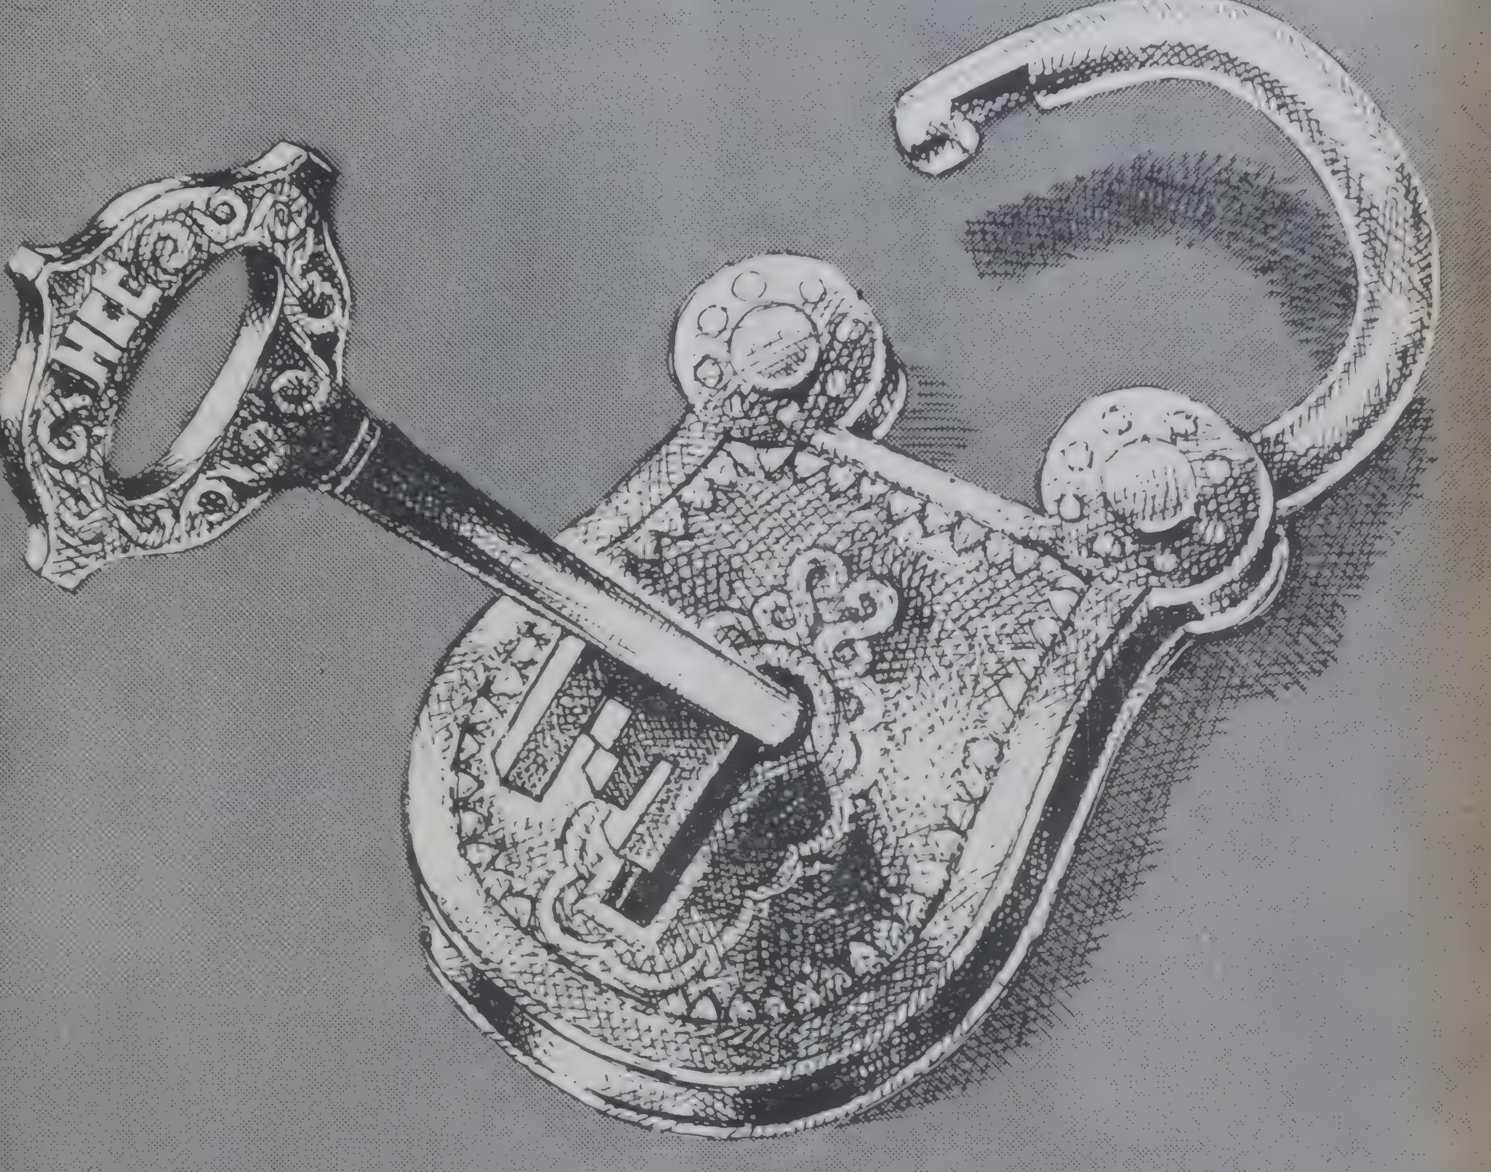
The *TURNKEY* Capability



Yes, that's what
HCC can offer
exclusively !

A turnkey contract covering every activity from conception to completion ... and even commissioning too for Environmental Engineering projects. No wonder, as with HCC . . . everything clicks so well!

For the Design and Construction of:

Bridges for road and rail communications; Marine Structures; Industrial Structures for steel, sugar, cement, oil refinery etc. Foundation Engineering including piling works and soil strengthening, Cooling Towers and Chimneys, Environmental Engineering-water and waste water treatment, Power Houses and Aqueducts.

*Almost every new life insurance policy tells a story of love for the family and concern for the security of its members.*

LIC wrote 27.02 lakh individual policies during 1984-85, covering new business of Rs. 5401.43 crores – a new record.

During 1984-85 LIC's completed new business (individual assurance) in India of Rs. 5401.43 crores was an improvement of 23.1% over the previous year. The number of new policies were 27.02 lakhs, up 14.2% over the preceding year.

The Corporation completed total group business of Rs. 8047.42 crores covering 6.67 lakh lives. The total number of new group schemes during 1984-85 was 2326 – an increase of 16% over 1983-84.

Individual and group insurance, taken together, accounted for new business of Rs. 13,448.85 crores during 1984-85 – the Corporation's best performance so far.

Weaker sections brought under insurance cover during the year included oilseed growers of Ahmedabad; working deaf girls in Madras; tailors in Kozhikode; manual labourers (road layers, building repairers, etc.) of Coimbatore; forest labourers of Udupi; handloom weavers of Kanpur; blind workers of Indore, Madras and Meerut; and village and folk artistes of Cuddapah.

Among LIC's five zones, the Eastern Zone registered the highest business growth rate – 29.4 per cent.

Among the 43 divisions, the Indore Division in Central Zone topped the list with a growth of 45.7 per cent.

“Mummy, I hate nights because I can’t see your face”.

**40,000 children in India go blind every year from malnutrition. Night-blindness is the first stage.**

This tragedy can easily be prevented — with an inexpensive diet of green leafy vegetables. Or with adequate doses of Vitamin A.

Vitamin A is produced in India. Capability to meet the country's full requirements already exists.

Government agencies and voluntary organisations are trying to educate parents on the value of green leafy vegetables in the diets of children. But it's hardly enough.

What is now needed is nation-wide determination, a new nation-wide commitment — the forging of a "national will" as it were — to fight the disease of blinding malnutrition (Xerophthalmia).

India eradicated smallpox with a national campaign. We can eradicate Xerophthalmia too; we MUST.

**Get involved. Write today for a free leaflet on Xerophthalmia.**

# Playing Politics

THE reprehensible bomb attacks by Sikh terrorists in Delhi and in towns in UP, Haryana and Rajasthan, in which nearly 100 innocent people have been killed and a larger number injured, are a reminder of how grave the situation in Punjab continues to be. The terrorists perhaps hoped to provoke a backlash in the form of another round of attacks on and killing of Sikhs. This has not materialised which incidentally is a pointer to how the anti-Sikh pogrom of last November had succeeded because of its political inspiration and the government's failure to take timely action. The well planned and successfully executed terrorist action has nevertheless exposed that a year of virtual army rule in Punjab, with the paramilitary and police forces too enjoying a free hand, has failed in putting down terrorism.

The government's response to the bomb attacks has been along expected lines. It has decided to bring forward new legislation to amend the Arms Act, the Criminal Procedure Code and other laws to give even more sweeping powers to the police to deal with terrorism. It will be difficult to argue, however, that if the government has not been able to contain terrorism, it has been because of lack of legal powers. The army and the rest of the security forces have had at their disposal the Punjab Disturbed Areas Act, 1983, the Chandigarh Disturbed Areas Act, 1983, the National Security (Amendment) Act, 1984, the Armed Forces (Punjab and Chandigarh) Special Powers Act, 1983, the Code of Criminal Procedure (Punjab Amendment) Act, 1983, and the Terrorist Affected Areas (Special Courts) Act, 1984. In fact, the abandon with which the powers conferred by these special laws have been used—the indiscriminate rounding up of young men, including teenagers, for questioning, the interrogations and torture, the prolonged detention on mere suspicion—has contributed in no small measure to the growing sense of alienation among the Sikhs in Punjab.

What has been lacking in the government's approach to the situation in Punjab is political wisdom and sincerity. In his statement on the bomb explosions, the Home Minister once again accused the Akali leaders of not making "a positive response" to "the measures that we initiated in the last two months to bring the process of normalisation". The terrorist bomb attacks, he said, were "a challenge to [the Akali] leadership to wake up and understand the immense damage they were causing the nation" and added, "I trust that even at this stage, they will realise the grave implications of their actions and the extremist forces they have indirectly unleashed". These accusations, however, lack credibility on a number of counts.

First, the Home Minister knows only too well that the activities of the Sikh terrorists, such as the recent bomb attacks, are aimed as much against the Akali Dal leadership as they are against the government. Second, the so-called 'concessions' offered by the government to the Akali Dal to which it expects a 'positive response' from the latter actually amount to very little: the belated ordering of a judicial enquiry into the massacre of over 2,000 Sikhs in the wake of Indira Gandhi's assassination (in any case the enquiry has yet to seriously get going), the release of a small number of senior Akali leaders and the lifting of the ban on the All-India Sikh Students Federation (which it is difficult to believe was not meant to add to the political problems of the Akalis). Third, the government's own attitude to the initiation of talks with the Akali leaders has been ambiguous, to put it mildly. To mention the latest evidence of this, the moment the late Bhindranwale's father, Joginder Singh, sought to challenge the leadership of Longowal by 'dissolving' the Akali Dal and setting up a so-called *ad hoc* committee, the government let it be known that it was not interested in any contacts with the Longowal group till the question of leadership in the Akali Dal had been settled.

This has reaffirmed once again that the government's approach to the Punjab problem continues to be dominated by the Congress(I)'s ambitions of eroding the support for the Akali Dal, which had been responsible in a large measure for the original sin of building up Bhindranwale. It is now leading to tacit encouragement being extended to elements like Joginder Singh, even though they avowedly stand for a more uncompromising attitude to the securing of undefined Sikh demands. Against this background, the fact that a Congress(I) supporter has been nominated by Joginder Singh as the general secretary of his *ad hoc* committee or even the revealed Congress(I) links of some terrorists arrested recently should come as no surprise.

## *The Bomb*

### Dangerous Game

*A Correspondent writes:*

BY organising a round-table for voicing the demand for going nuclear, as it seems to have done, the Servants of the People Society of New Delhi, has hardly served the people—of India or anywhere else. By further advocating the making of the 'bomb' behind the back of the Indian people, the so-called round-table displayed a dangerous disloyalty to the people. As *The Statesman* reported from New Delhi on May 12:

> At a day-long 'round-table' discussion on the nuclear threat and India's options, organised by the Servants of the People Society here yesterday, a broad view emerged that, with Pakistan close to having a nuclear weapon or already having it, it would be most unwise for India not to have it too. The view was also voiced that India did not have to declare its intentions in this respect in advance; it should act first, and could then inform the people.

Most vehement in demanding nuclear arms and that too in secret and without a public discussion was K Subrahmanyam who has the reputation of being a defence strategist. According to the newspaper report,

> He [Subrahmanyam] disagreed with the suggestion that a decision in this respect could be taken after a public debate ... The government had the right of decision in this matter and it did not have to 'articulate' that decision in advance to the public.

Without denying or minimising the serious threat to the Indo-Pak subcontinent created by Pakistan's sinister designs in collusion with the US and some other Western powers for making the bomb, the New Delhi conclave has to be branded as a dangerous provocation. Subrahmanyam and his confreres are in a sense guilty of abetting the Pakistani military rulers. By urging secret nuclearisation by India, this gathering of Indian notables has really provided new arguments and 'moral' justification for Pakistan's semi-secret contrivings in this field, particularly because India has a record of secret nuclear explosion at Pokhran more than a decade ago.

Subrahmanyam put forth another dangerous argument that India could go in for nuclearisation without provoking an arms race with Pakistan because that country "had only a fraction of India's GNP". Doesn't he know that Pakistan (just as Israel) does not have to depend on its own limited resources for arms—nuclear as much as conventional? The US purse-strings are always and increasingly open for this purpose.

The specific, and dangerous, 'consensus' apart, the New Delhi round-table is also significant in another sense: it represents a coming together of defence strategists, retired army officers, retired diplomats and top bureaucrats, MPs, journalists, academics and so on—that is, elements which provide the foundation of the think tank and PR work for the notorious military-industrial complex in the USA. Seymour Melman in his famous study "Pentagon Capitalism" in 1971 listed among others the following as the principal auxiliary groups behind the US phenomenon: career men, military and civilian, in the armed forces; people working in the military research-and-development establishment; Members of congress . . .; people of strongly authoritarian personality who identify with martial leadership.

The people of India should beware of these 'servants'. All Indian democrats must protest against any attempts at decision-making on nuclear weapons—a supreme question of human survival—behind their back. It is foolish to believe that in the present international situation Pakistan could really make use of any of its extremely limited—toy-sized by the present world standards—bombs even if it succeeds in making them. Look at Israel which is reported to have possessed some similar bombs for some time past—it has had to retreat and make concessions to Palestinians and Arabs, much weaker and divided though they are.

## *Steel*

### Failure of Planning

THE fluctuating fortunes of the steel industry clearly reflect the gross inefficacy of the country's planning process with respect to even attainable physical targets.

In 1982-83 domestic production of steel had to be supplemented by 1.3 million tonnes of imports. Now, in the current year, about 1.7 million tonnes of the metal are to be purchased from abroad as the output of about 10 million tonnes is expected to be insufficient. In between, in 1983-84, the industry was saddled with huge stocks, pushing the integrated public sector plants run by the Steel Authority of India into massive losses. This happened despite production being curtailed to 8.8 million tonnes, with the SAIL plants—which account for roughly 60 per cent of the industry's total capacity—operating at only about two-thirds of their full capacity.

1983-84 did witness a recession in the engineering and automobile industries, thereby reducing the demand for steel in that year. There was in addition a drop in demand from the major consuming sectors, namely, power and railways. The demand of these latter two sectors could well have been regulated to not only ensure better capacity utilisation, and therefore better financial performance, of the SAIL plants but also to probably pre-empt the need for large imports of steel in the current year. For instance, the 0.2 million tonnes order placed by the National Thermal Power Corporation for 1985-86 is more than 50 per cent higher than the supplies sought last year, which was even lower than that of 1983-84. Similarly, the railways will be lifting 0.68 million tonnes of the metal in 1985-86 as against only 0.27 million tonnes in 1984-85. If the steel requirements of such undertakings had been carefully planned in collaboration with the steel industry then the quantum of imports would probably have been lower this year. There are certain qualities of steel which are not being manufactured domestically and therefore need to be imported. The exact quantum of such imports is not known though in 1983-84 0.64 million tonnes were imported, i e, as much as one million tonnes lower than in the current year.

The factors underlying the 'faulty' planning would be worth investigating. One possible explanation could be the Union government's desire to curtail long-term investment in the years immediately preceding a general election so that the funds could be diverted for populist measures.

It needs to be added that the chronic problem of low level of capacity utilisation in the public sector will continue in the current year too. The utilisation in 1985-86 is expected to be roughly 80 per cent, i e, about the maximum level attained in the recent past. Steel plants do operate at even over their full capacity, which if achieved by the SAIL units would mean a drastic reduction in imports.

An aspect interrelated to the proper use of capacity is that of price. The price of steel was raised twice during last year, the second time by as much as 25 per cent in January 1985, essentially to boost the earnings of the SAIL plants. So following two consecutive years of losses, SAIL did end up with a profit in 1984-85. Had SAIL's capacity utilisation been better in 1982-83 and 1983-84 its finances would have been better too. Then there would probably have been little justification for the rise in steel prices last year, or at any rate the steep hikes. In this context it is not very surprising that, given the high level of capacity utilisation in the current year, the Union Minister of State for Steel and Mines categorically assured the Parliamentary Consultative Committee of his ministry on May 15 that there would be no hike in the price of steel for the next twelve months.

## *Sri Lanka*

### Escalating Conflict

THERE appears to be little prospect of a negotiated settlement of the Tamil problem in Sri Lanka, at least in the near future. The killings and counter-killings have led to a hardening of attitudes on both sides, i e, the government and the Tamil groups. The Government of India's earlier strategy—of bringing about some sort of disengagement, followed by a cooling-off period, leading to a renewal of dialogue between the two sides—does not seem to have made much headway.

The conflict has escalated to a stage where either side can, with a semblance of 'legitimacy', blame the other for inviting punitive reprisals. This is evident for instance from the latest round of bloodshed that occurred in the Buddhist holy city of Anuradhapura this week claiming over 200 lives. Over 85 Tamils were killed, including 48 travelling in a launch, on May 15 in retaliation for the slaying of 175 Sinhalese the previous day, which in turn was said to be in retaliation over the murder of 75 Tamils by the army last week, and so on.

The growing violence seems to have pushed the Tamils towards extremist solutions and thus to supporting extremist groups. (The competing zeal of these groups to exhibit their prowess and thereby win popular support could also be partly responsible for the continuing retaliations.) Even the moderate Tamil United Liberation Front, which earlier took part in talks with the Sri Lankan government, now believes that with all doors for a negotiated settlement being closed there is no alternative but to mobilise mass struggles. Such widespread sentiment, together with some successes scored by the Tigers against the security forces, has egged on the Tigers; so much so that they are firmly opposed to any ceasefire as they feel it would only give an opportunity to the government to rebuild the 'demoralised' Sri Lankan army. Negotiations, the Tigers say, can be held only after the balance of power has shifted in their favour, which they expect will happen through their guerrilla actions in the coming days. Their efforts to convert the Tamil-speaking Muslims in the east to their cause, however, seem to have been sabotaged by sustained Tamil-Muslim riots a few weeks ago, allegedly instigated by government forces.

The demands too have become more extreme. On April 10 spokesmen of four Tiger groups, with their headquarters in Tamil Nadu, stated that they have decided to co-ordinate their functioning "for armed revolutionary struggle for national independence". The Tigers must also be emboldened by the sympathy being drummed up for them in Tamil Nadu. The DMK, the main opposition party in the state, is conducting a mass campaign on the one hand to pressurise the Government of India into adopting a sterner attitude towards the Sri Lankan government and, on the other, to embarrass the AIADMK ministry in Tamil Nadu for being silent over the Sri Lanka issue. The Government of India has to contend with, apart from domestic public opinion, especially in Tamil Nadu, the problem of Sri Lankan Tamil refugees (said to be around a lakh in number) and the hampering of Indian fishing activity in the Palk Straits that divide the two countries. A Special Advisory Group was set up by Prime Minister Rajiv Gandhi on April 25, to continue efforts to resolve the Sri Lankan tangle. But it seems to have been dormant so far.

## *United Kingdom*

### Miners Fight On

EVEN if the first round of the British miners' struggle was defeated by an array of force unprecedented in the island's history since mid-nineteenth century, the miners were not. A number of developments in quick succession in mid-May made this amply clear.

The sentence of life imprisonment given by the High Court to two young miners on May 16 was met with a walk-out by the Welsh miners on the next day. The two miners had been charged with murdering a cab driver carrying scab labour at the height of the tension during the year-long strike.

On the same day there were other developments on both sides of the class fence that revealed the continuing tensions. Two mines were closed down, on the one hand, making a few thousand workers redundant; on the other, the pit superintendents' union voted by a majority of 60 per cent for industrial action beginning with a ban on overtime.

The unfavourable outcome of the long miners' strike has not so far resulted in the loss of "the muscle power of the British trade unions", as expected by the management bosses and the Tory politicians. On May 17, London metro rail workers decided to go on a day's cease-

work on May 20 in defiance of a court injunction.

Losing some part of its self-assurance displayed after the withdrawal of the miners' strike, the Tory government is trying to augment its armoury against the workers and other recalcitrant forces. On May 17, the British Home Secretary outlined new proposals for putting further curbs on picketing, demonstrations and other forms of mass action.

While Margaret Thatcher continues to maintain the posture of an Iron Lady, events are exposing the clay at her pedestal. An opinion poll conducted by *Daily Telegraph* has revealed that the popularity of the Tory party has slumped to the third place, after the Labour Party and the Liberal-Social Democratic Alliance, in that order. Within the Tory citadel itself, the pressure group, formed and led by the sacked former Foreign Secretary, Francis Pym, epitomises the lossening of Thatcher's grip on the party itself, as much as the party's grip on the voters.

## BUSINESS

# Cotton Conundrums

THE recent public exchanges on the cotton situation between the textile industry on the one hand and interests representing cotton growers and traders on the other are, if nothing else, a good example of selective use of statistics. The textile industry has been arguing that there has been a sharp rise in the prices of cotton, reflecting a shortage of the fibre, and has on that basis sought to make out a case for import of as much as half a million bales. Growers and traders have been arguing with equal fervour that prices of cotton have in fact fallen steeply in response to a bumper crop in 1984-85 and that the government should permit export of a larger quantity of cotton than the two lakh bales released for export so far. To establish their thesis of rise in cotton prices, spokesmen of the textile industry have been pointing to the current level of prices compared to the lowest levels touched in January-February at the peak of the cotton marketing season. Those speaking for growers and traders have, on the other hand, sought to compare currrent prices of cotton with the high levels prevailing towards the very end of the last season, before cotton from the 1984-85 had begun to be marketed. So if the argument proves anything at all it is that despite the presence of the Cotton Corporation of India and the cotton marketing organisations set up by the governments of the cotton growing states, prices of cotton continue to exhibit quite marked seasonal fluctuations, so that successful speculation in cotton still remains to a considerable extent a *sine quo non* of profitable working of textile mills.

In respect of the size of the 1984-85 cotton crop and the general availability position of cotton, however, it is apparent that the textile industry is getting the worst of the argument. At the meeting of the Cotton Advisory Board in Bombay last week, while there was understandably still no agreement on the size of the 1984-85 output (despite it having been fully marketed), it could not be denied that the crop had been of a record order. Compared to the estimated production of 65.8 lakh bales of cotton in 1983-84, even the representatives of the textile industry had to admit that the 1984-85 crop could not have been less than 90 lakh bales, though the East India Cotton Association claims to have arrived at a 'final estimate' of 95 to 96 lakh bales.

This is not, however, the end of the argument about the availability of cotton to the textile industry, for there is once again no agreement on the size of the stocks of cotton carried over from the previous season—that is, the stocks at the end of August 1984. The industry claims that these were no larger than 16 lakh bales, while the cotton trade puts them at a minimum of 21 lakh bales. The trade has in fact accused the textile industry of deliberately withholding information about consumption of cotton by the mills and the level of stocks with them.

But why blame the industry? What is the elephantine bureaucracy of the Government of India's Textile Commissioner upto? The latest issue of the official *Monthly Abstract of Statistics*, published by the Central Statistical Organisation, contains in the section on 'stocks of raw materials and manufactured goods' information on stocks of raw cotton upto December 1983 only. The source of the data on cotton stocks is mentioned as the Textile Commissioner, indicating that data for the subsequent months have not been provided by that august body. Is this a case of just bureaucratic sloth or is the Textile Commissioner lending a helping hand to the stratagems of the mill-owners?

## *Sugar*

### Seeking Alibis

IN 1980-81, when the price of open market sugar shot up to Rs 15 per kg, the industry was subjected to severe public criticism and scrutiny. In the coming months, the price of sugar is bound to surge again to very high levels, unless at least an additional half million tonnes of the sweetener is imported and, more importantly, distributed effectively. But this time the private sector in the industry appears to be keen on shielding itself from criticism, and that too in advance. The Indian Sugar Mills Association, the lobby of the private mills, has been issuing press advertisements blaming faulty implementation of the sugar policy for the likely price rise.

ISMA's charge does seem to be partially true. Production in the 1984-85 sugar year, which began in October, has dropped for the second consecutive year, and is estimated to be around six million tonnes. This output and the carryover stock of 2.3 million tonnes barely covers the expected demand of about 7.6 million tonnes during the year. There are signs that the coming year's sugarcane harvest—and therefore the crystallisation of sugar—is also not going to be much larger because of inadequate winter rains. Hence a strong environment of scarcity prevails for the commodity.

The situation in respect of the availability of sugar in the open market is worse. In terms of the formal policy, 65 per cent of the output of each mill is handed over to the government as levy quota, while the rest is sold in the open market. The Lok Sabha election of December 1984 and the state assembly polls of March 1985, apparently led the Union government to change the allocation ratio. Any slight reduction in open market supplies, due to policy or some bottleneck, immediately leads to a spurt in the price. One such jump occurred some weeks before the parliamentary poll, so unnerving the government that it threatened penal action against some of the mills. The government has also been ordering much larger releases of free sale sugar than the amount sold through the public distribution system in its attempt to contain the open market price. For instance, in the current month, a release of

0.36 million tonnes as free sale and 0.31 million tonnes as levy sale has been ordered. The ISMA advertisements mention that as much as 75 per cent of the free sale quota of this sugar year had been already released in the first half, i e, by March end. The demand for free sale sugar is bound to rise during the festival season, August-November. Some more quantities of sugar would need to be imported, in addition to the one million tonnes already contracted for, to ease the supply situation. In 1980-81, however, sizeable imports did not dampen the price because they were mostly cornered by bulk consumers, who are probably speculators too.

The ISMA in its zeal to avoid one kind of criticism is weakening some of its other claims though. Its advertisements also claim that the industry has run into losses for three consecutive years largely because of having to subsidise levy sale sugar. But the government ordering the release of a much larger quantity of free sale sugar should have financially benefited the mills. Both the unit value realisation and total returns must be higher because of the larger free sale releases in a situation of scarcity.

## *Industry*

### Take-over with Junk Bonds

HOW are take-over bids worked out? One would imagine that a party planning to take over a company first tries to corner, as stealthily as possible, a good proportion of such a company's voting stock through market operations. Once a party has cornered a certain proportion of the company's stock, it makes an open bid for the company's shares. Usually the open bid is far above the ruling price of the company's shares.

The take-over game is an old one and is played all over. In the US, however, an interesting aspect of recent take-over bids—as distinguished from actual take-overs, and this distinction is important to bear in mind—is that for the credibility of their open bids, the parties making the bids conjure up with the help of financial houses schemes of financing the purchases of shares at the fancy prices offered in such open take-over bids. To take a concrete case, recently a relatively small broadcasting company which had made a name in cable television, Turner Broadcasting, made a bid for the second largest private communication network, Columbia Broadcasting Station, generally known as CBS, by offering to buy the CBS shares at $ 175 apiece as against the going market price of close to $ 110. At this price, Turner Broadcasting ought to be ready to pay up $ 5.4 billion.

What it has offered to do is to give the holders of CBS shares a package consisting partly no doubt of shares in Turner Brodcasting but largely of what have come to be termed as 'junk bonds'. These bonds are high yield IOUs to be issued by the company when it is taken over and merged on the strength of its assets. In this particular case, the shareholders of CBS are being offered in exchange for their existing shares such bonds which though high-yielding are based on the assets of the CBS and these assets naturally cannot be higher than they were before the take-over, if the liabilities created through the bonds meant to pay the inflated share prices are set off against whatever assets the company held.

Often the bidders don't succeed in their take-over attempts. Often they don't even mean their bids seriously, because there is gain to be made from just making the bid. Once you succeed in establishing the credibility of your bid, those currently in control will try to buy you out and you make a handsome gain. Indeed there are persons in the US who seem to specialise in just such bids and make millions in the process. But who carries the burden of these take-over bids? None other than the company under attack, regardless of whether the bid succeeds or it does not.

When all this is allowed to happen in the name of efficiency, isn't one entitled to ask what exactly is meant by efficiency?

## LETTERS TO EDITOR

### Terrorising the Civil Rights Movement

AT 10 a m on May 16 K Balagopal, general secretary, APCLC, was assaulted by Akhil Bharatiya Vidyarthi Parishad (ABVP) hoodlums at Jagityal bus stand. Shankar, an advocate from Laxsettipeta, who was accompanying him was also injured.

Balagopal and Shankar had gone to meet Revenue Divisional Officer (RDO), Jagityal, in connection with the magisterial enquiry in progress on the 'encounter' killings at Kondapur. On April 11 five alleged Naxalites were killed in an 'encounter' at Kondapur, Siricilla taluq, Karimnagar district. Both APCLC investigations and independent press reports have established that the five persons were killed in a cold blooded manner and that no 'encounter' took place. Subsequently the AP government ordered a magisterial enquiry into the incident and RDO, Jagityal, was assigned the job. But the enquiry turned out to be as stage-managed as the encounter itself. Hundreds of armed police surrounded the area and prevented even the press, leave alone the people, from attending it. None of the forty 'elders of the area' who spoke to the magistrate spoke about the encounter, while two of the parents of the deceased who spoke to both to the APCLC team and to the press were prevented from attending the enquiry.

It may not be out of place to mention here that there has been a sudden spurt in 'encounter' killings in Andhra Pradesh. Since January so far 14 alleged Naxalites have been killed in six 'encounters'. In addition, eight people have been killed in police custody, one of which is a case of a political activist, while three people have been killed in unprovoked police firing. This makes a total of 25 arbitrary killing by the law enforcing authorities in a span of four and half months.

It is against this background that Balagopal and Shankar went to meet the RDO, Jagityal. They returned to the bus stand around 10 a m. While they were standing at the bus stand, they were attacked by a group of known ABVP hoodlums with steel chains and sticks. That the ABVP has become a kind of private army of the police, especially in Karimnagar district, is by now a well recorded fact. On January 12 Gopi Rajanna, a young APCLC advocate, was killed by them. Although APCLC has submitted a list of persons who killed him, so far no action was taken against them.

In the assault, Balagopal received head injuries and was also hit in abdomen. Shankar received minor injuries. Both of them managed to reach a hospital. Later a complaint was also lodged with the police. Presently Balagopal is in Warangal and is out of danger.

Threats, intimidation, arrests, illegal detention, false cases and physical assaults are part of a mounting attack on civil right activists in Andhra Pradesh. This attempt to terrorise and silence the civil rights movement is in fact an attempt to suppress the spread of information about assaults on democratic rights of ordinary people.

M KODANDARAMA REDDY
Joint Secretary,
APCLC, Hyderabad

## CPI(M) Never Blames Its Cadres

I WAS surprised to go through the piece of comment entitled "The CPI(M): Blaming the Cadres" (April 27).

Firstly, I never used words like 'step-motherly' or 'discrimination' in my writings and speeches. I meticulously use the word 'injustice' of the Central Congress(I) government towards the State of West Bengal. This they do on political grounds. We are vehemently in opposition to the Congress(I) rulers at the Centre and their anti-people political and economic policies. And the rulers at Delhi too do not want the democratic process we have unleashed in the political, economic and social life of our state. This is the cause of their injustice regarding allotment of financial share, setting up of industries, etc, in West Bengal.

Secondly, I never said that the cadres are to be blamed for our adverse results in Lok Sabha elections on certain areas. I said: it is due to the failure of the leadership at the state, district, zonal and local level to educate properly the cadres who have to politically reply to the Congress attacks. Rather I defended our cadres by refuting the view that our party and the cadres are getting 'isolated' from the people. I said: our cadres do not live in the skies, they live among the people and they and the party are not isolated from the people, but they are not equipped to properly answer the political questions.

Thirdly, I have been associated with the party leadership since 1931, at all the phases and during all the turns and twists. Our party has never been in the habit of "passing the buck, so to say, to the cadres lower down—an old tradition of the Indian Communist movement". Our party never says: Leadership is always politically correct and all the failures of the party are due to the shortcomings of the cadres. We never hesitated to make self-criticism openly whenever we had gone wrong. Criticism and self-criticism is the main principle which we pursue for the development of our party. Your correspondent has quoted something from Ajoy Ghosh in 1952. We have to check it up. It might have been quoted out of context. The fact is: our party always tries to develop the cadres ideologically and politically and this system of party education should not be put in a distorted form.

Lastly, I have been advised to undertake a deep introspection. The writer should know that after thorough discussion our party at the Central as well as the state level has adopted the Lok Sabha election review and we are going ahead with the tasks that followed from it.

SAROJ MUKHERJEE

West Bengal State Committee,
CPI(M), Calcutta.

## Sahebganj Massacre of the Poor

THE following is the report of Uma Shankar Shukla, Secretary, MCC, and Shiba Mahto, MLA, JMM, who visited the place where 15 adivasis were killed in police firing near Sahebganj on April 19. Though the report does not indicate how Father Anthony Murmu was killed after arrest, other evidence indicates how he was beaten to death in custody and then shot to make out that he had died in police firing, being in the mob. This is the worst part of the whole dastardly crime and warrants nothing short of immediate arrest of the total police party there under 302 IPC, as in the case of the murder of Bhim Singh in Rajasthan.

Village Banji is situated ten kilometres from Sahebganj. There is no transport to this village. The only bus that used to go to Banji bazaar was of the State Transport Corporation and that too is off the road these days. Not even a rickshaw goes to this village now. An atmosphere of terror and distrust is prevailing in the entire area. Any discussion of Banji incident silences the people.

We contacted the Deputy Commissioner of Sahebganj district, Bhagambar Prasad, and questioned him about the incident of April 19. He replied that the government had ordered a judicial enquiry and that he himself had formed a peace committee in Banji village. He also informed us that the Opposition leader Karpoori Thakur had gone to Banji and had not returned yet. When we explained to him our difficulty in transport he provided us with a jeep to go to the village. At 8.15 am we started for Banji, Sahebganj.

At Banji Santhal we went to the house of the late ex-MP Father Anthony Murmu and met his wife Bibiana Baskey and their four-year old son Clement Murmu. The villagers also had collected there and Karpoori Thakur was conducting his inquiry. As we reached he had closed his inquiry and was returning. We also met the village pradhan Raven Murmu and had talks with other people in the village. The pervading atmosphere is one of terror and distrust. From the inquiry we came to know that on April 19 at 8 O'clock in the morning some tribals from Banji Santhal had gone to Banji to bring firewood. While they were returning some goondas of the Mahajans fired at them thrice though nobody was wounded. The news of the firing spread among the villagers and they were agitated. The people of Banji Santhal collected the tribals of the area by beating the drums. The crowd got together and decided that a delegation under the leadership of Father Anthony Murmu, ex-MP, would meet the SDO and the DSP, camping at the government rest house to find out why tribals were fired at.

Five persons, Father Anthony Murmu, Babulal Soren, Madan Manjhi, Jeta Murmu and Badka Murmu went ahead to meet the SDO and the crowd followed them. The police took Father Murmu and Madan Manjhi into custody and opened fire on the crowd in which fifteen people died and nineteen were seriously wounded.

The tribals are smouldering under the exploitation of the Mahajans. There is a huge tank near Banji bazaar. It is the tradition among the tribals of the area to go fishing in this tank every year after the Holi festival. But for the past three-four years the government has auctioned out this tank to non-tribals whose sole aim is profit-making. Thus traditional rights of the tribals are being snatched from them. This year one Moti Bhagat, a timber contractor, has the tank on auction. On March 25 last a quarrel broke out between the tribals and the contractor on the question of fishing rights and on the same day the body of Matku Murmu of village Saboya was found floating in the tank. This incident triggered off tension and anger in the entire tribal area. The tribals suspected the hand of the contractor in the death of Matku Murmu.

On the question of collecting firewood, flowers and fruits, etc, also there exists constant tension between the tribals and the forest department. People report that the police and the authorities have been bribed by the Mahajans and at their instance wanted to teach the tribals a lesson and fired on them killing fifteen and wounding nineteen.

The dead body of Father Anthony Murmu was not handed over to his wife but to a cousin of his who is a government employee in Bhagalpur. The news of Father Murmu's death was communicated to his wife only on April 21.

The main question is not tribals *versus* non-tribals but is a question of Mahajan and the police *versus* oppressed people. Vested interests along with the authorities are trying to paint it otherwise. The tribals and all justice loving people demand that just punishment be meted out to the guilty police officials.

Dhanbad. A K ROY

# Today's Congressiahs

### Romesh Thapar

WHEN Rajiv Gandhi moved into his mother's office, he inherited a lumpenised, criminalised party and little else. All the computer antics during the parliamentary and assembly elections were not able to make much difference to the composition of this party and its election candidates. And only the other day, at the first AICC meeting since the traumas of last year, the members mobbed their 'leader' in such fashion that he had to abandon his lunch and flee. No charisma was involved. Arun Singh, his political aide, had to flee too.

This incident captures the spirit of the Congressiah today. He is an incurable psychophant, interested only in the politics of making money at whatever level offered to him. Meanwhile, the mounting resentment among party dadas against Rajiv Gandhi, widely expressed in private, is significantly around his 'inaccessibility' —whatever that might meant!—and this is contrasted with his mother's ability to dabble in political gossip and to intrigue actively and skilfully among the factions manoeuvring for her favours.

Rajiv Gandhi's hold on the party remains tentative, uncertain. He has no stomach for pressurising and dragooning, but he also lacks the capacity to resist pressures which are, more often than not, contrary and confusing. At the AICC, the call for political and economic change was considerably modified. We are, alas, back to empty chatter about 'socialist paths' and the 'leading role' of the public sector. All this certainly means that there is some accessibility, and of the wooden-headed kind.

The inability of the Congressiahs to think beyond the unrewarding ideological cliches of the past and to move towards the disciplines and perspectives of a just society for India, where the rich just cannot indulge themselves and where the poor are helped to become productive, is sharply highlighted in the AICC's listless and cynical ramblings on economic policy. As expected, the whole complicated issue was seen as a 'rightist' thrust encircled by a 'leftist' pincer movement. Where these elements are now, goodness knows. Maybe, our editors of the national press will tell us one day.

The confusion in the mind of today's Congressiah, including the 'leader', is best seen in the preparations to begin a year-long celebration of the centenary of the freedom struggle and of the Indian National Congress that led the people. This event has been literally grabbed by the Congressiahs of today who have nothing in common with those who forged the movement for freedom.

Everything got off to a wrong start. There was no proper consultation among a variety of people once associated closely with the morchas that fought for freedom. To invite them belatedly for the inauguration of the festivities (carefully and consciously synchronised with the birthday of none other than Motilal Nehru!) is to ask for the rebuff that was delivered. Rajiv Gandhi was insensitive, to say the least, and particularly after his rather shoddy and unforgivable attacks on the patriotism of so many distinguished members of the Opposition who were building the Indian National Congress before he was born.

It is a commentary on the servile condition of the so-called 'national' press that no one had the savvy to urge in the early stages a more dignified observance of the centenary on a non-party level. To say so now is meaningless. The Congress(I)—put whatever clothing on it, khadi or polyester, white cap or black—is not any more seen as the vanguard of the freedom struggle by 50 per cent of the people who voted against it, and perhaps even by a fair percentage of those who voted for it in the absence of any other viable all-India alternative. All the lyrical praise of the Congress Party cannot dissolve these truths.

And these truths will have to be digested before some degree of health is restored to our democratic functioning, or else every collision will become destructive. The Gujarat holocaust is the latest example. It was triggered, let it not be forgotten, by the Congress(I). It was exploited certainly by the BJP and the RSS. To dismiss it as another example of Opposition disruption is to invite ridicule, despite the easy PR play of Akashvani and Doordarshan. We have cause to be deeply worried by the implications of such dishonest politicking.

At this level of provocation, the ruling party may well spark the kind of angers which convince the Opposition formations to stage parallel and competing anniversary demonstrations around the centenary in all the capitals of the subcontinent. There is ample muscle and clout available to do this in the regions surrounding the backward, Hindi-speaking heartlands, and to give the rickety Congress machine a rude shaking. Let us always remember that our parties are masters of irrelevant politicking because they are fearful of tackling the real problems which are paralysing our polity.

Rajiv Gandhi is taking a long time to learn that as Prime Minister he is not a mere Congress leader, that there is more to rulership in our complex, contrary land than making speeches which speak hopefully of change and progress. Even the ghost-writers are showing signs of exhaustion. That is why various phrases have to be interpreted and re-interpreted by various official spokesmen. However, the Congressiah of today doesn't care what is said to him so long as he is permitted his criminalities. That is Rajiv Gandhi's crisis—to establish control over this creature or to replace him/her with persons who think about their land. Makhanlal Fohtedar in the Rajya Sabha is no answer. He must search wider for potential Congressmen made in the mould of the founding fathers. That should keep him busy.

And so, from day to day, the euphoria around Rajiv Gandhi is losing its assertive presence. It is still felt that he needs more time, but already there is anxiety about whether he knows what to do, and whether the correctives so far announced will work. Unless he can get a firm grip over his party and his policies, he will not be able to deal effectively with the many unresolved problems of the sub-continent now surfacing all together. Political drift usually creates this kind of complication, but for the Indian polity it is extremely dangerous. New caste and ethnic tensions are threatening.

Surely, at this juncture, Rajiv Gandhi and those around him cannot possibly rest content with the thought that their Congress is 'the political Ganga of the nation'. The Ganga is dirty and polluted. Indeed, only the other day, an unsuspecting tourist boating past the historic ghats at Varanasi, dipped her hand into this filthy river and came out with a hand! The Congress hand . . .

Amusing? Not really. In the *kedgeree* that is the Congress today, there is every reason to suspect the quiet crystallisation of another 'Syndicate'. It is not like the one confronted by Indira Gandhi. More motley, but disruptive of this easily factionalised party. And more active, because the 'leader' is unclear about how to lead.

# The Relationship That Was

### GPD

RAJIV GANDHI's trip to Moscow has an obvious significance. It is his first trip abroad as Prime Minister. At one time it looked as if the Soviets had scored a major diplomatic point by making sure that the new Prime Minister of India travels to Moscow before he goes anywhere else. Since the visit to the US was bound to be on his agenda, the Soviets could have asked for nothing better than Rajiv Gandhi agreeing to go to Moscow first. The Soviets also tried to consolidate their advantage in New Delhi by promptly and quickly responding positively to the appeal issued by the non-aligned (from New Delhi) on the question of peace and weapons and so on. Responding positively to appeals issued from New Delhi should be one of the easiest things to do. Most of them are finely worded, but of little practical significance. Even so the Soviets response mattered. In short, the stage was set for Rajiv Gandhi's successful visit to the Soviet Union. It looked as if a near-euphoric stage in Indo-Soviet relations was about to be reached.

All that seems to be an ancient story today. Rajiv Gandhi's government is barely six months old. But it seems to be almost a decade ago that the Soviets enjoyed the advantage that they did. Within a brief period of about three years of Rajiv Gandhi's appearance on the political scene, he and his men have taken India on to a path which it had never traversed before. It is doubtful if the Soviet Union had foreseen a major shift in India's foreign and, more importantly, foreign economic policies. For the first time Soviet policy-makers must have realised that the context of Indo-Soviet relations has changed. It is going to change even further.

The overworked cliche of Indian foreign policy rhetoric is the 'tilt' that Indian foreign policy is supposed to have always exhibited. Indira Gandhi had coined her own counter-cliche. She had claimed that there was no tilt in India's foreign policy. It stood erect, right in the centre. The business of tilt was never meaningful. Consequently Indira Gandhi's assassination was not meaningful either. The debate on 'tilt' was a bit like the debate on 'genuine non-alignment'. We as a people get so lost in making short, crisp formulations on everything, let alone foreign policy, that in our eyes words *become* reality rather than being used to describe it. Indian foreign policy is easily the worst victim of this pastime of our national elite. A part of the reason for this is our reluctance to see the interrelationships between foreign policy and foreign economic policy. This must be the first time that the close relation between budget and foreign policy is being slowly perceived. There is a new economic policy. There has to be a new foreign policy. Some adjustments would be necessary. When the Soviet Union invited Rajiv Gandhi the changing context of India's foreign policy had not become explicit. The budget showed that the Nehru era had ended. There will still be many Nehru-like elements in our domestic and foreign policies. But they would be more in the nature of survivals of history. India is no Egypt, not yet that is, where the change has to be total and sudden. Nor is it necessary for India to translate change as break. But the change is unmistakably there. For the first time, an Indian Prime Minister goes to Moscow in much the same way as he would to any other capital in the world.

The assassination of Indira Gandhi, the rising terrorism and the clear western support to that terrorism have not produced in Delhi the kind of effect it would have even in a much less independent Latin American country. Whether one attributes this to the sophistication of our elite or to the success of destabilisation policies being relentlessly pursued by a consortium of powers, the fact remains that the Indian elite is not an angry elite. The people are. The elite is not. That no significant anti-west demonstrations have taken place in India since October would tell a story the full implications of which are not yet clear. But whatever they are, they cannot be much to the liking of the Soviet Union. The FBI stories on the arrest of some terrorists and the prompt vote of thanks proposed by the Government of India are perhaps the best examples of black humour in international politics. It seems to have escaped our policy-makers that the FBI disclosures tell a story which has disastrous implications. It tells a story of a leadership caught in a helpless, humiliating situation. More likely the latter. If this is so then what appears to have escaped our policy-makers turns out to be self-imposed ignorance as a defence mechanism. At no stage in our history was India's foreign policy in such a pathetic state. This is the changed context of the Indian Prime Minister's Moscow visit. An era is drawing to a close.

This does not mean that any disasters are imminent. We shall more likely have them on the domestic front than in international affairs. One thing seems very clear though: for nearly four decades the relationship with the Soviet Union was in many ways a primary relationship in India's foreign policy world; it seems likely that it would lose that status now. It would be an important relationship but one of the four or five important relationships, not the least among them being the Indo-American relationship.

## APPOINTMENT

**Institute of Development Studies, Jaipur**

The Institute of Development Studies, Jaipur, proposes to recruit additional research staff, trained basically in Social Science, preferably interdisciplinary in approach and with some understanding of the role that Science and Technology can play in the processes of development with particular reference to Rajasthan.

Applications are invited by 30th June, 1985, in the prescribed form available from the Institute's office (B-118, Mangal Marg, Bapu Nagar, Jaipur - 302015) on prepayment of Rs. 4/- (Rs. 4/- extra in case required by post) for the posts of Fellow (Rs. 1200-50-1300-60-1900) and Associate Fellow (Rs. 700-40-1100-50-1600) with usual benefits of P.F., gratuity, medical, etc. admissible as per University of Rajasthan rules.

# No Remedies against Police Torture?

### AG Noorani

HOW long will the Indian legal system remain without any worthwhile remedies against the practice of torture by the custodians of law and order against the hapless citizen? The existing remedies are worse than useless—the civil suit for damages which entails payment of heavy court fees, endless delays and quibbles over notice; the criminal prosecution which is about as difficult and almost as slow.

All this in a country where not a day passes without the press reporting police barbarity in some parts of the country or the other. The *Hindustan Times* of May 13 carries a report from Bhopal which says that a young undertrial who died in Damoh jail recently "was reported to have been beaten up by the police after he was picked up from the bus stand and taken to the police station on vague charges under Section 109 Cr PC. The post-mortem report did not specify the cause of death".

Such reports are fairly common these days. The *Indian Express* of May 3 published a report from Amritsar of a former MLA, Harbans Singh, seeking permission from the government to launch criminal prosecution against police officials for the alleged torture of his two sons. This is a result of the sanction provisions in Section 197 of the Code of Criminal Procedure!

One would have thought that since such abuses are the norm, the legal fraternity would have mounted a campaign for effective remedies against them. In view of the conditions in our country a legal remedy to be worthwhile must be inexpensive, speedy, and adequate, both in its punitive and compensative aspects. It must not only punish the wrongdoer but also compensate the victim. The wrongdoer as well as his employer, the State, must be made to pay. After all, the State does tacitly approve of torture. Had not Zail Singh endorsed the use of third degree methods in the course of a press interview in January 1981 when he was Union Home Minister? That apart, it is State employment and State power which enables the perpetuation of wrong.

Even in a country like Britain where public awareness is much greater and legal remedies more effective—both suits and prosecutions are easier to launch than in India—a special remedy has been provided by statute to deal with complaints against the police.

The Police and Criminal Evidence Act, 1984, establishes the Police Complaints Authority. It consists of a Chairman and not less than eight other members. It can set up regional offices as well. Ordinarily complaints against the police are investigated by the Commissioner of Police of the Metropolis or the police authority for the force's area. But they are now bound to refer to the Police Complaints Authority "any complaint alleging that the conduct complained of resulted in the death of or a serious injury to some other person". Other referrable complaints are also mentioned in the Act. In plain words, complaints of torture resulting in death or serious injury must be referred to the PCA. This is in addition to the PCA's power to direct the police authorities to submit to them any complaint not referred to them. The widest scope for reference of complaints by the police authorities is provided in the Act.

The PCA supervises the investigation of the complaint and can direct reference to the matter to the Director of Public Prosecutions. It will submit at the end of each calendar year a report to the Secretary of State for Home which will be laid before Parliament.

The Police Complaints Board set up by the Police Act, 1976, is abolished and the Act is repealed by the Act of 1984. These institutions are not to be copied but studied for suitable adaptation in our conditions. For one thing we do not have an independent Director of Public Prosecutions. Why, no one even talks of a Lok Pal, the national Ombudsman. The Lok Ayuktas in the states are not exactly shining examples of success. Their very existence is little known.

It is the principle of independent examination of complaints against the police which is important. A panel of independent persons of which a retired IGP is also a member can be set up to receive and supervise the investigation of complaints of torture by the police. Its very establishment will deter the police.

As for the familiar plea that false and vexatious complaints will be filed, it will be open to the panel to insist on sworn statements and prosecute for perjury those who lodge false complaints. Additionally the panel can itself impose a fine on the vexatious and dishonest complainant.

Which brings one to the heart of the matter—the powers of the Police Complaints Authority. Why not empower it to inflict punishment on the policemen it finds guilty instead of referring the matter to the courts for another go?

It is the speed and accessibility of the body which matter most besides, of course, its independence and integrity. Ours is a poor country. The people who suffer most at the hands of the police are the poor and the uneducated. A Police Complaints Authority will be successful or worthwhile only insofar as it answers their needs. And that is a test not for this institution alone.

APPOINTMENTS

**WANTED**

A reliable company of north India requires the services of some experienced sales representative to sell their household and domestic article of daily need. Salary Rs. 1,000 plus commission and other benefits extra. A self stamped envelop must be accompanied. Apply in English or Hindi only to:

**SHIVALIK ENTERPRISES**
5574-A, New Handrawal,
Kamla Nagar, DELHI - 110 007

# Entertainment Electronics Bonanza

**Hansavivek**

*PEICO ELECTRONICS AND ELECTRICALS* has recorded an impressive recovery in its financial performance from the previous year's setback. Its gross profit has jumped from Rs 8.24 crore to Rs 15.55 crore following increase in turnover from Rs 164.85 crore to Rs 209.49 crore, reflecting a sizeable increase in margins. Net profit is also considerably higher at Rs 4.64 crore against Rs 1.72 crore despite higher provisions for depreciation and taxation. Dividend has been stepped up four points to 20 per cent and is covered 1.07 times; half of last year's distribution was short-earned.

The company has further accelerated the programme of modernisation of its various factories. The lighting division introduced low pressure sodium vapour lamps, energy effective 26 mm slimline TLD fluorescent lamps, low wattage high pressure SON sodium vapour lamps as well as coloured compatulux reflector lamps. The availability of lamps and lamp components from the Kalwa factory near Bombay was adversely affected due to disturbed industrial relations. The company had to increase procurement of lamps to meet consumer demand. The letter of intent for the manufacture of 15 million glass shells at the Kalwa factory was converted into an industrial licence. Preparations for its implementation are in hand. In the field of projects, the company received orders from several major thermal power stations and also a contract for the prestigious Calcutta Metro Railway for design, supply and installation of lighting systems. The company made an entry into the television market with the introduction of three models of black and white television receivers in 12″, 14″ and 20″ screen sizes. It has now finalised plans for extending the range and improving volumes. A high performance cassette deck was added to the range, while successful entry in the car audio and stereo audio recorder was made. In pursuance of the long-term growth objective, a new audio complex is being put up in the Salt Lake area of Calcutta.

The company also successfully completed its export obligation in radio receivers. It has received a letter of intent for the manufacture of an additional one million audio products (radios-recorders-combinations) covering both the Pune and Calcutta factories. The letter of intent carries with it an export obligation. The company has received an industrial licence for the manufacture of one million micromotors which together with the tape deck mechanism are being implemented at the new Salt Lake factory. It has also secured letters of intent for magnetic heads, hard ferrites, loudspeaker cones and component parts of loudspeakers, ceramic capacitors, as well as coloured television receivers. Steps to implement these various letters of intent are well in hand. The company has obtained industrial licence for the manufacture of ultrasound diagnostic instruments and letters of intent for x-ray diagnostic systems, liquid nitrogen plants, high speed character printers, mini floppy disc drives and electronic keyboards. Besides, a number of the company's applications are pending with the government for grant of licences to produce electronic PABX, electronic telephone instruments, teleprinters, modems, analytical instruments as well as laservision systems. The company has been preparing itself to handle in a professional way its entry in the field of data systems, particularly in the areas covering testing, installation, service and software. To strengthen its commercial organisation, the company opened a branch office at Chandigarh and inaugurated three new show shops at Madras, Bombay and Chandigarh to enable consumers to examine and see demonstrations of the wide range of the company's products. Webel Telecommunication Industries, in which the company holds 40 per cent share capital, made a profit of Rs 40 lakh for the year ended March 1984 and declared a dividend of 10 per cent.

*ZUARI AGRO CHEMICALS* is further diversifying its activities into cement and shipping. It expects to receive a letter of intent for setting up a one million tonnes per annum cement plant at Mandalgarh in Rajasthan. A detailed feasibility report based on the results of limestone prospecting in Mandalgarh is being prepared. The company's efforts to acquire a bulk carrier for the transportation of phosphoric acid consumed by it and other Indian fertiliser manufacturers have made good pro-

gress. Subject to government's approval, it plans to purchase one phosphoric acid carrier of a suitable tonnage during this year. The company is also exploring the possibility of entering high technology areas for the manufacture of electronic telecommunications equipment. Meanwhile, the company commissioned recently its di ammonium phosphate project. The completion of the project in record time has enabled the company to double its production of vitally needed phosphatic fertilisers. The company has got a letter of intent to put up a 1,350 tonnes per day ammonia plant and 2,250 tonnes per day urea plant based on off-shore gas at Sawai Madhopur in Rajasthan. Work on this Rs 750 crore fertiliser project has already been initiated.

The company has produced good results for 1984. The plant performance was significantly better than the previous year with capacity utilisation of ammonia and urea plants reaching 90 per cent and 94 per cent compared to 83 per cent and 86 per cent, respectively, in 1983. The capacity utilisation of the NPK plant in terms of tonnage at 106 per cent was marginally lower than in the previous year due to industrial relations problem in respect of contract labour towards the year end. With sales amounting to Rs 151.43 crore against Rs 137.58 crore of 1983, the company earned a gross profit of Rs 21.90 crore against Rs 15.81 crore, reflecting a notable increase in profit margins. Net profit has more than doubled to Rs 10.49 crore (Rs 4.94 crore). Dividend has been stepped up by 2.5 per cent to 22.5 per cent and is still covered 3.63 times by earnings as against 1.82 times previously. The company's shareholders in their meetings held in March last have approved to extend the due date of redemption of 4,12,490 cumulative redeemable preference shares to July 10, 1992 or thereafter but not later than July 10, 1995 and also to increase the rate of dividend payable thereon from 9.5 per cent per annum to 15 per cent per annum, or such higher rates as may be fixed by the Central government from time to time.

*MAFATLAL DYES AND CHEMICALS* has earned a lower gross profit of Rs 246 lakh in 1984 against Rs 315 lakh in the previous year following a drop in turnover from Rs 91.15 crore to Rs 35.21 crore. These figures show that margins have increased. Net profit is lower at Rs 98 lakh against Rs 104 lakh, but dividend is maintained at 17 per cent which is covered 2.28 times as against 2.42 times previously. This outcome is to be viewed against the background of important changes which took place in the company's business. Unlike in the previous year, the company did not market during 1984 high density polyethylene, refrigerants and propellants and certain dyestuffs, as the manufacturers of these products had terminated their marketing arrangements with the company. The arrangements for booking indent orders for certain goods manufactured by Hoechst of West Germany and its associate companies also stood terminated. The company undertook extensive marketing of dyestuffs, pigments and optical brighteners manufactured by Indian Dyestuff Industries (IDI). Total sales of IDI products amounted to Rs 25.27 crore. Production of synthetic resin dispersions was 3,524 tonnes, reflecting an increase of 11 per cent over the previous year. Sales at Rs 9.87 crore showed an increase of about 15 per cent. The company continued to act as an indenting agent for 'FUTURA' polyester staple fibre manufactured by Indian Organic Chemicals. Indent orders booked during 1984 amounted to Rs 5.77 crore. A year ago, the directors had expected the company to achieve an ex-stock turnover of Rs 30 crore, whereas the actual ex-stock turnover in 1984 has exceeded Rs 38 crore. In view of the anticipated reduction in business, the company took appropriate steps to reduce establishment expenses wherever possible. Considering the ex-stock turnover of over Rs 38 crore, the profit before tax of Rs 235 lakh can be considered to be satisfactory. Profit after tax at Rs 98 lakh showed a marginal decline of about 5 per cent over that of the previous year. Stringent monetary conditions, high rates of interest, continuing inflation and recessionary conditions in the textile industry have exerted considerable pressure on the company's finances. Nevertheless, the financial position is quite satisfactory.

*BHARAT HEAVY ELECTRICALS (BHEL)* achieved an impressive performance during 1984-85, with a turnover of Rs 1,542 crore against Rs 1,325 crore in the previous year, and profit reaching the Rs 100-crore mark, according to preliminary figures. The company received its biggest-ever turnkey contract valued at Rs 470 crore for three units of 210 MW each at the Kolaghat thermal power plant in West Bengal. With this, BHEL's order book stands at over Rs 5,000 crore. BHEL thermal sets exceeded the generation targets for the year fixed by the Central Electricity Authority and generated 61,900 million units against the target of 60,700 million units, representing a 25 per cent increase over the previous year. BHEL's 210 MW thermal set at Vijayawada-II operated uninterruptedly with 100 per cent availability for over four months at a stretch. Over a dozen more such sets operated with 100 per cent availability for periods exceeding 60 days. A Rs 3.8 crore heavy equipment repair plant is being set up near Varanasi to provide prompt repairs and spares in the eastern and north-eastern regions.

BHEL joined the select band of top four power equipment manufacturers in the world by developing a new ignition system known as 'Direct Ignition of Pulverised Coal'. This system will result in a 90 per cent saving of fuel-oil in coal based thermal power plants. Installation of this system in existing boilers will result in fuel savings of about Rs 400 crore per year. A five MW Magneto Hydro Dynamics (MHD) experimental test facility reached final stages of commissioning at Tiruchi. This is a new and more efficient method of generation of power. R and D expenditure of Rs 39 crore is planned for 1985-86, which works out to 2.2 per cent of the turnover. The company manufactured 12 oil drilling rigs in the year. Orders worth Rs 100 crore were received from ONGC and OIL for 13 rigs and 100 sets of well-head and X-Mas Tree valves used in drilling operations. India's first underground Metro Train has been equipped with BHEL traction equipment. A proposal for introduction of BHEL Trolley Bus in Delhi is under examination of the government. The Rs 100 crore turnkey power plant set up by BHEL in Libya was finally handed over after four years of successful operation and maintenance. A 132 KV substation in Phillipines, a 66 MW turnkey hydro project at Tenom Pangi (Malaysia) and a 121 MW hydrogenerator for Bhumibol (Thailand) were also handed over to the customers. New contracts were bagged for maintenance of boilers in Malaysia, consultancy for setting up a piping plant in Algeria and manufacturing facilities for mini-micro hydel sets in Nepal. The company secured an entry into the USSR market by bagging a Rs 5 crore contract for Cone Crushers and Haulage Winches. Three plants of BHEL received the coveted International 'Sword of Honour', for safety, awarded by the British Safety Council. Two plants of BHEL were the recepients of national awards for best performance in productivity. A Rs 5 crore Pollution Control Research Institute is being set up at Hardwar with UNDP assistance to develop new technologies for prevention of air, water, noise, and solid waste pollution. Setting up of 100 integrated rural energy projects valued at Rs 7 crore for installation of solar, wind and bio-gas systems in remote areas has been entrusted to BHEL by the Department of Non-Conventional Energy Sources. Six such projects have been completed.

## IMPORT POLICY

# Search for Instant Growth

### Arun Goyal

THE three-year import policy announced in April this year continues the liberalisation trend which began eight years ago when the Janata government came to power at the Centre. The first wave started in 1978-79 following the Alexander Committee's report and a comfortable exchange reserves position as a result of remittances of Indian workers in Gulf countries. The IMF loan conditionalities forced the next major liberalisation in the 1982-83 policy. The Open General Licence (OGL) lists for both capital goods and raw materials were expanded with the backing of the IMF's Extended Fund Facility. Unlike the earlier waves, the third major liberalisation, announced in the 1985-86 policy, lacks a favourable context.

The outlook for balance of payments is bleak. The inflow of remittances from Indian workers abroad is decelerating, the strong dollar takes funds out of the country since imports exceed exports by a factor of 1.6. Prospects of self-sufficiency in oil are poor with insignificant additions to reserves from exploration operations. Last, the SDR 3.9 bn loan from the IMF is nearing maturity.

The policy-makers must have chosen the high risk policy of liberalisation in the hope of some immediate gain to the economy. This decision follows the 1985-86 Budget and its record uncovered deficit. Imports are made easier with the scrapping of automatic licensing (this category covered the raw material needs of industrial Actual Users) and the shifting of 778 new items to the OGL list (see Table 1). The Automatic Permissible list of 512 items to cover imports against the automatic licences has also been dropped from the policy book and 91 per cent of the items have been moved to the OGL list. Apart from the shifting of electronic components and sub-systems from the canalised list into OGL, a number of automotive and electronics industry components have been put on OGL for the first time.

The scrapping of Automatic Licensing removes some of the administrative hurdles in importing. The value of imports may not go up very much since the Automatic Licence was almost as liberal as the Open General Licence. The liberalisations for the automotive and electronics industry are important since they mark the continuation of the government's policy to 'encourage' these industries through concessions in import licensing and customs tariffs to achieve modernisation and cost reduction. In practice, the policy has led to CKD and SKD imports for assembly into finished goods. In the automotive industry, assembly type production has reached down to even subsystems such as fuel injection pumps.

The intention to liberalise procedures through abolition of Automatic Licensing has been welcomed by industry associations in press statements. Privately, however, leaders of industry claim that the import policy continues to be restrictive in implementation and interpretation. Total lack of co-ordination between the DGTD and the licensing and customs departments is said to hamstring operations. Short of a major structural change, the policy cannot be liberalised in practical terms. Computers are quoted as an example. The OGL imports allowed in this year's policy will not come to much because the configuration specified is such that few will find it profitable to effect imports. Moreover, the customs duties have been hiked to 200 per cent in the new Budget. There is no point opening one door and simultaneously closing the next one.

The more significant liberalisation has been in the Capital Goods list (Table 2). Another 208 items have been added to OGL bringing the total to 959. In the last four years, as many as 656 items have been put on the OGL list, an increase of 191 per cent. Quite a few of the additions this year are microprocessor-based equipment, called CNC (computerised numerically controlled) machines. The machine tools list has been doubled. Super fast spinning machines, known as open end spinning machines, have joined the OGL list along with air jet and water jet looms. The jute industry has been opened to capital goods import for the first time with 24 major machinery items on OGL. Similarly, 25 types of packaging machinery are on OGL. Other industries freshly opened to imports include oil field services and writing instruments machinery.

The impact of these changes is bound to be significant. The development of an indigenous capital goods industry was always a not very lucrative proposition for Indian businessmen, given the initial limited size of the market and the problems of technology transfer and the procedural bottlenecks created by licensing. In the face of liberal imports and the customs duty concessions, which usually follow such liberalisations, the task will become even more daunting. The case of garment machinery is an example

where OGL imports in the name of export promotion have created a situation such that with Rs 800 crore worth garment exports, the country manufactures machinery of the domestic sewing machine type only. The foreign exchange outflow from capital goods import is also significant. Table 3 shows that even after concessions in import duties every year, the customs revenue from this head has nearly doubled.

The public sector has been severely hit by the new policy. The electronics companies, especially the semi-conductors complex near Chandigarh, will find themselves out-priced by competition from abroad. A number of other corporations which survived on profits from canalisation will go into the red. Capital goods manufacturers will face more competition from imports. Imports against capital goods licensing procedures have been liberalised with the Chief Controller of Imports and Exports (CCI and E) acquiring powers to sanction applications upto Rs one crore (Rs 50 lakh earlier). DGTD approval is required now only in cases above Rs one crore. The customs duties too, specially on project imports, have undergone major reduction. SAIL, the canalising agency in the earlier policy, will face more competition since the new agency, MMTC, is interested in imports by its charter. Even the powerful DOE (Department of Electronics) has been cut to size. Its role as a super decision-making authority on every action of both government and industry has been reduced significantly.

### EXPORT-BASED IMPORTS

The second part of the import policy covers export-based imports. Import licences are given to various categories of exporters to fulfil their needs of raw material for export production. In the absence of a direct link between export production and actual exports, the licences have acquired transferability and premiums, with or without official sanction. The new import policy has extended this structure with a few modifications. The transferable REP licence which was designed to replenish the import content of exports, continues without significant change in regard to the prescribed percentage or to the shopping list. These licences have lost much of the premiums since the bulk of the shopping list covers the erstwhile automatic licensing items, 91 per cent of which are now on OGL. REP licences are now largely useful as instruments of easy imports since any bearer can use them to import the items indicated in them; OGL imports usually require the fulfilment of the 'actual user' condition. The lists for customs duty-free import against export obligation has been extended further. The procedures to acquire such licences have been standardised and decentralised.

The new Pass Book Scheme has been designed to avoid the malpractices associated with duty-free imports of raw material against export obligation. The Pass Book, it is claimed, will not leak duty exempted material into the domestic economy and is the final answer to the needs of the manufacturer-exporter for duty-free imports for export production. Its details are to be announced towards the end of the year. The Pass Book will be the seventh type of export based on import licence and may well add to the confusion in this type of licensing.

Export Houses and Trading Houses are sore at the Chief Controller of Imports and Exports (CCI and E) for giving them a raw deal. The minimum turnover for registration of small scale Export Houses has been raised from Rs 50 lakh to Rs 75 lakh. Moreover, the concept of net foreign exchange earnings has been introduced in computing growth rates for the purpose of renewal of Export House registration. The net foreign exchange earning criterion has already been in use for the additional licences available to Export Houses to meet the needs of their so-called supporting manufacturers. With the scrapping of the Automatic Permissible list, which was used for import against additional licences, there is little premium on the licences. Export Houses feel that they have been placed below Actual Users in the allocation of licensing privileges.

The hundred per cent export schemes have been linked together and movement between and among the Free Trade Zones and the 100 per cent export oriented units is now permitted. Their product range has been extended to cover gold jewellery also. A new category covering units exporting hundred per cent of production but not registered under the first two schemes has been introduced. This category will be given flexibility in using REP licences to import any item needed by them for export production.

The special facilities available to Non-Resident Indians (NRI) have been cut following the takeover bids of Swraj Paul. Now the clauses will apply only to NRI returning home for permanent settlement; NRI or persons of Indian origin wishing to just invest in India without returning home are specifically excluded.

The only significant impact of the new import policy will be in the electronics, automotive and the capital goods industries. The import bill will rise in the face of poor exchange reserves. In the absence of innovation, the policy administration will remain chaotic and directionless. Much is being made of the so-called long-term orientation and stability. The truth is that licensing policies and lists are still on an annual basis and amendments continue to average about one every four days. The only difference will be that the three-volume policy book will now be printed only once in three years. The number of schemes in various stages of disuse or abuse continues to multiply. Wordings and implementation continue to be complex with vested interests and touts playing a major role. Co-ordination between government departments is insignificant. The saying goes that the import policy is framed by DGTD, announced by CCI and E and implemented by the Customs. Information flow, specially on clarifications, is both slow and insufficient. The new policy is the old policy of the last eight years of liberalisation without clarity and orientation. What is different is that this time the country may not have its own funds to pay for all the imports generated.

## ANDHRA PRADESH

# Myth of Minimum Wages for Agricultural Labour

### M Shatrugna

ADDRESSING a May Day rally of workers in Dhanbad, Prime Minister Rajiv Gandhi announced the institution of five "worker's" awards in recognition of the service rendered by the working class to the nation. Not to be outdone in public display of love for the workers, Chief Minister N T Rama Rao also announced the institution of state awards 'Karmika Ratna', 'Shramika Ratna', etc. While awards and recognition are welcome, such public rituals should not divert the attention of the people from the deplorable state of the working class. The majority of workers are not organised, especially in the rural areas. Barring states like Kerala where the agricultural workers' movement has taken deep roots, by and large they are not organised in the rest of the country. For them the implementation of the so-called minimum wages has become the most immediate and urgent need. While the living and working conditions of workers in the urban area are bad with problems of pollution, insanitation, near absence of basic amenities like drinking water, toilets, etc, the problems faced by the rural proletariat is much worse. With runaway prices of essential commodities, inflation and non-implementation of the minimum wages Act, their very survival has become difficult.

Let us look at some statistics. According to the 1981 census, the rural population in Andhra Pradesh is 409.85 lakh and the urban population 125. 65 lakh. Out of this, the total scheduled caste population stands at 79.62 lakh and the scheduled tribe population at 31.76 lakh. Among them a majority in the rural areas and a near-majority in urban areas live below the poverty line. Most of these people have a low status both class-wise and caste-wise. According to a study conducted by R Radhakrishna, Director, Centre for Economic and Social Studies (CESS), Hyderabad, in the rural areas of Andhra, 218 lakh persons (87 lakh in coastal Andhra, 44 lakh in Rayalaseema and 86 lakh in Telengana) were living below the poverty line in 1977-78. The numbers must have gone up further since then. In terms of households, it is estimated that in rural Andhra Pradesh, 44 lakh households (18 lakh in Coastal Andhra, eight lakh in Rayalaseema and 18 lakh in Telengana) are below the poverty line. The proportion of the poor is estimated to be 49 per cent in Coastal Andhra and around 60 per cent in Rayalaseema and Telengana. According to Radhakrishna, "... the variation in poverty across rural classes is more pronounced than across the broad regions; the proportion of poor is 69 per cent for agricultural labourers; 44 per cent for cultivators; 47 per cent for 'self employed' non-agricultural class; and 34 per cent for 'employed' non-agricultural class. Out of the estimated 218 lakh rural poor, a staggering 103 lakh belong to the agricultural labour class and 67 lakh to the cultivators class; thus agricultural classes make up more than two-thirds of the poor ... In general, poverty magnitudes are higher for agricultural labourers both in developed as well as in less developed districts. On the other hand, development appears to have made a dent on the poverty levels among cultivators and the self-employed non-agricultural class." Radhakrishna further says that "Inter-district comparisons of the incidence of poverty reveals that development in general reduces the incidence of poverty among cultivators and self-employed class and it does not make much dent on the poverty levels of agricultural labourers who constitute the hard core of the poor".

One of the chief reasons for this state of affairs is that the people do not have enough purchasing power with which to buy their daily needs. This means they do not have regular income-generating sources to look after themselves. The rural poor with no property whatsoever have to depend on their labour power only to sustain themselves. What are their employment opportunities? Barring agricultural operations they do not have any major sources of employment. Also agricultural operations can give them only seasonal employment. Generally it is accepted that an agricultural labourer does not have work for more than 130 days in a year. The rest of the time he is either underemployed or is attending to such jobs as do not given him two square meals a day. The growing indebtedness of the rural poor is an index of his economic condition.

Many studies show that even during periods of work the agricultural worker does not get paid minimum wages. Though men and women are supposed to get equal wages for the same type of work, women get paid less than men. The so-called minimum wages as prescribed at present are outdated and do not have much relevance to the present price structure. Minimum wage rates can be calculated on the basis of energy consumption in the form of food. One of the scientific methods of determining the basic needs of a person is on the basis of what is called the balanced diet calorie intake. The National Institute of Nutrition, Hyderabad, an affiliate of the Indian Council of Medical Research under the Government of India, has done pioneering work in calculating and computing the calorie intakes for different sections of the community. In fact, it is the only recognised Institute in the country in that area of work. Hence we can take NIN calculations as official. According to the NIN data, the computed cost of least cost balanced diet suggested by ICMR providing 2,700 K calories (at prevailing prices) works out to be Rs 4.07 per day for a 'moderate worker' (see Table 1).

An average Indian family consisting of an adult male, adult female, one pre-school child, one school-going child and an aged dependant needs a total calorie intake of 9,930/K cal/day to keep above the poverty line, according to ICMR standards. The cost of this calorie intake including fuel, etc, works out to be Rs 24.45 per day at current prices. Now this diet recommendation is for moderate workers, like Class IV employees in the urban areas. Therefore in order to meet the ICMR recommended diet, an urban 'moderate worker' should have a minimum wage of at least Rs 24.45 per day. But what is the present rate? It is around Rs 10 per day.

TABLE 2: RECOMMENDED FAMILY CALORIE INTAKE FOR AGRICULTURAL WORKERS

| | Energy Allowances (K cal/day) | |
|---|---|---|
| | Moderate Worker | Agricultural Worker |
| Adult male | 2,700 | 3,350 |
| Adult female | 2,200 | 2,800 |
| Pre-school child | 1,200 | 1,200 |
| School-age child | 2,050 | 2,050 |
| Aged dependant | 1,760 | 1,760 |
| | 9,930 | 11,160 |

TABLE 1: SUGGESTED BALANCED DIET FOR ADULT MALES (MODERATE WORKER)

| Food Stuffs | Cost/Kg (Rs) | Recommended Balanced Diet (gms) | Cost (Rs) |
|---|---|---|---|
| Cereals | 3.00 | 520 | 1.50 |
| Pulses | 8.00 | 50 | 0.40 |
| Leafy vegetables | 3.50 | 40 | 0.14 |
| Other vegetables | 3.50 | 70 | 0.25 |
| Roots and Tubers | 2.00 | 60 | 0.12 |
| Milk | 4.00 | 200 | 0.80 |
| Fats and oils | 16.00 | 45 | 0.72 |
| Sugar and jaggery | 4.00 | 35 | 0.14 |
| Total cost of diet | | | 4.07 |

For the agricultural worker, the recommended 'family' calorie intake is 11,160 K calories per day (see Table 2). The cost of food, etc, for this energy requirement is Rs 27.47 per day. Therefore the annual income for this category of households should be Rs 10,026.55. But according to the government, unlike in an urban area, husband and wife are supposed to be employed in the rural area. But this generally is not the case. Increasingly there are more woman-headed families. Even according to the government formula, a man and woman should earn Rs 5,013.27 each per annum to fulfil the ICMR criterion. Further, an agricultural worker should either earn this amount in the 130 days he is gainfully employed or earn the same amount in a job that gives him employment throughout the year. In the 130 days work norm, the daily minimum wage would have to be Rs 38.56 at current prices. At present he does not get even one-fourth of the above amount.

When the problem is so serious and gigantic it is surprising that the opposition political parties in the state who swear by the working class do not think it important to agitate for the implementation of the present minimum wages Act, let alone fight for upward revision of the minimum wages based on the NIN calculations. It is also interesting that when certain political groups run by the Ryothu Cooli Sanghams organise the rural poor on such basic issues, their activities are met with the armed might of the state apparatus, though the present government in the state came to power twice within 28 months in the name of the poor.

### WORLD ENVIRONMENT DAY

## Facade and Reality of Environment Protection

**Bharat Dogra**

DEVELOPMENT may be defined as the use of natural resources for the satisfaction of human needs. This is a general, value-free definition of development, and there can be several kinds of development. Environmental consciousness in development planning may be described as the exercise of caution in development planning to ensure, firstly, that the natural resources, including air, are protected for safe and adequate use by future generations and, secondly, that development projects do not jeopardise the lives of people working on them or living near them.

Clearly, the need for such environmental consciousness exists under all socio-economic systems. The need, however, is the greatest in highly inegalitarian and oppressive systems (such as the one that exists in India today) because under such systems a relatively small number of individuals (or commercial organisations) acquire highly concentrated power to use natural resources to maximise their profits, irrespective of the havoc this pursuit may cause to a large number of people in this and the next generation. Such ruthless plunder of natural resources, apart from the destruction and pauperisation it causes immediately, will leave the country so exhausted of the base of prosperity that the welfare tasks of a people's government that may emerge at a future date would become extremely hard to achieve.

Thus it is clear that environmental consciousness in development planning is extremely important in India today. Unfortunately, despite all the talk about environment that one hears, it cannot be said that such consciousness exists in influential circles of the government, the experts, the press, etc. What exists is merely the pretence of such consciousness, often surfacing in totally distorted views on environmental protection.

To give an example, let us take up the plea for scientific land-use planning wherein it is said, not only for India but for several Third World countries, that over-cultivation should be avoided and marginalised farm land should be brought under afforestation schemes. Nothing wrong in this, or course, except that when such statements are made in isolation from the existing realities of inequalities in land-ownership, they tend to acquire a sinister meaning. In a village where the bulk of good cultivable land is occupied by a relatively small number (say, 10 to 20 per cent) of the families, the poor families may be able to have access, if at all, only to the marginalised land to grow a little grain. Under such conditions programmes for scientific land-use planning, before they can start doing any good, will first of all rob the poorest of what little land they have. It is well known that generally it is the marginalised land that has been distributed among the poor under the land redistribution programme in India.

Some other observers of the environment scene, however, are more careful. While asking for better land-use planning, they also look at the inequalities and ask for implementation of land reform laws. Even they, however, do not bother to ask how limited the scope of land-reforms all along has been and how blatantly even this limited scope has been thwarted with the collusion of the elected legislatures and the administration. Therefore, these observers can merely make a pious, convenient-to-themselves plea to implement land reforms. Even this much of consciousness is confined to only a small number of the environment enthusiasts. I cannot forget how at a prestigious seminar on environmental issues the senior-most member had objected to my bringing in the question of land-reforms in a discussion on environment and insisted that the relationship, if any, between the two issues should be proved.

Is it mere lack of perception which comes in the way of a more meaningful discussion of environmental issues? Questions based on the total failure of land redistribution in the post-independence period will raise questions of the class-character of the government, and of finding alternative paths if the scope of egalitarian distribution of land in the present system is so limited. This is where the easy money, the lucrative projects, the convenient jobs of the environment establishment start drying up, and this probably explains why the discussion is generally only skin-deep.

All over the country the members of the ruling classes—the industrialists, the big landowners, the mining lease-holders and forest contractors, the tractor-owners, etc—have been using up natural resources in the most ruthless way with total disregard for the people living around or for the conservation of resources for future generations, and generally nothing is done to punish them for this crime. However, in isolated places here and there some action to prevent this ruin is taken. This is sometimes the result of elitist notions of some influential people (for instance, the affection which the Prime Minister's family is known to have for Dehradun and Mussoorie), sometimes it is the result of the efforts of some people in search of fame and awards, etc, and yes sometimes it is also the result of the tireless efforts of some genuinely concerned and courageous people, specially the affected villagers. At some places some official or law court gives orders to stop some ecologically destructive activities and this gets headlines in the press. It is a moot point whether ecologically destructive practices stop even in such places, or whether they continue illegally, sometimes even more indiscriminately.

It also needs to be considered that if the entire structure of property relations and the prevailing systems of corruption, repression of people's struggles, etc, is such as to result in ecological ruin, how can the framing of technologically impressive prestige projects, such as the ones for saving the Ganga or the Himalayas, succeed?

Who exactly are the people and agencies pouring in money to spread such distorted and shallow views on the protection of environment? What are their motives? Discussion on such issues will not be irrelevant for those genuinely committed to promoting ecological consciousness in development planning. The latter know only too well that the environmental movement can only be a part of the wider struggle for fighting inequalities and injustice so that natural resources are used in an egalitarian way for the benefit of all in this and future generations.

# Failure of Western Economic Summit

**Siri**

MUCH hope was pinned on this year's economic summit of the seven most powerful industrial countries—the US, Japan, West Germany, Britain, France, Canada and Italy—in Bonn on May 2-4. It was hoped that they would reach a firm agreement to initiate a new round of multilateral trade negotiations under the auspices of GATT; that they would address themselves to the question of persistent misalignment in exchange rates; and, above all, they would see the need for a co-ordinated reflation, to revive the flagging growth of their economies. Yet the Summit concluded with a bland economic statement, giving little encouragement to all those who hoped for a major policy initiative.

### BACKGROUND TO PRESENT CRISIS

To understand the full magnitude of failure of the Bonn Summit, one should go back to the first oil price rise in 1973 and the course of events since then. Before the first oil price rise, the industrial countries had an export surplus, the oil exporting countries were roughly in balance, and the non-oil developing countries had enjoyed a deficit. The industrial countries were functioning at near full employment levels, and the developing countries were able to generate growth rates of above six per cent per year.

The first oil price rise, however, resulted in considerable surpluses for OPEC countries; the industrial countries were not too keen to bear the counterpart deficits, one reason being that it would have resulted in considerable weakness and uncertainties in regard to key currencies. In the end, the banks played a significant intermediating role by on-lending OPEC deposits to some developing countries—mostly middle income countries—which are either blessed with rich natural resources including oil (e g, Mexico, Brazil, Venezuela, Argentina, Nigeria, Indonesia) or are building up a good base in exports (e g, South Korea). The counterpart deficits to OPEC surpluses thus came to be borne by the developing countries. The industrial countries did deflate their economies, but the deflation in the world economy as a whole would have been more significant if the developing countries had not run the considerable trade deficits.

The events following the second oil price rise in 1979, however, had been far more dramatic. The industrial countries, which were horrified by the prospect of a renewed inflation, responded by adopting very restrictive fiscal and monetary policies. 'Driving out inflation from the system' became the chief policy objective. Interest rates soared; output and world trade suffered. The developing countries which had borrowed heavily in the past on the basis of a continuation in the growth of their exports were suddenly in a squeeze: on the one hand, their export earnings collapsed; and, on the other, their debt service payments increased as interest rates went up. These signs of trouble led to a cessation of commercial flows, so that the opportunities for a roll over of debt—a practice on which they had come to rely in the preceding few years—diminished. Many of the indebted developing countries had to undertake to generate large trade surpluses as part of debt reschedulings, a task which they perforce embarked on by deflating their economies severely. The debt crisis further added to the deflationary bias in the world economy. The OPEC countries had by this time began to see their surpluses diminish to near zero levels.

### RECENT REVIVAL OF GROWTH

The spiralling US budget deficit—arising out of tax cuts on the one hand and increased defence expenditure on the other—has, however, begun to have an expansionary effect on the US economy from mid-1983 onwards. The US economy began to grow at an exceptional rate; in 1984, its GDP grew by nearly seven per cent. The large fiscal deficits in conjunction with a very tight monetary policy—adopted as part of the 'anti-inflation' strategy—kept interest rates high, and drove up the value of the dollar. The trade deficits of the US began to rise rapidly, reaching some $ 125 bn by 1984. Part of the counterpart surpluses to the US deficit was found in the developing country surpluses, who were perforce earning them. But a significant part was also reflected in the surpluses of Japan and West Germany, which together enjoyed a surplus of over $ 50 bn in 1984. In effect, industrial countries began to enjoy an inflow of savings from developing countries; and among industrial countries, the US became a substantial importer of savings, and Japan and West Germany became substantial exporters of savings.

The situation could have continued along these lines, if the US could have continued to grow at the same rate, sustaining a large trade deficit. By the beginning of 1985, however, it was clear that the very factors which had brought about the exceptional growth in the US in the past two years are likely to bring about a slow down in its growth: (i) the large budget deficits, coupled with high interest rates, meant that the proportion of interest payments in US budget expenditure has gone up considerably, and the expansionary stimulus of the budget deficit has declined; (ii) the trade deficits, which are partly due to the increased strength of the dollar, have become deflationary; (iii) the high rates of interest have also pushed up consumer debt. Further, investment in housing and such durable investments which tend to be sensitive to interest rates began to slow down. As a result of all these factors, a significant slow down in the US growth was projected. In the first quarter of 1985, quick estimates suggest that the US growth may have decelarated to 1.3 per cent (annual rate). Even if the economy were to pick up growth in the rest of the year, most forecasters do not expect a growth rate exceeding 3½ per cent.

### PROBLEMS BEFORE BONN SUMMIT

By the time of the May Bonn Summit, it was clear that:

(i) the US economy has become a net importer of savings, and under most projections it would remain a net importer of savings for some time to come;

(ii) for the US to continue to attract savings on the scale required, it cannot allow too precipitate a fall in the value of the dollar; on the other hand, the large trade deficit, which is partly due to the appreciation in the value of the dollar, is pulling down its own growth.

(iii) Japan has emerged as a country with a structural excess of savings over its own investment—a feature which is reflected in its large trade surpluses;

(iv) the indebted developing countries have become, perforce, generators of large trade surpluses; the OPEC countries, on the other, have moved to near zero trade balances; and

(v) the contractionary fiscal stance outside the US meant that there is no obvious way by which the slack in world economic growth arising from the slow down in US growth will be taken up by growth elsewhere.

### DISAPPOINTING OUTCOME

Faced with these problems, the Bonn Summit came out with little which suggests that industrial country growth will be revived. This is especially galling because unemployment rose to above 31 million persons in all OECD countries together, and in some it has reached an intensity comparable to that of the 1930s. Trade conflicts have also taken an ugly turn, with major industrial countries accusing each other of unfair practices and threatening to take unilateral action. Indeed, the economic communique, for the first time, devotes a paragraph for each one of the participating countries' intentions—but in sum it adds up to little by way of a major policy initiative.

(i) The emphasis is still on controlling budget deficits and fighting inflation. It was hoped, before the Summit, that the US would put pressure on the Europeans and Japan to reflate. US Secretary of State Schultz said as much in a major speech at Princeton University on April 11. The two countries which are in a strong position to reflate are Japan and West Germany; they both enjoy sizeable trade surpluses, and low inflation rates; unemployment in West Germany has been rising and is currently above nine per cent of labour force. Yet the communique says that West Germany will "continue to reduce the claims of the public sector on the economy, the budget deficit and the burden of taxation"; and that Japan "considers it essential to persevere with its policy of budgetary discipline . . .". In other words, no major step towards reflation.

The explanation offered was that when it was last decided to reflate at the Bonn Summit in 1978, it led to a resurgence of inflation; therefore, all industrial countries are shying away from a similar course of action. But surely, the present weakness in the oil market, and in commodity prices in general, shows that the situation is qualitatively different from that in 1978. It is also rather surprising that West Germany and Japan do not wish to reflate on their own; the government in West Germany must be getting worried at the high and rising level of unemployment; and Japan must be getting worried at the rising trade surpluses, which are likely to invite retaliatory action.

The explanation in the case of Japan, that it has already got a comparatively large public debt, and therefore cannot afford to allow its budget deficit to rise, poses a problem to the international economy in view of the substantial excess of private savings over private investment there. If Japan does not absorb the excess of private savings in a corresponding budget deficit, then the only alternatives are: (i) the excess savings have to be exported abroad, which implies that it will continue to have a trade surplus, and others should be prepared to bear the counterpart deficits; or (ii) it should give away a part of its savings as foreign aid. Indeed, suggestions have been made that Japan should adopt policies that encourage private consumption and reduce private savings, by reducing the tax incentives for saving; and that it should provide much larger foreign aid—suggestions which are very Keynesian indeed!

But the reluctance of West Germany and Japan to reflate still calls for an explanation. Some cynics have gone as far as to suggest that: (a) neither of the countries wishes to give a stronger foothold to imports *via* reflation, for, once imports start flowing in, it will be difficult to reverse the flow later on; and, (b) Japan is not keen to encourage a high consumption society, as it sees its high savings propensity as providing a competitive advantage. It does not wish to turn itself into another America, where savings propensity is low. In other words, the major powers are playing a complicated game, where they are unwilling to accommodate each other in the interests of global growth.

(ii) The unwillingness to undertake a coordinated reflation also leaves the problem of developing country surpluses unresolved. So far, the major developing country debtors have succeeded in generating trade surpluses largely because of the stimulus provided by US growth. The Latin American countries, for example, managed to generate some $ 30 billion trade surplus in 1984. If the surplus countries are not willing to reflate, and if US growth slows down and US consciously adopts policies towards reducing its trade deficit (e g, by allowing the dollar to depreciate, or by imposing a surchage on imports), then the question of counterpart deficits to developing country surpluses arises. The projected level of official and private investment flows to developing countries will be insufficient to meet the finance needed to meet debt service payments; bank lending, which is reduced to a trickle, is not projected to rise to any significant level. The developing country debtors, therefore, would be required to earn trade surpluses, but it is not clear who would bear the counterpart deficits.

(iii) The high dollar rates of interest are recognised as a major problem and the industrial countries have been urging on the US to cut its budget deficit as a way of bringing down the interest rates. Many Europeans believe that they were locked into keeping their own interest rates high, to protect the value of their currencies—even though West Germany and Japan have both maintained comparatively low rates of interest by maintaining an accommodating monetary policy in conjunction with a contractionary fiscal policy. There is no doubt that the large budget deficits in the US *in combination with a tight monetary policy* have resulted in an upward pressure on interest rates and the value of the dollar. The deregulation in financial markets, which had the effect of increased competition in capturing private savings had been a major factor as well. The need to raise finance by the developing country debtors—either *via* roll over loans or *via* rescheduling of debt—must also have introduced a tightness in credit markets. The fact that the banks can demand substantial margins over the LIBOR, for example, indicates an element of inelasticity in the market—the developing country borrowers have no choice but accede to pay whatever interest is demanded of them in a manner reminiscent of the poor peasant in India paying high rates of interest on his consumption loans!

All these factors have worked towards keeping interest rates high. For the interest rates to decline, therefore, we need an improvement in the US budget deficits, along with a more accommodating monetary policy in the US and an improvement in the debt situation. The chances of an accommodating monetary policy in the US are remote; the Bonn Summit has made it clear that the policies adopted since the second oil price rise in the fight against inflation must be continued. But the industrial countries are keen on seeing a reduction in US budget deficits, and the communique states that "the President of the United States considers it essential to achieve a rapid and appreciable cut in public expenditure and thus a substantial reduction in the budget deficit".

It is not clear, however, that the US will succeed in achieving substantial reductions in budget deficits. As Peter G Peterson, a former Secretary of Commerce in the US Administration, has argued in the 1984 per Jacobsson Lecture, the prospects for a reduction in US budget deficit remain bleak; even under some fairly optimistic assumptions regarding US growth (3 to 3½ per cent for the rest of the decade) and interest rates (short term interest rates fall to 9 per cent), the annual US budget deficit could rise from $ 185 billion in 1985 to over $ 230 billion by 1989. For the US, it might also prove difficult to grow out of the budget deficit. To reach a deficit of $ 30 billion by 1989, the US would need to combine real growth rates of just under 6 per cent for seven consecutive years, unemployment would have to fall to 2 per cent, inflation to 3.5 per cent and interest rates to 5 per cent. Clearly, an impossible scenario!

The chances are, therefore, that under most plausible scenarios, the US budget deficit will remain substantial and it will remain a net importer of savings. The chances of achieving a reduction in interest rates remains rather remote; this will continue to raise the financing needs of debtors, in turn reinforcing the upward pressure on interest rates.

(iv) The US sees a further round of trade liberalisation as the great way out of its dilemma. It is much irked by its imbalance in trade with Japan, and by the insularity of Europe in regard to agriculture. The call for a new round of multilateral trade negotiations under the auspices of GATT has received support—tacitly or otherwise—from all the participants except President Mitterand who has refused to clinch things by agreeing to a date for initiating the new round. The communique says: "we strongly endorse the agreement reached by the OECD Ministerial Council that a new GATT round should begin as soon as possible. Most of us think that this should be in 1986". Mitterand has reportedly not agreed to a date for the new round because he thought that the right forum to decide that is the GATT itself, where developing countries can also have a say. But the real reason seems to be his unwillingness to open up the European Community's Common Agricultural Policy for negotiation.

If the industrial countries fail to make progress in including agriculture for negotiations and if they continue to impose restrictions in products of interest to developing countries, such as textiles, leather, footwear, steel, etc, then, the scope for liberalisation of trade will be vastly restricted. Industrial countries seem to be united in trying to get services included in the agenda, in the belief that they have a vast market in developing countries in that area. The developing countries have been resisting a call for a new round, which seems to be concerned mainly with the interests of industrial countries—and in the absence of a commitment by them to re-examine the restrictive practices against them embodied in such agreements as the Multi Fibre Arrangement.

(v) The Bonn Summit has also shelved the question of discussions on monetary reform. For long, it has been clear that with the advent of floating rates, it is not only the day to day fluctuations in exchange rates that have become a problem, but also the tendency towards a persistent misalignment in exchange rates. At the heart of it all lay the problem of whether the major industrial countries are willing to subject themselves to a multilateral surveillance of their policies. The IMF is entrusted with this role, but it has little power against the major countries.

Developing countries have long emphasised the importance of multilateral surveillance, and the need to institute mechanisms for an orderly growth of world liquidity. The IMF, however, barely does more than 'police' adjustment in developing countries at present, following the debt crisis. Attempts to enhance its surveillance role in industrial countries have repeatedly met with failure. Recently, the US has given the impression that it is prepared to listen, but the Bonn Summit has shelved these questions by noting: "It is also essential to improve the functioning of the international monetary system. We take note that the Finance Ministers of the Group of Ten (industrial countries), at their meeting in June (1985), intend to complete their current work on ways to improve the functioning of the monetary system and to put forward proposals, to be discussed at the next meeting of the Interim Committee of the International Monetary Fund in Seoul in October, with a view to making the international monetary system more stable and more effective." In other words, 'wait, we do not yet have any positive ideas on the matter, it is still under study'!

### DEVELOPING COUNTRY PROBLEMS

The Bonn Summit does recognise that "sustained growth in world trade, lower interest rates, open markets and continued financing in amounts and on terms appropriate to each individual case are essential to enable developing countries to achieve sound growth and overcome their economic and financial difficulties", but it does little by way of suggesting some concrete steps to alleviate the problems of developing countries. It does call for increased ODA, and recommends longer term rescheduling of commercial as well as official debt; but all the indications are that ODA has been stagnant, and major industrial countries are increasingly adopting a bilateral approach in pursuit of their economic and strategic interests; they have also proved to be remarkably unforthcoming in rescheduling official debt—which particularly falls on low income countries—on a multi-year basis. The only practical suggestion the Bonn Summit has come up with is that the participants "emphasise the need to examine the establishment of a research network on dry zone grains".

It is not far wrong to say that in the present crisis, the industrial countries see an opportunity to increase their leverage in the formulation of policy in developing countries, and in pursuit of building an economic and political environment conducive to their interests. The industrial countries have done little to promote increased financial flows—but at the same time the power of the institutions such as the IMF and World Bank, in imposing conditionality on developing countries, has enormously increased.

### CONCLUDING REMARKS

It is often said that it is not 'logic' or 'good sense' which provides the impetus for major reforms but the perception by a major power that its vital interests are at stake. The realisation in the US that its growth is sharply slowing down and that the ballooning trade deficit is costing jobs has made the US certainly more responsive to the need for international economic action. It has become a firm advocate of trade negotiations, and it is very likely that, following the Bonn Summit, preparations for negotiations will take a firm shape. But it is disappointing that very little further progress has been made. The announcement by Baker, the new US Secretary of the Treasury, at the OECD Ministerial Meeting in April, that the US would be willing to host a monetary conference does indicate that it is becoming more open to discussions on international monetary reform; there are also some indications that the US is prepared to see an increased role for the IMF in its surveillance function. But they remain distant ideas, and the Bonn Summit has given no indication that it has advanced matters further. The idea of a coordinated reflation, voiced in Schultz's speech, was also put aside. Meanwhile the developing countries remain powerless to influence the course of events.

What is very disturbing is the impression that the industrial country leaders have not appreciated the need for a major adjustment in their own policies, if we have to get around the problems posed by the structural trade surpluses of some industrial countries and indebted developing countries, high interest rates resulting from the imbalance between fiscal and monetary policies in the United States, and increasing tendency towards protectionism. In the absence of a resolution to these problems, industrial country growth is likely to falter, trade conflicts are likely to intensify, default by developing country debtors becomes more probable and low income countries are likely to suffer further intolerable cuts in their living standards. Perhaps, economic and political conditions need to worsen further, before the industrial countries wake up to the need for reform.

# Biology and Gender Bias

## Some Issues in Discrimination against Women at the Workplace

**Vimal Balasubrahmanyan**

OVER 30 years ago, the Constitution of India had proclaimed certain far-reaching concepts to ensure equality of the sexes. This was long before the various ILO and UN conventions to promote equality and prevent sex discrimination were adopted by the nations of the world. And yet, the continued deeply-entrenched existence of sex-discrimination at the Indian workplace reflects what Justice Krishna Iyer described as "the distance between Constitution in the Book and Law in Action".

What does the Constitution guarantee? Article 14 ensures equality before the law. Article 15 prohibits discrimination on basis of sex. Article 16 guarantees equality of opportunity in matters relating to employment. Article 39 guarantees equal pay for equal work. Article 42 says it is the duty of the state to provide for maternity relief.

All this gives an impression that equality and protection from sex discrimination have been handed on a plate to Indian women without their even demanding it—leave alone fighting for it. What, on the other hand, is the reality?

I shall first cite three recent court cases which reveal the tip of the iceberg of gender bias. Next I shall give some examples of sex discrimination which have *not* been taken to court and which provoke the question: why do women continue to enduse such bias in employment? And finally, I shall give some facts which show that prevalent patriarchal attitudes are so deep-rooted and so totally at variance with the radical constitutional norms that something substantially more than legal battles is called for to achieve fundamental change in the work environment.

First, the three court cases. In 1979, C B Muthamma, India's first woman IFS officer, filed a writ petition in the Supreme Court on the ground that two IFS service rules violated Articles 14 and 16. One rule required female employees to take permission before marrying. It also gave the government the right to ask any married woman officer to resign if it was felt that her family responsibilities would interfere with her efficiency. The second rule totally denied employment to married women. As soon as the petition was filed, the government itself repealed the two obnoxious rules and Justice Krishna Iyer, before whom the case came up, said he was "dismissing the petition but not the problem". He directed that Muthamma's seniority should be reviewed because in the meantime some of her juniors had been promoted over her. And he urged the Union government to overhaul all service rules and delete all discriminatory clauses without waiting for "ad hoc inspiration from writ petitions".

The second case is the much publicised petition of the air-hostesses of Air India and Indian Airlines in 1981. They were fighting against discriminatory service conditions and demanding parity with male cabin crew. They won some gains but lost on several crucial issues—which means that this legal battle is not yet over. The air-hostesses won the right to continue in service beyond age 35 upto age 45. The rule which made them resign on first pregnancy was struck down as unconstitutional. However, their demand to retire at 58 like male cabin crew was rejected and the rule which required them to remain single for the first four years of service was also upheld. Many progressives had at the time expressed surprise that these biased rules were retained—but of that more later.

The third case was in 1983 when the Kerala High Court held that denial of jobs to women in class IV government service was discriminatory and unconstitutional. The court directed the state government to consider the two women petitioners for the next two immediate vacancies and also alerted both state and Union governments to initiate affirmative action against sex discrimination.

These are three important precedent-setting court rulings and one would have imagined that following these initiatives the Supreme Court and the High Courts would have been simply flooded with petitions from other women employees similarly victimised by gender bias. That this has *not* happened suggests two things: one, most women workers are unaware of the constitutional provisions and unaware that they can take such issues to court. Two, even if they have become aware, it has not been easy for them to get involved in lengthy legal battles. Nor do such issues find priority with male-dominated trade unions.

Even in the advanced EEC countries which have stronger legislation and more streamlined procedures to deal with complaints on gender bias, such discrimination on the basis of sex is far from being wiped out. A recent ILO report on this topic offers two reasons: one, few women use the law to fight back, and, two, rising unemployment and fear of dismissal prevents many of them from pursuing such complaints.

I shall give three recent examples where service and recruitment rules are patently discriminatory and yet these have not been challenged in court, to the best of my knowledge.

Last year, there was much media coverage on married women house surgeons of Lady Hardinge Medical College who were required to take pregnancy tests at the time of appointment. They were offered jobs only if they were *not* pregnant. After six months they had to repeat the test, and if pregnant, were told *to abort or quit*. These women had protested against this rule to the hospital authorities, the Health Minister and even the Prime Minister. But they have so far not petitioned the court.

The second example is a news item from the *Hindustan Times* in 1981 which reported that a Home Science College in Coimbatore has a standing order for married women lecturers—"Have your baby in the vacation". One lecturer had to undergo an abortion because the delivery date would not coincide with the vacation and the college would not give her maternity leave. This rule too has so far not been challenged in court.

The third example is even more devious. It is an advertisement issued by the Directorate of Advertising and Visual Publicity (DAVP) of the Government of India for a midwifery course in Delhi's Safdarjung Hospital. The notice specifically excludes married women, and women with children, by offering the course only to 'unmarried women' or 'widows without encumbrances'. This too remains an unchallenged criterion.

I have specifically chosen examples which show how women employees and job applicants are literally penalised for their biological function of child bearing and the social role of motherhood. The assumption being that children, to quote the DAVP advertisement, are an 'encumbrance', interfering with the efficiency of women. The rules are also specifically aimed at avoiding payment of maternity benefits as required by the law. Two of the examples are of government departments which, more than anyone else, ought to be setting the standards for upholding constitutional norms. (I am not dealing here with violations of the Maternity Benefits Act and the ploys used by employers to prevent women from qualifying for benefits under the Act. Also, there is no scope in a short paper like this to discuss the many other equally pernicious areas of gender bias which cover access to professional training, concentration of women in certain low paid jobs, discrimination through sex-segregation of jobs, loopholes in the Equal Remuneration Act, how protective legislation is used to deny jobs to women, etc.)

Coming back to the framework of this paper, the third issue which I wish to raise is that prevailing sexist attitudes are so deeply entrenched that legal remedies alone will obviously not be enough.

In the very first chapter of its 1975 report, the Committee on the Status of Women in India had recalled how in 1970, when Charan Singh was UP Chief Minister, the state government had written to the Centre that women should *not* be appointed to the IAS and that if this was not possible, at least women officials should not be sent to Uttar Pradesh. In the Army Medical Service, until 1972, women had to quit on marriage. At the time the committee was preparing its report, neither doctors nor nurses were entitled to paid maternity leave. The committee also noted that despite the constitutional directives, there were instances in Tamil Nadu and Madhya Pradesh where the state government itself had fixed unequal wage rates for male and female agricultural sowers. When such are the attitudes in government circles sexist norms in the private sector need hardly be elaborated upon.

Further, it appears that according to the current judicial interpretation, the constitutional norms are *not* binding on the private sector. In his 1982 lectures on "Gender Justice", Justice Krishna Iyer had drawn pointed attention to what he called the 'conservative' attitude of the courts in this regard which have ruled that the private sector can "lawfully discriminate against women". The Supreme Court, he said, had been liberal in interpreting the word 'state' to cover public sector undertakings and it was time that private units were compelled to abide by Articles 14 and 16.

In the Kerala case, which I mentioned earlier, Justice Potti had flayed the state government for denying class IV jobs to women and he had said that it was *not* for a male-dominated legislature or a male-dominated bureaucratic machinery to decide whether women may be allowed to do certain jobs or not. The Muthamma and the Kerala rulings are a welcome sign of a change in judicial attitudes—certainly a sign that there are some judges at least who reject old-fashioned views on women and employment.

These rulings certainly come a long way from the occasion in the early 70s when the Supreme Court upheld a rule excluding women lawyers from applying for a short service commission in the army judicial service. In another case, quoted by Vimal Ranadive of CITU, girls working in several drug multinationals had challenged the rule which terminated their services as soon as they married. As far as I am aware, this was under the Industrial Disputes Act, and the Bombay High Court had *upheld* the rule. The Supreme Court, however, struck down the rule "in the interests of social justice". But it did *not* order reinstatement of those already sacked under the rule.

Incidentally, Article 11 of the UN Convention for Eliminating All Discrimination against Women specifically prohibits dismissal on grounds of marital status, pregnancy or maternity. It came into force in 1981, and as of March 1983, 47 nations had ratified the convention. India is *not* one of these.

One of the most serious and disturbing features of this whole issue is the reactionary attitude of the government itself. When the air-hostesses' case was filed, two women MPs, Margaret Alva and Ambika Soni, had initiated a debate in the Rajya Sabha and demanded that all discriminatory service conditions be removed. The then Civil Aviation minister, far from using this as an opportunity to promise a review of the offending rules and ensure justice, went out of his way to defend the existing conditions and deny that they were discriminatory. He had gone to the extent of making a statement that air-hostesses could very well have their babies after retiring at 35, and saying that it was a question whether an air hostess would attend to her professional duty or her child. It is shocking that a minister can give such replies with impunity in this time and age. This was in 1981, six years after the International Women's Year was celebrated with much fanfare and 34 years after the Constitution had been formally adopted.

Even the highest court's judgment in this case had evoked considerable surprise. A Supreme Court advocate writing in *India Today* had earlier suggested that the air-hostesses' case was so strong that it was a foregone conclusion that the Court would take this opportunity to "teach the Maharajah some modernity". Commenting later, the journal regretted that the Court let slip an opportunity to articulate what it described as a 'unisex' view of the Constitution. It was all the more disappointing because the Court had in recent times pronounced so many progressive landmark judgments in favour of deprived sections. Even Indira Gandhi had at that time expressed a sexist and traditional view by declaring that 45 "is too old" for an air-hostess, thereby equating their work qualification with youthful beauty—a criterion which the Supreme Court itself had rejected in strong language, while passing severe strictures on the airlines management for defending such sexist norms.

In both the Muthamma and air-hostesses' cases much amazement had been expressed by commentators that it had taken *three decades* for women employees to challenge their blatantly biased service conditions. In fact one of the arguments of the airlines management was that a rule left unquestioned for so long automatically acquired immunity from legal challenge!

Again, when the Lady Hardinge doctors' case figured prominently in the press, the Health Minister, in answer to a question in Parliament, had tabled the following reply: "Pregnancy is not a bar for Lady Hardinge doctors except in the case of first year married junior residents". Thus instead of trying to set right an injustice brought to his notice, the minister offered a highly unsatisfactory reply which neither explains nor justifies the discrimination against the junior women doctors.

It may be added here, that according to an ILO compilation of maternity legislation, although many countries have made dismissal during maternity leave illegal, very few have abolished dismissal during *pregnancy*. The Lady Hardinge rule is a clear instance of the authorities wriggling out of payment of maternity benefits by the simple strategy of refusing to employ junior doctors who are pregnant.

To this I may add a little tailpiece from the *International Socialist Review* (March 1974). At one point of time in the US, employers were going so far as to require female job applicants to take pregnancy tests before being hired. A laboratory engaged in doing pregnancy slide tests ran a series of advertisements in major papers and journals with copy that went like this: "Before the company hires her, make sure she is not pregnant. Make pregnancy testing a routine part of your pre-employment physical. And find the pregnant before your company gets involved in costly training programmes as well as health and sick pay coverage."

QED about sums it up. The only saving grace is that the Health Minister did not quote this item and defend the Lady Hardinge rule as a "sophisticated management technique", for "cost-efficient hospital administration"! Though that, of course, is what it really is. Most discriminatory practices against women employees boil down to a method of saving money for the employers.

To conclude, women must first become fully aware of their legal, constitutional and human rights at the work place. They must work to get these incorporated into, and protected by their service conditions. And they must demand an appropriate machinery for redressal when these rights are violated. And side by side with all these safeguards, equally important—though probably far more difficult—is the intensive education of people, both men and women, at all levels of policy planning and decision-making, to remove old-fashioned, sexist notions of women and their work.

[Paper read at a seminar on "Women and Employment" on March 31, organised by Mahila Abhyudaya Samastha and ICSSR in Hyderabad.]

# Promoting Equitable and Balanced Development

## Potential of Secondary Cities

**Meera Bapat**

**Secondary Cities in Developing Countries: Policies for Diffusing Urbanisation** by Dennis A Rondinelli; Sage Library of Social Research, Vol 145, Sage Publications, Baverli Hills, 1983; pp 288, $ 28.00.

THIS book is a reorganised version of a study commissioned by the United States Agency for International Development to review the literature on urbanisation in developing countries and on the potential of middle sized cities to contribute to national development. It draws on a number of sources of data which include government documents, policy statements of international aid agencies, primary and secondary data and case histories of cities from a diverse range of Third World countries from China to South Korea, Thailand to Tanzania and Brazil to Cuba.

The author notes that after the 'urban bias' in favour of investment in large metropolitan areas of foreign aid and national development policies in the 1950s and 1960s, the 1970s have been increasing poverty in rural areas and growing disparities in living conditions and levels of development between urban and rural areas of the Third World countries. "The increasingly severe social, economic, physical and political problems associated with rapid growth of the metropolitan areas, together with the worsening poverty in rural areas, impel planners and policy-makers to search for new approaches to spatial development."

### 'BACK-WASH' EFFECT

Attention is now being focused on the relationship between urban and rural development. Policy analysts in international agencies now argue that a more balanced pattern of urbanisation may play the potentially positive role in promoting equitable development. An underlying assumption of the new approach is that "a system of functionally efficient intermediate cities linked to larger and smaller urban centres and to a network of rural service and market towns can make an important contribution to achieving economic growth and an equitable distribution of its benefits in both capitalist and socialist societies".

It is true that 'balanced development' is an elusive term but it implies a lessening or prevention of locational disparities in income and wealth. It must lead to progressive reduction in the differences in levels of living and opportunity between countryside and city. Further, there cannot be, *a priori*, a universally optimal pattern of settlement. Its desirability has to be judged in relation to national policy objectives and development goals. The policy may seek interregional equity or rapid industrialisation or equitable economic growth in which both rural and urban populations can benefit from development; and accordingly the most appropriate spatial pattern would be different.

Advocates for developing secondary cities believe that the appropriate spatial structure for promoting economic growth with social equity is a more diffuse pattern of urbanisation. Their arguments have evolved, on the one hand, from a reaction against the supposed 'trickle-down' effects of the high returns on concentrated investment in the largest metropolitan areas and dissatisfaction with optimal city size theories and prescriptions of rank-size distribution. On the other, they question the efficacy of theories of widespread distribution of national investment in rural areas to stimulate 'bottom-up' development.

The author quotes a study based on a number of developing countries which shows that the growth of large metropolitan areas has produced a 'back-wash' effect which drains rural hinterlands of their capital, labour and materials. Advocates of balanced urbanisation, therefore, argue that trickle-down processes cannot be made effective without "a well articulated and integrated system of settlements through which innovation and economic stimuli can be diffused". In a situation of scarcity of resources that most developing countries face, dispersing investment widely fails to produce the critical mass needed to generate economic and social change. To prevent or reverse polarisation and stimulate rural economies development of secondary cities can play a crucial role by promoting a more diffuse pattern of urbanisation.

### WHAT ARE SECONDARY CITIES?

In arriving at a definition of secondary cities, the author notes that the range of cities that constitutes secondary cities varies among different countries depending on their patterns of settlements, levels of development and economic structures. Most analysts expect secondary cities to perform central place functions —they must serve people living outside their boundaries. Other suggest that their functions must also be interactive; they should "connect, transfer and disseminate, and they should serve as channels for the flow of goods and services, mediate social relationships, and diffuse modernisation influences". Population size is a readily available and useful initial criterion for defining secondary cities, since a large body of empirical evidence shows positive correlation between city size and functional complexity. The author suggests a range of city sizes that can constitute secondary cities, from at least 100,000 people upto but not including the largest city in the country.

Secondary cities tend to have a combination of rural and urban socio-economic characteristics. They have relatively more heterogeneous population as compared to rural areas and small towns; their economies are dominated by commerce and services and their industrial sector is composed of small scale industries; they tend to have a small share of the nation's manufacturing and employment; small secondary cities tend to have larger proposition of their labour force engaged in agriculture and related employment while cities over a million population have relatively high proportion of employment in manufacturing. Variation in the economic structure of secondary cities can be explained partly by their economies of scale.

Based on several case studies of cities from a variety of countries, the author presents a number of functions that secondary cities perform and which are important for regional and national development. He, however, cautious that the case studies reviewed do not allow a universal generalisation about the potential of secondary cities; what is presented are common characteristics which can be considered hypotheses which must be tested in the context of individual countries before policies are formulated.

Secondary cities perform a mix of rural and urban functions. Because of their sufficiently large population they can offer economies of scale for conveniently locating various public services and facilities and also for establishing small scale enterprises. They act as centres of distribution of consumer goods and services and also as agricultural supply centres. They can absorb significant numbers of migrants. A crucial function they perform as regional centres of transportation and communication, is to link their residents and those of their hinterlands to larger cities and other regions of the country. Communication networks are vital not only for the growth of secondary cities themselves but also for the creation of other secondary cities and growth of market centres and for stimulating agricultural production in their hinterlands. Secondary cities can be effective centres of social transformation by accommodating social heterogeneity and organisations to help socialise rural people into city life. They can also offer opportunities for social and economic mobility.

All secondary cities do not perform all of the functions and some do not perform them well; generally they perform a weak role in the national development. One of the common reasons is that due to deliberate policies of governments to invest in metropolitan centres, "these cities have received a disproportionately low share of national investments in infrastructure, services, industry and other activities compared to the largest city".

### STRATEGIES FOR SECONDARY CITIES

In devising strategies to strengthen secondary cities, it is important to distinguish between 'developmental' cities and those that are 'exploitational' so that developmental functions can be built upon. From available case-studies, the author provides insights into those factors which facilitate widespread development of the region. One of the important factors is the degree of support from the national government for internal growth and development of the city to ensure that resources are not drained away to support the development of metropolitan centres or the national economy. What is equally important is the linking of economic activities within the city to the city's hinterland through mutually beneficial processes of exchange to serve the needs of the rural people and promote higher productivity and greater distribution of income for the rural population. Other factors are related to the degree to which local elites and leaders identify their own success with that of the region, how far they are innovative themselves and successfull in bringing external resources to the city and how far they promote social and behavioural changes. Further, for secondary cities to be developmental, economic activities have to be organised in a manner that creates income for local residents and promotes internal demand for goods and services that can be produced and distributed locally.

The author points out yet again that each country must evolve its own strategy for the development of secondary cities, "to meet its own national economic objectives within its own resource constraints, and at pace with its own economic, administrative and technological capacities". International assistance organisations can help in finding appropriate ways to strengthen economic and service delivery capacities of secondary cities. There are two areas in which assistance can be given: in formulating national urbanisation strategies for developing well-integrated systems of secondary cities and in helping city governments to solve the complex problems of managing urban growth. Given the constraints on resources the objective of promoting more balanced urbanisation and greater social equity in the distribution of benefits can only be approached incrementally. This may involve unequal distribution and investment of resources among cities and regions in the country.

A national strategy for developing secondary cities will require simultaneous action on various fronts. In the existing secondary cities basic social services and municipal facilities will have to be extended to support productive activities and improve human resources. Their physical structure will have to be improved to make them efficient and conducive for productive economic activities. Their economic base and employment structure will have to be strengthened and the planning, administration, and financing of urban development management will have to be reorganised. It will also be necessary to stimulate the growth and diversification of small towns and market centres to improve the geographic distribution of secondary cities in the country. Further, an essential part of this strategy will have to be to strengthen the physical, economic, social and political linkages among secondary cities and between them and smaller and larger settlements so that they perform developmental functions more effectively and benefits of economic development spread widely.

### COMPLEMENTARY POLICIES

All this is not enough, the author warns, to promote secondary cities as catalysts for regional development. What is also required is the formulation of "complementary social and economic policies that are conducive to widespread urban growth. Current patterns of urbanisation often reflect and are influenced by non-spatial development decisions. Policies on import substitution, trade regulations, foreign investments, migration control, monetary regulations, tax, wage and price laws, land reform, and the structure of government organisation may all, indirectly, affect the spatial pattern of economic development within a country and determine the degree to which secondary cities can compete with primate cities or national capitals." In addition to laying down policies to deal with the above, it is equally important to restrict or slow down the growth of primate cities in order to encourage the development of secondary cities.

The author further adds that part of the strategy for developing secondary cities must also deal with a number of common problems which arise with greater concentration of people and economic diversification. Underlying any strategy, there "must be a set of strong policies for increasing the income and purchasing power of the large numbers of poor people living in intermediate urban centres". Towards this end, "improving the living conditions of the poor, expanding their skills, raising their levels of educational attainment, improving their health and raising their incomes must be viewed as long term investment in the internal economies of secondary cities". The author then discusses measures to deal with such problems as rising land costs, housing shortage and proliferation of squatter settlements, poor quality of basic municipal services particularly in poor neighbourhoods, strain on transportation services, difficulties in expanding secondary and tertiary sector employment and municipal finance.

As the author makes clear in the preface, we still know relatively little about the potential of secondary cities for development and his study attempts to establish the beginning and the direction of a long road. Its purpose is to raise questions and intensify the debate over the role of secondary cities. This it does admirably.

The book draws conclusions from a number of case studies of cities from a range of developing countries which are different in their population sizes, political economies, levels of urbanisation and industrialisation, rates of economic growth, and degrees of poverty and disparity between rural and urban areas. It is difficult to reach consistent conclusions from examples from such a big range of different contexts.

The author points out at the outset that one of the strongest reasons for increased interest in the development of secondary cities is the unrelenting growth of largest metropolitan centres and the social and economic inequities associated with spatial polarisation. The author states that according to many development theorists rural impoverishment results directly from the growth of the largest city. It must, however, be noted that there are others who believe that the political alliance (as in India) between the rural oligarchy and industrial bourgeoisie is itself inimical to growth and that the rural poor, urban working class and fixed income groups have to bear the brunt of the resulting economic costs of the alliance. In this situation, is it likely that secondary cities would effectively play the role of catalysts for rural and regional development?

# The Union Budget, 1985-86

## An Appraisal

**K Sundaram**
**Suresh D Tendulkar**
**K Krishnamurty**

*The Union Budget for 1985-86 signals a distinct break with the past on three counts: (a) it implies a shift in the ex-ante composition of investment away from the public sector and towards private corporate sector; (b) the incentives offered in the Budget are neutral as regards the choice between consumption and savings; and (c) the fiscal concessions aim at transferring the transactions from the so-called black or the unaccounted segment to the white or accounted segment of the economy. These are all indicative of a significant change in the perceptions of the policy-makers regarding the mainsprings of the Indian growth process.*

*This paper attempts to examine these changed perceptions in the context of the long-term implications of the policy initiatives in the Budget for the Seventh Plan. Second, it seeks to assess the short-term price consequences of the Budget proposals.*

### I

### Introduction

THE Central government Budget for the year 1985-86 deserves a serious discussion for at least three sets of reasons. To start with, the Finance Minister has promised 'the formulation of a long-term fiscal policy coterminous with the (Seventh Five Year) Plan' of which the present Budget can be regarded as a precursor. A stable policy environment, it may be noted, is particularly important for influencing the long-term decisions of the private economic agent. Secondly, the long-term policy-initiatives have been taken *before* the finalisation of the details of the Seventh Plan. It is the Seventh Plan that has to adjust to these policy initiatives in terms of the size and composition of plan investment. Thirdly, the Budget signals a distinct break with the past on three counts: (a) it implies a distinct shift in the *ex ante* composition of investment away from the public sector and towards private corporate sector, (b) the incentives offered in the Budget are neutral as regards the choice between consumption and savings, and (c) the fiscal concessions aim at transferring the transactions from the so-called black or the unaccounted segment to the white or accounted segment of the economy. These are indicative of a significant change in the perceptions of the policy-makers regarding the mainsprings of the Indian growth process.

This paper has two objectives. First, it attempts to examine these perceptions in the context of the long-term implications of the policy initiatives in the Budget for the Seventh Plan. Secondly, it seeks to assess the short-term price consequences of the Budget proposals. An increase in prices consequent upon the Budget erodes real incomes. This erosion in varying degrees, is offset by the direct tax concessions. The net effect spells out the overall distributive impact of the Budget.

With these objectives, Section II starts by summarising the relevant features of the 1985-86 Budget before discussing the implications of the Budget for the public sector plan (Section III). An inevitable reduction in the size of the public sector plan leads to a discussion of the relative importance of the private sector which could respond to the stimulii offered in the Budget (Section IV). This is followed by an elaboration of the constraints that may operate on the economic growth process visualised in the Budget (Section V). The implications of the Budget for the poor are examined in Section VI. This completes the discussion of the long-term implications of the policy-initiatives in the Budget. Short-term price consequences of the Budget are investigated in Sections VII to IX. The announcement effects and the cost-push effects of the Budget are discussed in Section VII. An estimate of the money-supply expansion consequent on the Budget is presented in Section VIII. This is followed by an assessment of the effect of money-supply expansion on prices.

### II

### Major Features of 1985-86 Budget

As a backdrop for the analysis of the long-term implications, we sketch the relevant features of the stable fiscal environment outlined in the Budget.

The Finance Minister has sought to rationalise and simplify the structure of direct taxes along with a downward revision in the rates of income, wealth and corporate taxes and abolition of Estate Duty.[1] The expectation underlying these measures of rationalisation is that this would not only induce better tax compliance but also bring about a shift of transactions from the so-called 'black' or unaccounted to the accounted segment of the economy.

Apart from the rationalisation of direct taxes, the Budget highlights the severe erosion of the 'budgetary resources for the Plan'. Non-Plan expenditure is admitted to have been increasing at a rate substantially faster than the growth of current revenues. Thus the total non-plan expenditure is estimated to increase by more than 10 per cent in 1985-86 over the 1984-85 Revised Estimates. This may be compared with an increase of a little over 7.5 per cent in gross tax-revenue at the existing levels of taxation. Consequently, the balance of current revenues over non-plan expenditure declines sharply from Rs 2,500 crore in 1984-85 (Revised) to a little over Rs 700 crore in 1985-86 (Budget).

Another feature of the Budget is the remarkably modest nature of the effort at additional resource mobilisation especially for a post-election Budget. Apart from Rs 464 crore sought to be mobilised through the railway Budget, the additional resource mobilisation in the Union Budget, net of concessions, would be Rs 500 crore. This last may be compared with the Budget estimate of Market Borrowings of Rs 5,100 crore and deficit financing of Rs 3,348 crore.

A consequence of the first three features noted above is the severe resource constraint facing the Seventh Plan. As the Finance Minister has emphasised, "as we enter the Seventh Plan, the resource constraint has become acute, both at the Centre and the states" (Para 11). It is to a consideration of this question that we now turn.

## III

## Budget and Public Sector Plan

It may be recalled that the Approach to the Seventh Plan postulated a total Plan outlay of Rs 320,000 crore and a public sector outlay of Rs 180,000 crore at *assumed* 1984-85 prices projected at the time of the formulation of the Approach document in mid-1984. It may also be mentioned that the size of the public sector outlay was reaffirmed after the new government came to power in January 1985. It is reported that the annual rate of inflation assumed in the Approach document was of the order of five per cent per annum for each of the years 1983-84 and 1984-85. However the actual rate of inflation has turned out to be 12 per cent for 1983-84 (average of 12 months) and estimated to be eight per cent for 1984-85 on the same basis. Consequently, the maintenance of the same public sector plan in physical terms as postulated in the Approach document at the realised 1984-85 prices would require a higher public sector outlay—one guesstimate places it at around Rs 190,000 crore.

Moreover, the total size of the Seventh Plan and of the public sector outlay was predicted on a gross domestic savings rate of 26 per cent of GDP through the plan period. The realised gross domestic savings rate in the first four years of the Sixth Plan did not, in any of these years, exceed 23 per cent.[2] While strongly emphasising the resource constraint, the Budget speech of the Finance Minister is singularly free from the usual exhortations on the need to step up the rate of savings in the economy. Further, the fiscal package announced in the Budget seeks to raise the disposable income in general and does not influence the choice of the individuals and other tax-entities between savings and current consumption. If anything, the package appears to aim at raising the effective demand for certain consumer durables whose capacity expansion in the private sector is being consciously encouraged.[3] If this is to be a stable feature of the fiscal policy over the Seventh Plan, we cannot expect the gross domestic savings rate to rise from the realised level of around 23 per cent.

The public sector plan outlay can be maintained in real terms in the face of a lower than anticipated rate of domestic savings if much more reliance is placed on external finance and/or if private sector investment is crowded out by transferring private savings to the public sector through non-fiscal/non-tax instruments (as fiscal concessions in the Budget are expected to be stable over the plan period).

As regards external finance, we have the Finance Minister's own assessment that the 'availability of external resources for development' has not only dwindled but that their terms have also become 'distinctly harder'. Commercial borrowings are also termed 'expensive'. Given this perception and given the fact that public sector infrastructural investments typically carry a low rate of return even under ideal circumstances, a larger dependence on external finance for maintaining the public sector outlay can be ruled out on current reckoning.

Turning to the possibility of crowding out private investment, we have to consider the corporate and non-corporate components separately. The prospect of squeezing private corporate investment is quite inconsistent with the philosophy of the Budget and the fiscal concessions already announced and those "to be introduced in a phased manner". The crowding out of non-corporate private investment cannot be ruled out but it would be inconsistentt with the policy of encouraging the modern small scale sector and the new brand of "small" entrepreneurs.

Even though the crowding out of private investment is inconsistent with the philosophy of the Budget (and ruling out tax instruments for resource mobilisation) other instruments of resource mobilisation such as deficit financing and increases in the administered prices of public sector's products and services, may in effect have the consequence of crowding out private investment. As regards deficit financing, whatever be the ability of the economy to absorb the extent of deficit financing in this year's Budget without inflationary consequences (more on this later), it is surely obvious that raising deficit financing to a status on par with taxation as a major source of plan-finance cannot but carry with it dangers of a major inflationary spiral.

Raising the administered prices of public sector products and services is one of the ways of raising additional internal resources from the public sector enterprises. The failure of these enterprises tc generate surpluses can be traced to a variety of factors of which the major ones include overstaffing and other managerial and organisational constraints, out-dated technology and pricing policies. Given the managerial, organisational and technological constraints, the exhortations of the Finance Minister for "better utilisation of existing capacity and higher returns on past investment" (Part A, para 13) are no more than rhetoric. Raising the administered prices remains the only relevant medium term alternative. Over the past several years, raising the administered prices, often outside the Budget, has become a major instrument for resource mobilisation by the public sector.

In assessing the policy alternative of raising administered prices, two features of the public sector may be noted. First, products and services produced by the public sector enterprises mostly constitute universal intermediate inputs into a large variety of economic activities. Secondly, intra-public-sector transactions in these

goods and services are sizeable. Consequently, any increase in the prices of these goods and services has the effect of raising the material input costs throughout the economy including the public sector enterprises themselves. These increased costs, if absorbed without price increases, would adversely affect the rate of return on capital and hence profitability. Alternatively, if these increased costs are passed-on to users/consumers in the form of higher prices, they would lead to spiralling prices. This cost-push based price spiral can be accentuated by cost-push impulses following from the rise in factor costs consequent upon the price increase (e g increased dearness allowance). To top it all, the cost-push based price spiral can trigger price-expectations which fuel the inflationary process on the demand side. Also, with its uncertain consequences for the size and composition of real investment, what is it that remains 'planned' in this scenario?

If additional external finance, cutting-down of the private sector component of the Plan and inflationary financing of public sector outlay are all ruled out, the only alternative is to cut the size of the public sector plan. This is a direct consequence of the philosophy of the Budget and no prior discussions in this regard appear to have taken place between the Planning Commission and the Ministry of Finance.

| 1985-86 A | 9334 |
| B | 9267 |
| C | 9149 |

Reports suggest that the public sector outlay may be revised downwards to Rs 167,000 crore at the realised prices which are higher than assumed in the Approach document. This is about 12 per cent lower than the guesstimate of Rs 190,000 crore mentioned earlier. Consequently, the physical content of the public sector plan as visualised in the original Approach document cannot be maintained except possibly through lowering the capital output ratios by higher capacity utilisation. The latter alternative has indeed been aired recently without indicating the nature of excess capacity, the reasons for underutilisation as also the constraints on better utilisation. At any rate, nothing has happened since the formulation of the Approach document to believe in a sudden emergence of this alternative. If this knowledge was available earlier it should have been taken into account in assessing the requirements of investment in the Approach document itself. Any attempt to maintain the same physical plan with lower outlay carry with it the real danger that the new projects included in the Approach document are initiated without enough resources to see them through to completion. This would inevitably lead to time and cost over-runs and lower overall productivity of investments.

Whether public sector outlay is Rs 167,000 crore or Rs 190,000 crore is, by itself, not particularly important. Public sector investment should not be raised to the status of being an end in itself. It is an instrument for promoting the Plan objectives of growth and poverty reduction. Given the close inter-connections between infrastructural services and private economic activity, and given the under-investment in major sectors such as railways, power, coal, irrigation and flood-control since the mid-sixties and given that these investments account for the bulk of public sector investment, a rational cut-down in the physical content of the public sector plan would not be an easy exercise. It may be readily conceded that there exist substitution possibilities in the short-run among alternative energy sources as also between rail and road transport. However, the infrastructural services, being non-tradable, may pose a bottleneck in the next few years for the expansion of the private-sector economic activity itself which is sought to be encouraged by the present Budget.

Given that the infrastructure sector can potentially be a major constraint on the growth process, the modest step-up of six per cent in the Central Plan outlay as a whole and increases of under 10 per cent in the outlays on coal, and lignite, and irrigation and flood control appears utterly inadequate. For, with a double-digit inflation in terms of wholesale price index predicted for the fiscal year and the tendency noted over the past several years for the prices of investment goods to rise faster, outlay increases of under ten per cent would in all likelihood mean a *lower* real investment in 1985-86. Particularly disturbing is the case of railways where the nominal investments have just been maintained at the 1984-85 levels, which would imply a significant reduction in real investments, in a situation which calls for a massive investment in the sector. It is only in the power sector that we see a welcome step-up in real investments with a 33 per cent step-up in the public sector plan outlay.

## IV

## Budget and Private Sector

An inevitable reduction in the physical plan of the public sector during the Seventh Plan is indicative of a significant change in the perception of the policy makers. The received wisdom upto now had been based on the implicit or explicit judgment that the complementarity between the public and the private sector investment in a dynamic context far outweighted the immediate impact of possible crowding out of private investment.[4] So that, the maintenance of certain public sector investment was deemed to be an essential catalyst to the growth process. The fiscal concessions granted to the corporate sector in this Budget, and further concessions promised for the future and the resulting reduction in the physical content of the public sector plan implies a significant change in perception. The changed perception seems to be that the extent of complementarity between the public and the private sector has been weakened and that the crowding out of private corporate investment needs to be minimised. A corollary of this judgment is that the Indian growth process can be sustained on the basis of private enterprise with only a supporting role being played by the public sector in providing infrastructural services. This judgment though not explicitly spelt-out offers a possible rationale for the policy-package.

A central premise of the fiscal concessions offered in the Budget is that it would stimulate a significant output and employment response, besides inducing better tax-compliance and a shift of transactions from the 'black' to the accounted segment of the economy. When reduced tax rates are expected to bring about a significant output response, the assumption is that the supply elasticities are potentially high but that the supply-response is being inhibited by the disincentive effect of exorbitant direct taxes.[5]

Before examining the question of whether or not the constraints on output expansion perceived by the Finance Minister are the only ones or even the binding ones, let us first get two points out of the way. First, if one accepts the premise that a lowering of tax rate would induce both individuals and corporations to *report* a larger proportion of their true outputs and incomes, this being the essence of the notion of better tax-compliance, then the increase in the *reported* or accounted (in contrast to unaccounted) outputs/incomes between say 1984-85 and 1985-86 would, to the extent of such better compliance, be purely illusory. An appropriate "discount" factor would have to be applied to the growth rate that might be recorded in the National Accounts.

The second point is even more important. This relates to the relative size of the tax-paying population who, on the stated assumptions, would be enthused by the tax-cuts to raise their outputs/incomes (and not merely *report* a larger proportion of their true outputs/incomes). The Finance Minister's speech refers to four million assessees out of which one million would go out of the tax net because of the raising of the exemption limit. Even as a proportion of the work force of 300 million or more this is a drop in the ocean. On the output side, we may take the total value added in the organised private sector outside agriculture and add to it the *total* value added in the legal, medical, business and health services (though the last item has a sizeable public sector component) as the segment potentially responding to the changes in the direct tax regime. Altogether, these accounted for less than 14 per cent of net Domestic Product in 1981-82—the latest year for which such details are available. While a faster growth in output and income would be welcome wherever it occurs, the fact that less than one-seventh of economic activity is potentially capable of responding to the stimulus provided by the direct tax-cut, must temper one's expectations of the overall growth impact of the fiscal concessions announced in the Budget.

## V

## Constraints on Growth Process

Even if one were to disregard the dimensions of the potential increase in growth resulting from the stimulus provided by the reduced rates of direct taxes, there still remains a question whether lack of demand or what we may call the size of the market, may not prove to be the most important factor constraining a broad-based and sustainable output expansion. Given the high cost, low-quality, domestic industrial structure and the marginal role of external markets, the size of the domestic market can be taken to be the decisive one. In this context the Budget, both directly and indirectly does offer a stimulus for domestic market expansion. Directly, the impact of the Budget would be to raise disposable incomes of at least some of the direct tax payers i e, those who are able to maintain their real incomes against erosion due to price rise consequent upon the Budget. This should stimulate demand at least for certain types of goods and services. Indirectly, and this could be potentially more important, by reducing the incentives to evade taxes and thereby possibly enlarging the proportion of white or accounted income it can switch demands. The demand switch could be out of what was previously black or unaccounted income from goods mostly with low supply elasticity (gold being the extreme example) towards goods with higher supply elasticities—mostly high technology, high quality consumer durables. Nevertheless, it is on the question of sustainability of demand that we would like to sound a note of caution.

It is certainly true that there exists today a sizeable pent-up demand for a variety of consumer durables, especially passenger cars, TV, videos and other electronic products which have a certain minimum acceptable quality. The long waiting list for Maruti cars or the premium commanded on 'foreign' consumer goods are indicative in this regard. A problem, however, arises when domestic production capacity is rapidly expanded on the strength of such pent-up demand. The pent-up demand, especially in the case of consumer durables, may turn out to be of a once-over kind with replacement demand from year to year being relatively much smaller in magnitude. Thus, one can certainly visualise a sharp increase in the production of a wide range of such consumer durables—especially if foreign tie-ups are permitted—for the coming few years on the strength of such pent-up demand. But the real question is whether the capacity created domestically can be fully utilised beyond the initial few years once the pent-up demand is satisfied. This resolves itself into two further questions. (a) Whether there will be adequate domestic demand on a sustained basis; and (b) whether it would be possible to break into the world markets in these products. There are serious doubts on both counts.

As regards prospects for exports, with a policy of passive acceptance of foreign technology—and there is no real push for technology adaptation and innovation—it is extremely doubtful whether we would be able to effectively compete in the international markets in these product lines. These doubts are further strengthened by the fact that we still have far too many producers each producing on a scale which prevents any meaningful realisation of the scale economies.

Apart from replacement demand, the level of sustainable new demand for these consumer durables depends, in turn, on the growth in incomes and on its size distribution. On the question of the growth in incomes, it is important to distinguish between growth in value of gross output and the growth in domestic value added. If the Maruti pattern becomes the dominant mode for the expansion of domestic output of these consumer durables, given its high import-content, the impact on domestic value added would be rather limited. Equally important is the size of the segment of the economy subjected to the growth stimulus arising from fiscal concessions. We have already seen that this segment is quite small.

It might be countered that we are neglecting the generation of secondary incomes in the workshops servicing these additions to the stocks of consumer durables. Given a large proportion of new consumer durables in the total stock, the demand for servicing may not be very significant for quite some time. In addition, those earning these incomes are unlikely to be able to afford these very consumer durables. It may also be suggested that we are neglecting the demand expansion that can originate in the growth in agricultural incomes at higher rates than realised in the past. Without going into the larger questions of the constraints on agricultural growth and whether the Budget can or does relax these constraints, the following statement can be stressed. Efforts at maintaining, as well as raising, the growth rates in agriculture would require the spread of growth impulses to newer areas—especially the Eastern region which is marked by the dominance of small and marginal farmers. And for a long time to come, they are unlikely to be in the market for the new consumer durables for which the domestic production capacity is being rapidly expanded with or without the import of foreign technology.

As for the size distribution of incomes, it may be possible to squeeze in a little extra demand for these consumer durables by making the size distribution of incomes more unequal. It must, however, be recognised that there is not much pay-off in that strategy. The basic limitation on the size of the domestic market for these consumer durables comes from the fact that even today our per capita income is extremely low. India is not Brazil: Brazil's per capita income is roughly eight times that of India.

The foregoing discussion has deliberately abstracted from the balance of payments considerations in order to highlight the limited size of the domestic market for the new consumer durables. Given their high import-content, the liberalisation of imports of capital goods and intermediates as also the prospect of a progressively rising import-bill of POL and products, the demand for imports may be expected to rise sharply. In the face of gloomy prospects for external finance and a rising debt-servicing burden, the balance of payments problems can be warded-off only if export expansion takes place on a considerably higher scale than in the past. While some acceleration in exports cannot be ruled out with the resumption of the growth—momentum in the OECD countries, whether this expansion would be adequate to meet the steeply rising import demand is an open question. Pressures on the balance of payments front may be expected to accentuate the problems of fuller utilisation of new capacity being created in the production of consumer durables.

A sizeable underutilisation of capacity in what are being today hailed as new growth points—arising mostly from the limited size of the market but also possibly from the foreign-exchange constraint—will not only prove a major deadweight that the economy will have to carry, but more importantly, may itself cause a reversal of the present policy-package.

## VI

## Budget and the Poor

It is against the backdrop of a mixture of limited hope about the growth-implications of the present policy-package in the immediate future and anxieties about the long-term sustainability of even the limited growth impacts of the Budget that we must consider the Plan objective of poverty reduction. One, of course, presumes that this still remains a Plan objective!

Obviously, the poor, howsoever defined, are no going to be among the direct beneficiaries of the tax-cuts announced in the Budget. Indirectly however, the poor can benefit, at least in principle, through additional employment-generation resulting from the policy-package presented in the Budget. In fact, the Finance Minister has claimed that "measures being taken now to stimulate the economy will have an important beneficial impact on the employment situation" (Part A, para 19). We have already seen that the private corporate commodity-production segment which is likely to be stimulated by the Budget account for less than a tenth of the value added in the economy. Given the relatively high degree of capital intensity in this segment, the employment consequences of any output expansion would be quite small in relation to the overall employment situation in which about eight million workers get added to the labour force every year. If, as indicated earlier, the Maruti pattern of output-expansion becomes the dominant pattern in the "high growth" segments, then the value added element, and within that, the employment component, would be even smaller.

As regards the direct expansion in service activities stimulated by the Budget, the Finance Minister has referred to "employment-oriented activities, such as, consultancy and advertising services and services for promotion of tourism". If this is all it amounts to, the so-called employment effect of the Budget can hardly be

of much consequence—especially for the poor.

Even the indirect employment effects —especially in servicing activities—related to the expanding outputs of the new brand of consumer durables—may be quite limited. This would be so not merely because the servicing requirements would be limited in the initial few years. Even at a later date, a widespread diffusion of the servicing activities tied to the expansion in these consumer durables would be critically dependent on easy and widespread availability of imported spares. Apart from this, there is the more important question whether the enlarged demand for servicing facilities translates into employment for larger number of people or fuller employment for those already at work with varying extent of slack in the shape of unutilised labour time and underutilised capital equipment. In any case, these activities require a level of training as a pre-requisite that would preclude all but a handful of the poor.

If the foregoing arguments are accepted, the favourable employment effects of the tax-cuts and the resultant stimulus to the economy can only be of marginal relevance to the mass of poor. On the other hand, the poor, who are unorganised and geographically dispersed, may be unable to maintain their real incomes in the face of the price-rise resulting from higher indirect taxes, higher administered prices and deficit financing. On balance, therefore, the poor would find themselves among the losers.

For any meaningful positive effects of the Budget on poverty, one has to turn to the expenditure side. Among the measures paraded as being 'for the poor', the two relating to the organised industrial workers, however welcome and necessary, can by no means be said to be for the poor. The simple reason for this is that the class of organised industrial workers do not, in general, belong to the core set of poor, defined in terms of certain normatively specified absolute minimum level of living. The two other measures are: (i) crop-insurance, and (ii) a social-security scheme to cover the risk of death by accident in respect of earning members of poor families. These schemes are welcome as far as they go. One is however intrigued by the omission of coarse grains from the coverage of crop-insurance. For, they account for a sizeable proportion of the cropped area of the small and marginal farmers, and in the arid and semi-arid areas. More importantly these insurance schemes can at best *prevent* someone from sinking below or further into poverty in the event of a disaster. They are not intended to be nor can they ever be a part of a package of programmes aimed at *raising* the income levels of the poor—either on a permanent basis or even as a temporary supplement, in *normal* times.

The Budget maintains, in nominal terms, the expenditure on special target-group oriented anti-poverty programmes such as IRDP, NREP and RLEGP—at the levels of the 1984-85 revised estimates. Given the likelihood of higher prices in 1985-86, the real size of these programmes will be lower. Recent discussions have highlighted the design and organisational deficiences which have limited the effectiveness of these special anti-poverty programmes in reducing poverty.[6] These deficiencies, while removable, necessarily require time for reform at the grassroots level. Therefore, the *size* of these programmes *per se* is less important than its effectiveness as an instrument of poverty reduction. The effectiveness of these special programmes has also been limited by their being designed in isolation from the general development programme.[7] If they continue to remain unintegrated with the general development programmes their size as well as impact on poverty would continue to the marginal. In such a situation one will have to look to the size and content of the general development programmes and therefore to the size and composition of the *plan as a whole*, for any major impact on poverty.

## VII

## Budget and Prices: Announcement and Cost-Push Effects

Analysis of the impact of the Budget for 1985-86 on the economy during the fiscal year 1985-86 will be primarily focused on the question of prices.

The focus on prices should occasion no surprise since the effects of the Budget on the real side of the economy *within* the fiscal year would be relatively less significant. Thus, the capacity creation impact of any of the capital expenditures proposed in the Budget can translate into higher real output only in the subsequent years. The presence of excess capacity and the extra demand generated by the Budget need not automatically translate into higher real output if there are other non-demand factors constraining capacity utilisation. Even the incentive effects of the tax-cuts, in terms of higher real outputs, apart from being confined to a small segment of the economy, are likely to manifest themselves significantly, if at all, only in the years beyond 1985-86. Here the distinction between real increase in outputs and incomes and an increase in the reporting of larger incomes (consequent on lowered incentives for under-reporting) become quite important.

The clearest example of the weak and tenuous nature of the link between the Budget for a year and the levels of real output in the same year is provided by the agricultural sector. The significant role of weather in shaping the performance of the agriculture sector is too well-known to need any elaboration. No doubt changes in prices of diesel and fertiliser—resulting from the budgetary decisions—would affect the use of these inputs. However, one would still assert the dominant influence of moisture availability in conditioning the use of both fertiliser and diesel.

In considering the impact of the Budget on prices during the fiscal year we focus on three issues:

(1) The role of budgetary imposts as a factor lending apparent legitimacy to the increase in prices that are warranted by the objective demand and supply situation and are merely *timed* to coincide with the budgetary announcements. This may be called, for want of a better expression, the *announcement effect*;

(2) The cost-push impact of the increases in indirect taxes as well as in administered prices especially on the intermediate goods; and

(3) The effect of deficit financing on prices.

We consider the first two in this section.

The announcement effect of the Budget and the cost-push effect need to be considered together. The former refers to the rise in prices of final consumption goods that takes place in the immediate post-Budget period in excess of the cost-push effect that can be legitimately attributed to the Budget and the effect of any increase in indirect taxes on the final consumption goods themselves. A clearest illustration is provided by the rise in prices of privately supplied milk that has taken place in Delhi in the post-Budget period —roughly 10 per cent—by reference either to general rise in costs, or more often, citing the increase in the price of petrol and the consequent increase in transport costs. The real reason, of course, is provided by the fact that with the price of the government-supplied milk being raised the private milkman makes the correct judgment that there would not be much of a cut in demand for his milk.

Note that in assessing the effect of a hike in the prices of universal intermediates (railway freight or electricity or POL products) it is not sufficient merely to consider the share of the input-in-question in the cost of the product and the increase in the price of that particular input or service. To illustrate, the effect of a 10 per cent hike in railway freight tariff on the cost of a commodity in which the direct cost of railway freight is only 10 per cent of the total costs, is *not* just one per cent. For, the hike in railway freight also tends to increase the costs of all other commodities entering into the production of the commodity in question as inputs and the prices of the inputs of these other commodities and so on. Therefore, the cost-push effect of a hike in prices of all intermediates such as electricity, coal, power, cement, steel, POL products can only be assessed in the framework of input-output analysis which takes into account the direct and indirect effects. Incidentally, whether the prices of these intermediates are directly increased or raised through an *ad valorem* tax on the same is immaterial as far as the cost-push effects of these price increases are concerned.

Consequent upon the railway and the general Budgets, there has been an increase in the prices of POL products, cement and railway freight. Iron and steel products, whose prices were raised a few weeks prior to the Budget, should also be included in the set of universal intermediates whose prices have been raised as part of the policy-package. Rise in the administered prices of other universal intermediates produced in the public sector, even within the fiscal year 1985-86, cannot be ruled out.

Apart from the above mentined universal intermediates, the prices of certain final consumption products such as vegetable oil, aerated water and cigarettes have been subjected to higher and indirect taxes, thus pushing up their prices. Depending on the weight of these final consumption commodities in the index of wholesale prices, the direct impact on the wholesale price index can be calculated. In addition, we have the case of hikes in railway-passenger tariffs which curiously has no weight in the wholesale price index, even though the loss in purchasing power of the consumers is real enough.

As regards the cost-push impact of an increase in the prices of the set of products and services whose prices are administratively fixed in general and of the universal intermediates in particular, we have a study in inter-industry framework by Gupta and Srinivasan.[8] They divide the input-output sectors into two broad categories—the goods and services whose prices are administered and the rest. The analysis assumes that while the cost-increases are fully passed on in the non-administered part of the economy, the cost increases in the administered sector are absorbed within the sector by squeezing the surplus accruing to capital. The effect of a rise in administered prices on costs and hence on prices while taking account of inter-industry linkages assumes away the possible increases in factor costs consequent upon the increase in prices by way of higher dearness allowance, etc.

Gupta and Srinivasan show that a rise in one single administered price at a time, does not have any significant impact on the wholesale price index. Thus even a hundred per cent increase in the price index of chemicals and fertiliser leads to only 5.5 per cent increase in the wholesale price index. In the case of other universal intermediates such as coal and lignite, cement, electricity, iron and steel and railways, the impact on the wholesale price index of doubling the price of each one of them, one at a time, is even lower.

However, they emphasise that when the set of administered prices go up in a package either simultaneously or within a short interval, the collective impact on the wholesale price index of all commodities could be and has been sizeable with an elasticity of nearly one (0.98). Their rough calculation shows that "if this secondary effect, i e a consequential increase in factor price, is taken into consideration then this estimated elasticity may even go up to 1.3".

## VIII

## Budget and Money Supply Expansion

We turn now to the implications of the Budget for the expansion in money supply.

To start with the revenue and expenditure forecasts presented in the Budget are taken as given. If the revenue receipts are smaller and the expenditures higher than forecast in the Budget, *ceteris paribus*, the size of the budgetary deficit and the consequential expansion in money supply would be larger than what we have indicated below.

The budgetary deficit, defined as the RBI's credit to the Central government against treasury bills is placed at Rs 3,348 crore. However, even from the limited point of view of indicating the addition to high powered money implied by the budgetary proposals,[9] this figure represents a considerable underestimate on at least three counts.

First, the purchase by the RBI of long-term government securities on its "Own Account" is indistinguishable from RBI lending against treasury bills—at least as regards its effect on high powered money. Second, if the past practice of states running up overdrafts with the RBI continues, there would, in effect, be additional deficit financing. Third, we have already seen that intra-public sector transactions are quite significant and that raising the prices of public sector products—representing the so-called Additional Resource Mobilisation—by affecting the costs of other public sector enterprises substantially reduces the net contribution of the public sector taken as a whole.

On the question of the purchase of long-term government securities on RBI's Own Account, the figures for the latest four years for which data on ownership of public debt is available, are shown in Table 1.

It is seen from Table 1 that the lowest proportion of Market Borrowings purchased by RBI on its 'Own Account' has been about 22 per cent. In the Central Budget for 1985-86, net Market Borrowings of the order of Rs 5,100 crore is envisaged. Even if we assume that the proportion of Central government's Market Borrowings that the RBI ends up purchasing on its 'Own Account' to be only 22 per cent, as against the average of a little over 39 per cent reported for the first three years of the Sixth Plan, the addition to high powered money on this account alone would be as much as Rs 1,122 crore. If this is accepted, the addition to high powered money arising from the Central government Budget would be at least Rs 4,470 crore, i e, roughly Rs 4,500 crore.

The states, unlike the Centre, cannot directly indulge in deficit financing of the excess of their expenditures over their revenue and capital receipts including loans from the Central government. But then there are the state governments' 'overdrafts' with the RBI.

Since the overdrafts have to be cleared before the end of the fiscal year, the state governments either have to cut-back on their plan outlays or, if they can persuade the Centre, get more loans from the Centre—over and above the levels allocated in the Central Budget. In practice, a bit of both takes place. To the extent additional loans from the Centre replace the states' overdrafts with the RBI, the Centre's capital disbursements will turn out to be larger than originally budgeted. So, unless capital disbursements on other heads, mostly public sector Plan Investments, are correspondingly cut, the Centre, in turn, has to borrow more—either by issue of treasury bills or long-term securities. A part of the latter might again end up with RBI itself. Thus, a part at least of the increased deficit financing in the Revised Estimates—as against the Budget Estimates—in effect represents a conversion of the state governments' overdrafts into Centre's deficit financing.

The presentation of the state Budgets and the process of finalisation of the Annual Plans of the states for 1985-86 is not yet complete. Any guess of the likely order of additional deficit financing emanating from the states could be quite off-the-mark. But there can be little doubt that this will be sizeable.

Finally, we come to the distinction between gross and net 'Additional Resource Mobilisation' (ARM). Consider a simple example. The recent hike in railway tariffs is expected to yield an additional revenue of Rs 464 crore during the fiscal year 1985-86. This represents the gross ARM undertaken in the railway Budget. However, the very hike in railway tariffs will, *via* the inter-industry linkages discussed earlier, raise the prices of some of the commodities and services bought by the railways which would thus push up its expenditure. To that extent the net ARM would be lower. More importantly, the increase in the price of diesel—consequent upon the general Budget—would directly raise the operating costs of the railways, besides indirectly pushing up the costs of other items used by the railways. Similar would be the impact of the rise in cement prices which would increase the cost of concrete sleepers used by the railways. These too, would reduce the net ARM. As the range of public sector products whose prices are raised increases, the indirect cost-push effects become more important. There is also a spill-over to the states: if the prices of coal, lignite and oil are raised, it reduces the net surplus of the state electricity boards. Gupta and Srinivasan show that:

> there is a difference of 10 per cent between the gross and net increase in the volume of saving in the electricity sector generated by a given increase in the electricity rates. This may be even an underestimation of the difference between net to gross saving since it excludes the likely consequential increases in the factor prices. In addition, there will be a corresponding negative saving in all other administered policy sectors, because of a consequential rise in their material input costs. Thus, taking into consideration all the inter-related effects, the real resource increase in the public sector as a whole in 'net' terms may be even less by 50 per cent of the 'gross' increase (p 1582).

The railway Budget proposes an additional resource mobilisation of Rs 464 crore (after adjusting for the concessions announced in the Minister's reply to the debate). If the net ARM is placed at 90 per cent of the gross ARM, the surplus of the railways sector will be less by about Rs 50 crore.

It has also been reported that the net effect of the concessions announced in the Finance Minister's reply to the debate may be to increase deficit financing by about Rs 100 crore—essentially flowing from the cut in imposts on kerosene and diesel.[10]

Putting all the relevant numbers together we find that the increase in high powered money resulting from the operations of the Central Budget would at least be Rs 4,620 crore.[11] If we add to this a conservative estimate of the additional deficit financing on account of states 'overdrafts' at Rs 180 crore, the total increase in high powered money is likely to be Rs 4,800 crore rather than Rs 3,348 crore reported in the Budget.

In order to estimate the increase in money supply consequent upon the increase in high powered money we need to apply the money multiplier. Using the $M_1$ definition of money stock, the ratio of $M_1$ to high powered money has been estimated at about 1.6.[12] Even if we use a more conservative money multiplier of 1.4, the increase in money supply would be of the order of Rs 6,720 crore.

The stock of money supply ($M_1$) as of March 1, 1985 is placed at Rs 37,637 crore. This would imply that the projected increase in money supply could be as high as 18 per cent, during the fiscal year 1985-86. This would be so despite our acceptance in toto of the revenue and expenditure forecasts in the Budget and the use of conservative estimates of the extent to which state overdrafts' turn into Central budgetary deficit and of the money multiplier.

As regards the revenue forecasts, it is extremely, doubtful whether the assumption of 'better tax-compliance' netting Rs 200 crore under income-tax would materialise.[13] On the expenditure side, at least one item of the budgetary forecast has already become invalid. Thus, the Budget makes a provision of Rs 300 crore for the full year for the payment of additional dearness allowance to the Central government staff. However, the interim-relief and additional dearness allowance sanctioned as April 26—barely 40 days from the introduction of the Budget—will cost as much as Rs 417 crore. Thus, we already have an additional deficit of Rs 117 crore on this account alone. However, we still have over 10 months to go in the fiscal year. In the past, an inflation rate of 10 to 12 per cent has meant the grant of anywhere between 4 to 5 installments, if not more, of additional dearness allowance. Our own price forecast for the coming year implies a double-digit rate of inflation. With each installment of additional dearness allowance costing upwards of Rs 90 crore, the excess of realised expenditure over the budgetary forecast on this item alone would be well over Rs 400 crore.

## IX

## Money Supply Expansion and Prices

What would be the impact of the expansion of money supply on prices? We first take up the impact on sectoral prices using the econometric relationships estimated by one of us.[14] The relationship explaining the wholesale prices of food articles uses the following predictors: (a) foodgrains availability per capita; (b) real disposable income per capita; (c) the money supply ($M_1$) at the end of the current and last year as a ratio of current year real GDP (referred hereafter as adjusted money supply); and (d) lagged index of prices of food articles.

Given the comfortable foodgrains stocks of over 25 million tonnes, one may safely assume that the foodgrains availability per capita can be maintained for a population growing at the rate of about two per cent per annum. This is possible even in the face of a dip in the foodgrains output in 1984-85, and a possible further dip that is predicted for 1985-86 by agricultural experts, by drawing down the stocks.

With the rate of growth of around 1.1 per cent in per capita real GDP in 1985-86 estimated by us, we may assume a rate of growth of 1.2 per cent in real disposable income per capita in view of the fiscal concessions given in the Budget.[15]

The Appendix to this paper gives the details of alternative estimates of GDP that we have forecast for 1984-85 and 1985-86. Notice that our high variant A indicates a growth rate of 3.35 per cent for 1984-85 compared to 4 per cent indicated in the government's "Economic Survey". Our estimate takes into account a dip in foodgrain output for 1984-85, announced on April 24, 1985, and the inter-relationship between the GDP originating the manufacturing on the one hand and on the other, the lagged public sector GDCF and GDP originating in agriculture and allied activities. This is given in the Appendix.

Using our forecasts of real GDP along with $M_1(t)$ variables, we get a growth rate in money supply adjusted for real GDP (given in col 5 of Table 7 in the Appendix) ranging between 14.6 to 14.9 per cent.

Using the short-run elasticities given by Krishnamurthy and the above estimates of predictors, the predicted rate of growth of index of wholesale prices of food articles ranges between 8 to 8.5 per cent in 1985-86 over 1984-85. Notice that this would be a lower bound since we have ignored the dynamic effects of past behaviour of the prices of food articles.

It is not easy to assess the impact of the rise in adjusted money supply on other sectoral prices in the same detailed fashion. However, in the study by Krishnamurthy, we also have estimates of the partial elasticities of sectoral prices with respect to the growth in the adjusted money supply, keeping other things such as sector-specific supply factors and cost-push factors constant. The index of wholesale prices for non-food articles has a (partial) elasticity of 0.75 while that for manufacturing and mining is 0.53 with respect to adjusted money supply. Given our forecast of a 15 per cent growth in adjusted money supply for 1985-86, we can obtain lower-bound estimates of the rise in the prices indices for non-food articles and manufacturing and mining by using the estimated partial elasticities. These turn out to be 11.25 per cent and 8 per cent respectively for non-food articles and manufacturing and mining.

Assuming a 10 per cent rise in the price index of fuel, power, light and lubricants, and using the weights in the wholesale price index, the rate of inflation would be about nine per cent. This is, however, very much a lower-bound estimate. For, it does not take account the cost-push and sector specific supply factors, the distinct possibility of the budgetary deficit being larger and last but not least the mutually inter-active relationship between Budget-deficits and price increases.[16] If we allow for these effects, there is no doubt that the rate of inflation, in terms of the wholesale price index, would certainly be at the two digit level.

As regards the elasticity of the GDP—deflator with respect to the growth in adjusted money supply, the short-run elasticity is estimated at 0.62 and the long-run elasticity is estimated to be one. This would imply that our forecast of the growth in adjusted money supply would have a short-run impact of nine per cent and a long-run impact of 15 per cent increase in the GDP deflator.

It may be stressed that while our forecasts of the price increases are predicated on our forecast of a 3.55 per cent growth in real GDP in 1984-85 and 3.2 per cent growth in real GDP in 1985-86, even a more optimistic assumption of a 4 per cent growth in real GDP in both 1984-85 and 1985-86 would not materially alter the inflation scenario. This would be especially the case once we allow for the possibility of the budgetary deficit being distinctly larger if only on account of the excess of realised expenditure on interim relief and dearness allowance over the budgetary forecast. In the final analysis, we may expect a rate of inflation of 10 per cent or more in 1985-86.

How does our assessment square with that of the Finance Minister? He has argued that since the economy had been able to 'absorb' a somewhat higher order of deficit in 1984-85, it would be able to do so during 1985-86 as well. It is worth considering what this 'absorption' meant. In this connection, we postulate that the rate of inflation in a given year is governed by the agricultural harvests of the previous and the current year as well as the growth rate of real GDP in the current and the previous year in conjunction with growth in money supply. Despite a comfortable supply position emanating from the bumper harvest of 1983-84 and a somewhat lower but still high harvest of 1984-85 and following on 8 per cent and 3.5 per cent growth rates of real GDP in 1983-84 and 1984-85, a 18 per cent increase in money supply generated an inflation rate of 8 per cent in 1984-85. Turning to the prospects for 1985-86, notice that following upon the slight dip in the output of foodgrains reported for 1984-85, agricultural experts anticipate an even lower foodgrains output in 1985-86. Also, our forecast of real GDP growth for 1984-85 and 1985-86 is only of the order 3.5 per cent per annum. Against this background and starting on a higher base of money supply, a further increase of at least 18 per cent is forecast by us for 1985-86. It should, therefore, be obvious that our forecast of a rate of inflation of 10 per cent or more for 1985-86 in no way contradicts the so-called 'absorption' of the 1984-85 budgetary deficit.

It would be a statement of the obvious that those outside the direct tax net and definitionally non-beneficiaries of the tax concessions would be the unmitigated sufferers of this inflation. Included in this dominant majority are the truly poor. As for the tiny set of income tax-payers, tax relief as a percentage of income-tax payable (including surcharge) at pre-Budget tax rates systematically declines with income. However, the tax relief as a percentage of pre-tax income almost systematically rises with pre-tax income level. Consequently, the extent of suffering of the tax-payers from inflation is being progressively compensated by tax relief with a rise in income level. The regressive impact of the 1985-86 Budget is thus self-evident.

## X

## Concluding Observations

We have argued that a stable fiscal environment promised in the Budget for 1985-86 implies a significant change in the perceptions of the policy-makers as regards the mainsprings of the Indian growth process. It implies a reduction in the physical content of the public sector plan during the Seventh Plan period, a much bigger role for the private corporate sector in promoting economic growth and a resulting weakening of the complementarity between the private sector economic activity and public sector investment (Sections III and IV). We have raised certain serious doubts about the broad-based nature and sustainability of the economic growth-process which is sought to be triggered by the new fiscal environment (Section V). The limited prospects for poverty alleviation emerging from the Budget proposals are outlined in Section VI.

The price consequences of the Budget are classified into two groups. Those due to the announcement effect and changes in administered prices (Section VII) and those due to money supply expansion planned in the Budget (Section VIII and IX), we conclude that at least a double-digit inflation appears inevitable with its regressive consequences.

## Appendix

### FORECASTING OF GDP MONEY SUPPLY VARIABLES FOR 1984-85 AND 1985-86

We have estimated the following regression relationships for the purpose of forecasting.

(1) $Y_1 = 2360.2756 + 129.689703\ x$

$r^2 = 0.9757$

where $Y_1$ = GDP originating in agriculture and allied services at 1970-71 prices

$x$ = index of production of foodgrains

period = 1964-65 to 1982-83

Elasticity at mean = 0.86

(2) $$Y_2 = \underset{(731.1862)}{-372.4112} + \underset{(0.130501)}{0.620319}\ x_1 + \underset{(0.066050)}{0.253177}\ x_2$$

Elasticities at mean level:

w r t $x_1 = 0.38$ $R^2 = 0.9450$

w r t $x_2 = 0.68$

where $y_2$ = GDP originating in manufacturing at 1970-71 prices at time t

$x_1$ = Gross domestic capital formation in the public sector at 1970-71 prices at time $(t-1)$

$x_2$ = GDP originating in agriculture and allied services at 1970-71 prices at $(t-1)$

period = 1965-66 to 1983-84.

Figures in brackets are standard errors.

Since the foodgrains output figures are available more readily, we use them in equation (1) to forecast the GDP originating in agriculture and allied activities. We use equation (2) to get the estimates of GDP originating in the manufacturing sector. Both the equations (1) and (2) are used to calculate the *increments* which are added to the level variable relating the earlier year to get the level for a given year. As regards the components of GDP excluding agriculture and allied services and manufacturing, we use the trend growth rate of six per cent per annum observed for the period 1973-74 to 1983-84.

Gross value added in agriculture and allied services for 1984-85 is based on three alternative estimates of the foodgrains output. A and B are official forecasts whereas C represents a non-official knowledgeable forecast. For 1985-86 we conservatively assume the foodgrains output to remain unchanged at realised 1984-85 level even though experts predict that there would be some dip compared to the 1984-85 level. This assumption of unchanged foodgrains output has the effect of keeping constant the GDP originating in agriculture in terms of the prediction equation used by us. The figures are given in Table 2.

As regards gross domestic capital formation in public sector at 1970-71 prices for the year 1984-85, we assume a six per cent increase over 1983-84. This is based on the Central Plan investment in a nominal term as an indicator and using the wholesale price deflator. Predictors for equation (2) are given in Table 3.

Table 4 presents the estimate of gross value added in manufacturing for 1984-85 and three alternative estimates for 1985-86 based on the predictors given in Table 3.

Tables 5 and 6 put together the alternative GDP estimates at 1970-71 prices for 1984-85 and 1985-86 respectively. Table 7 presents the estimates of money supply adjusted for real GDP which are used in the equations estimated by K Krishnamurty.

## Notes

[We are grateful to Badal Mukhopadhyay, J Krishnamurthy and S K Ray for helpful discussions. Usual disclaimers apply.]

1 This gives rise to an anomalous situation where, while the taxation of once-over transfer of assets on death has been abolished, that of transfers of assets during one's own life time continues in the form of a gift tax. A possible reason for the retention of the gift tax even after the estate duty has been abolished could be that it would help prevent partitioning of wealth among the family members in order to avoid payment of tax on the wealth itself and/or on the income from wealth. However, the scope for such partitioning already exists in the continuation of the Hindu Undivided Family (HUF) as a tax-entity which has received an even better deal than the individual in this Budget—relative to the pre-Budget tax treatment. The appropriate solution to the problem of partitioning of assets as a tax-avoidance strategy is not the retention of the gift tax but a more basic change towards treating the nuclear family as the relevant tax entity. See, K Sundaram and V Pandit, 'Direct Tax Reform: Family as Tax Entity and Other Issues', *Economic and Political Weekly*, Vol XIV, No 17, April 28, 1979.

Of course the basic issue of appropriateness or otherwise of the abolition of estate duty still remains. One cannot be blind to the rigidities and avoidable hardships caused by the existing estate duty. Equally, it is not merely a question of how much revenue it generates and one cannot ignore the basic justification for estate duty, namely, that it serves as an instrument for promotion of inter-generational equity. Balance of consideration would appear to favour a rationalisation—in terms of evaluation criteria, exemption limits and the rate structure—rather than an outright abolition of estate duty.

2 Neither the "Economic Survey 1984-85" nor the "Report on Currency and Finance 1983-84" hazard any guess about the gross domestic savings rate for 1984-85.

3 If and to the extent the capacity expansion in these consumer durables was not part of the total plan in the Approach to the Seventh Plan, the investible resources left for the public sector plan would be lower even if the resources visualised in the approach document are forthcoming.

5 Apart from the disincentive effects of high taxes, the Finance Minister has viewed the delays and rigidities in the system of direct controls as an important constraint on the growth process. The first steps in this regard include: (i) de-licensing of certain industries; (ii) raising the asset-limits of the MRTP companies; (iii) placing an expanded list of capital goods on OGL; and (IV) decentralisation of decision-making in respect of import and export licensing.

9 It may be mentioned that in quantifying the impact of the Budget on high powered or reserve money we have focused exclusively on its effects on RBI's claims on the government sector. Among the other factors impinging upon the level of high powered money, we are ignoring the trend rise in RBI's claims on the commercial sector and the government's currency liabilities, both of which contribute positively to high powered or reserve money. As regards the net foreign exchange assets, it is no doubt true that drawing down of RBI's foreign exchange assets would tend to lower the level of high powered money. There is however no reference in the Budget to any major plans for drawing down the foreign exchange reserves. Similarly, the net non-monetary liabilities of the RBI, which enters with a negative sign in the identity defining high powered money, has tended to fluctuate. Our estimates of the impact of the Budget on high powered or reserve money is thus best treated as a *ceteris paribus* impact. However, our overall judgment would still be that the order of increase in high powered money indicated below indeed take place though one cannot precisely predict the way the other elements determining the level of high powered or reserve money would behave during the fiscal year 1985-86.

10 See the report in the *Financial Express*, March 27, 1985.

11 This estimate is made up of the following:

| | Rs crore |
|---|---|
| Budget deficit as presented in the Budget | : 3,348 |
| Share of 'RBI's' Own Account purchase of dated securities in proposed market borrowings | : 1,122 |
| Short-fall in 'ARM' proposed in railway Budget due to cost push effect | : 50 |
| Additional deficit financing due to concessions announced in Parliament | : 100 |
| | 4,620 |

12 See S B Gupta "Monetary Planning for India", Oxford University Press, Delhi (1979) and K Krishnamurthy, op cit, esp, p 43.

13 Similar doubts on this and other items of revenue forecast in the Budget have been raised by Mihir Rakshit. See, M Rakshit, 'The Budget and Plan Priorities', *Economic and Political Weekly*, Vol XX, No 16, April 26, 1985, pp 707-10.

14 See, K Krishnamurthy, op cit, pp 30-36.

15 Estimated regression equations relating private disposable income and GDP, both in real terms, suggests an elasticity of nearly one. In deriving our estimate of the rate of growth of real disposable income per capita we are only making a marginal addition to the forecast rate of growth of real GDP per capita, on account of tax concessions offered in the Budget, because these concessions impinge upon only a small segment of the economy.

16 See, K Krishnamurthy, op cit, pp 39-42.

# Some Emerging Trends in China's Domestic Policy

**T Karki Hussain**

*The all-powerful policy planning central committee of the Communist Party of China has now published the guidelines under the new strategy for the urban sector aimed at decentralised planning. The Chinese leadership, it would appear from this, feels emboldened to carry forward the offensive launched initially in 1978 by revising the role of the communes, into the sensitive areas of industry, commerce, science and culture. At the same time, there may be uncertain times ahead for China. Successful experiments with material incentives and decentralisation notwithstanding, the substantive dimensions of the modernisation process may unfold yet another set of dialectics to be tackled by Deng Xiao-ping's successors.*

## I

## Introduction

EVER since the founding of the People's Republic of China in 1949, the impact of the Chinese developments in terms of curiosity as well as comments has shown no signs of diminishing. It is no exaggeration to say that China's internal political process has been ceaselessly put to scrutiny both at microscopic and telescopic levels, without match in contemporary times. There have been other post-colonial, semi-feudal societies, similarly embarked on the road to modern nation-building. However, China emerges as basically different from all others, mainly due to the totality of its approach in all matters pertaining to social change. This was amply demonstrated by successive developments during the Maoist period which, through the twin-pronged strategy of class struggle and control over productive forces, brought about radical land reforms, unleashed mass campaigns, and universalised collectivisation drives in the form of the commune. All of these policies resulted in impressive achievements in the radicalisation of a class society along egalitarian lines in an unprecedented manner. A bye-product of the initial success, however, was the propagation of the Maoist claims of having overtaken the Soviet Union in the race to reach a transition to the socialist goal. The effervescence of such claims was subsequently highlighted by an induced erosion of the commune ethos which had laid a firm foundation of industrialisation at the grassroots, underpinning China's socialist economy and by its subsequent modification by the profit motive and market mechanism, almost tantamount to acknowledging the superiority of the capitalist system of management in the economic field, thereby giving an incorrect impression of abandoning the socialist process.

Admittedly, balanced development was an integral part of Maoist conception and earlier Chinese practice. From all available evidence, however, China under the leadership of Deng Xiao-ping has begun to project a new consciousness of realism by applying a different approach to the problems confronting the country in the fourth decade of its socialist revolution. Promotion of some private enterprise on the plea that some capitalism is good, and, non-alignment with a tilt towards the United States as a leading capitalist power may appear to be nothing short of heretical from China's own ideological perspective in the immediate past. However, the fact that the world continues to be mesmerised by the audacity of the present leadership, evidently, due to China's gigantic size or, perhaps, even the mystique surrounding it until 1976, distinguishes China even from some of the other socialist countries, such as Hungary and Yugoslavia, which had chronologically speaking initiated the trend towards the mellowing of dogmatic socialism by introducing some liberal domestic and external policies much earlier than China.

Indeed, from the charismatic revolutionary Mao Ze-dong to the controversial pragmatist Deng Xiao-ping, questions about China's policies both internal and external have been universally raised and the trends in its thinking intensely debated. The most recent example was the world reaction to a *People's Daily* editorial of December 7, 1984 questioning the dogmatic all-time, all-purpose validity of Marxism.[1] This was indeed a meaningful statement which has been variously interpreted as jettisoning ideology, adapting ideology to Chinese reality, using ideology for partisan purpose and so on. Given the climate of change in China today, each interpretation may have partial validity if we accept the premise that Dengism is supposed to stand for a reconsideration of a fundamentalist attitude and the consequences flowing from an apparently mechanical application of theory by substituting the dynamics of a comparatively liberal framework based on "seeking truth from facts and making practice the sole criterion of truth". Admittedly, half a decade or so is too short a period to make predictions whether Deng will succeed in realising the major objectives of his policies over a long term period even after he has physically disappeared from the scene. In other words, whether or not the successor to Deng would possibly stall or reverse the trends already gathering momentum on the Chinese scene! However, as with Maoism after Mao or with Stalinism after Stalin, survival of Dengism without Deng, basically in the context of the political dialectic rather than the personality factor, has become an important question for outsiders as well—ideologues and practitioners, communists and non-communists alike. It may, therefore, be a timely exercise to examine some of the trends which have evolved during the past few years.

The present paper seeks to place the post-Mao changes in the perspective of the change-over of leadership to another veteran, strictly belonging to the Maoist era, yet, radically different in his methodology. The resultant change and continuity are self-evident. Deng could not repudiate the fact that Maoism served the Chinese nation extremely well upto a point. From the inherited *impasse* to the new outlook, however, the abiding legitimacy of the reforms will increasingly require a combination of responses to deal with the contradictions, which in all likelihood already exist. Let us take a fleeting look at some of the aspects of the emerging new China.

## II

## Rise of Deng Xiao-ping

The death of Mao Ze-dong was a watershed in Chinese policies. The man who immediately rose to public view was Hua Guo-feng, a fellow-Hunanese along with Mao, and, holding the position of Minister of Public Security at the time of Mao's death. He came to symbolise ultimate power through the triple sources of chairmanship of the party, premiership of the government and chairmanship of the Military Affairs Committee. In view of subsequent developments, the Hua phase can at best be described as transitional or interim, for he did not emerge as representing any specific forces of significance in the Chinese government and the party and more or less appeared to be a caretaker in an interregnum. Deng Xiao-ping, who had been discredited during the Cultural Revolution and again briefly in 1976, began his resurrection and ascent shortly after the disappearance of Mao from the scene in 1976. Following his rehabilitation less than a year after Mao's demise, he began to counter Hua's leadership and his indeterminate legacy. By the time the Third Plenum of the 11th Party Congress came into full swing, Deng Xiao-ping had built a sufficiently strong case for having his views accepted by the Central Committee. By December 1978, the Plenum had decided to subdue ideological fervour and discourage the personality cult. The principal task was defined to be reform of the agricultural sector and overall economic reconstruction. Other equally momentous decisions were taken with regard to the polity including its various institutions which had come under severe pressure due to the ideological bias of Mao who allegedly had abdicated his own authority to the so-called "Gang of Four" in his last few years. Legal processes were restored and improved, education and culture were given a new direction, and a revised constitution was introduced in 1982. Meanwhile, Hua had faded into oblivion soon after the Plenum. He was eased out from membership of the Politburo and from 1982 onwards has not been notably visible, although he continues to be a member of the Central Committee. A revival of Maoist orthodoxy alone, if revitalised, may find a niche for him, but in the immediate context, the chances look feeble indeed.

Broadly speaking, some of the following trends can be described as having emerged since December 1978, making their mark in a manner that could not be imagined at that time:

(a) The third Plenum decided to reevaluate the achievements and failures of the Cultural Revolution unleashed earlier in 1966. In retrospect, it was concluded that the phase lasting a decade and more was a national disaster. Mao's role came under close scrutiny during this reassessment and subsequently he was judged to be greatly responsible for the failures linked with the Leap Forward and the Cultural Revolution Upheaval. Nevertheless, he was simultaneously given a place in the history of the Chinese revolution in sharp contrast to the de-Stalinisation at the 20th Party Congress of the Soviet Communist Party in 1956 when Khrushchev unequivocally denounced Stalin. On December 26, 1983, the 90th birth anniversary of Mao Ze-dong was commemorated with great fanfare but the ideology of Mao Ze-dong Thought was reinterpreted and selectively quoted for public consumption. An official publication of the CCP history in 8 volumes from 1921 to 1956—the years of Mao's struggle for gaining leadership and the peak of the success—has been recently published but not made available to foreigners so far. That Mao had been further devalued could be guaged by the virtual inattentiveness shown towards his 91st anniversary.[2] *The People's Daily* which in the previous year had printed 3,000 word front-page tribute to the Great Helmsman as Mao was fondly called, wrote only a brief, one sentence report on December 26, 1984.

(b) An emphasis on four modernisations, *viz*, agriculture, industry, science and technology, and defence within a restructured framework became a curtain-raiser to a radical departure from the prevailing Maoist percepts.

(c) Agricultural reform became the backbone of the new economic strategy as applicable to 80 per cent of China's one billion population. The role of the communes was revised and the farmers were allowed to cultivate land for personal use. The production responsibility system linked income to output.

(d) Following the success of reforms in the agricultural sector in the form of visibly growing improvement in the general standards, doubling of peasant incomes by 1983 and the achievement of a record harvest estimated at 400 million tons in 1984, a new set of urban changes has been initiated to complement and further galvanise rural progress. Under a party directive issued in October 1984, vital amendments are being sought in the hitherto centralised planning, and, greater autonomy given to factory managers who now would have to perform competitively in the market and be accountable for their results, in order to prolong their survival. Government patronage of the public sector, irrespective of the latter's functioning unique price and wage policy, heavy subsidies for food, clothing and rent are being adjusted in accordance with the directive described officially as "a scientific blueprint for modernisation".

Deng Xiao-ping, who in his capacity as the General Secretary of the party, had supported Mao's peer and rival, Liu Shao-qi on some basic reforms, specifically the latter's stress on party organisation and on an economic strategy linked to material incentives right from the fifties onwards, and hence found himself clashing with Mao occasionally but still surviving till the excessive leftism of the Cultural Revolution threw him out in the cold, has found in Zhao Zi-yang and Hu Yao-bang an ideal executor and a dependable propagandist of his ideology. Both of them, currently holding the positions of the Prime Minister, and the General Secretary of the party respectively are by themselves lightweight personalities, but are seen to be competently exercising their responsibilities to make a success of Deng's new strategy. To note, Zhao Zi-yang has reaffirmed China's basic commitment to socialism while asserting simultaneously that it would be difficult to build socialism without invigorating production as "socialism which is not based on the growth of the productive forces is meaningless".[3] Hu Yao-bang deals with the superstructure and has gone on record encouraging a total reformation in the field of arts and literature and in thinking and behaviour and has even gone to the length of defending the youth taking to bourgeois ways of dressing up colourfully and smartening up appearances, including stylish hair styles. The latest statement questioning the efficacy of Marxism in solving all problems is also attributed to Hu Yao-bang during a talk with the senior cadres of the Publicity and Propaganda Department of the Communist Party.[4]

It may be assumed that the policies enunciated by Mao's successors will take China's progress further if one accpets the premise that a greater reliance on market forces is necessarily good even in pure economic terms. Whether it will result in a quantum leap will essentially depend on a combination of fortuitous circumstances, including internal political stability and the external circumstances. To some extent, the latter, obviously, will be a direct consequence of China's accessibility as a market and as a producer *vis-a-vis* the outside world with which it has only recently forged links. As Mao said, if you want to know the taste of a pear, you must do so by eating it yourself. Deng while opposing Mao's idea of permanent upheavals went even further when he said that the colour of the cat was immaterial—the important thing was that it caught rats.[5] The emphasis on professional, scientific, technological upgrading as an essential element in modernisation is not considered as an end in itself but as a means of making available the fruits of progress for all. The mechanics of change include evaluation of party ideology, army politics, bureaucratic culture and personality cult, etc.

## III

## The Process in Evolution

The trends within society delineates the much subdued presence of the PLA and ideological interference of the kind the country was experiencing in cycles through the early fifties to mid-seventies. This does not mean, however, that political guidelines would be neglected or that the party would lose its monolithic omnipotence. Under the one party system that

China practises, it would be absurd to imagine that the levers of control would be relinquished by Deng Xiao-ping and his trustworthy team. Evidently, pragmatism makes allowance for flexible revisionism, where party politics is concerned. Any anti-party activity in the form of opposition to Deng Xiao-ping's pragmatic policies, by the far from extinct Maoists, tends to be thoroughly uprooted and discredited. Although Deng Xiao-ping has succeeded in overhauling the composition of the Central Committee and its Politburo as well as the Standing Committee of the National People's Congress by filling up places with like-minded party members, thereby creating an apparent harmonious relationship at the top, the same cannot be said about the middle and the lower ranks further down the hierarchy. And these are precisely the elements whom it would be difficult to dislodge.

Since last October, a three-year rectification campaign has been let on in order to purge or re-educate a vast majority of members, estimated at around 20 million, who joined the Communist Party during the Cultural Revolution period. So far, according to estimates, barely a million have been affected, which is akin to being merely the tip of the iceberg, because the number slated for expulsion was four million. A strong belief goes that the leftists whom Deng Xiao-ping wanted to oust but could not succeed in doing so have managed to moderate the scope of the purge which if unleashed in an uncompromising spirit would have produced an unsettling impact for which the country was ill-prepared. Eventually, however, loyalty to Maoism is not expected to remain immutable due to changing attitudes and weakening of old allegiances.

Paradoxically, the party's weakness is also its strength. Its membership, its training and discipline, its responsibility and its sense of unchallenged power should be kept in mind as the cadre forms the most important link not only between the command (leadership) and follow-up (people) elements but also remains a basic monitor overseeing the actual working of the social process along the given tract. Rectification movements in motion underscore the universal truth that they are simultaneously a product of the system and a condition for its survival. At the same time, they are suggestive of the urgent need of reorienting the consciousness of the cadre which during the Maoist era had been nurtured on the utopian, romantic and at times even adventurist ideas of permanent revolution and has to come to terms with new realities and new objectives. In the ultimate analysis, the cadre's own social understanding, the level and the extent of intellectual qualifications and commitments are pre-requisite for transmission of ideas to the people, working in the fields or factories and equally importantly, making the policies work. This is being done through a process of re-education as well as induction of new members, notably intellectuals, who had largely borne an enormous burden of class prejudice during Mao's life time.[5]

As is well known, the People's Liberation Army has always retained a special place in the history of the communist movement and the subsequent implementation of socialist policies throughout the country. To elucidate, during the period of the revolutionary struggle, the PLA also performed productive and ideological functions, apart from its professional fighting role. During the ascendency of the ambitious Defence Minister, Lin Biao, who was constitutionally nominated as successor to Mao in 1969, the PLA's political and ideological functions overshadowed its professional activities. During the turbulent years of the Cultural Revolution period, especially between 1966-68, when the civilian authorities failed to curb violence and disorder and the grip of the party was loosened due to factional infighting, the PLA stepped into the vacuum and began to exercise effective power in the management of the country. Subsequently, however, the party recouped its vitality and soon after the exit of the interim leader Hua Guo-feng, it became evident that the PLA would also fall within the proposed reform structure which aimed at reducing ideological, political interventions to the minimum and to professionalise the hitherto active neo-politicians in the army ranks.

Admittedly, the task of forcing the army back into the barraks is not easy, following its high profile throughout the Cultural Revolution period and its aftermath. However, the desire for professionalism as part of the modernisation package calls for an acceptance of the Dengist dictat. Perhaps, its indifferent performance during the brief war in early 1979 against Vietnam has created a favourable mental conditioning to undergo training, upgrade its expertise and generally improve its image. At the same time, depoliticisation of the country's 4.2 million strong military has remained an uncertain element in present Chinese developments. A sequel to the controversial December 7 editorial regarding Marxist inadequacies to deliver the goods was a PLA editorial in its restricted *Liberation Daily* in the ensuing week, stressing the need for party discipline amid the flexible reforms intended to motivate economic performance. According to the editorial, party unity was all important and therefore "flexibility cannot be applied to the party". Conversely, the above response could be meant as a calculated alert against impetuous proclamation of limitations of ideology without recognising its more stable features.

The opening out of the Chinese economy towards the world is being pursued through four windows—technology, skills, foreign investment and working with foreigners within China. In a guarded, experimental manner, the authorities are confining the process to four Special Economic Zones with a discernible increase in the degree of openness, which have received topmost attention in terms of infrastructural facilities being provided by the Chinese government in the absence of which the very objective of the zones would be null and void. For example, in the Shenzhen Free Trade Zone, situated to the north Hong Kong, in a span of four years, a veritable metamorphosis has occurred, radically altering the dreary bleak face of the small border town into a bustling, industrial township. Most of the land has been reclaimed and transport, communications, water, power, harbour, factories, residential quarters, public utilities, department stores, restaurants, and shops have been provided. More than 100 industrial units have been established, thirty of which have gone into production. Similarly, in response to the new economic policy, foreign investment has started coming into the country, which, while Mao-led specially in the wake of a rift with the Soviet Union, had stressed self-reliance in building and enlarging its industrial base. By the end of 1983, investment from outside worth US $14.6 billion notably from Japan, US, Western Europe, Hong Kong, etc, had been used to finance a number of joint ventures and co-operative projects. Some of the foreign investors have set up wholly foreign-owned companies.

The Chinese themselves are at pains to explain the changes in the economic strategy by describing the opening through the four windows as links with the industrially advanced countries in the special zones while simultaneously providing leaks in the form of advanced technical know-how to the country. At this initial stage of interaction, they are quite confident that in a measured way, the leaks will be generated into the rest of the country although in themselves the SEZ are a mere drop in the ocean of the Chinese economy. On the surface, it appears to be a sensible concept of providing the right mix of protectionism and competitiveness by allowing a certain percentage of the manufactured items into the Chinese domestic market and agreeing for the rest to be marketed by the operating multinationals and other partners. Evidently, there is intense competition for access to the Chinese market. However, the Chinese themselves have entered aggressively the competitive field of foreign trade in a big way, both in terms of diversification and quality. Available statistics for China's exports reveal the trends in its growing links with the outside world. Six years ago, China was placed 32nd in the international export field. By the year 1984, it had claimed to the 16th place. In the past, agricultural products used to account for more than 90 per cent of its exports. Currently, however, they form only 16 per cent of the same, the rest being machinery (43 per cent) and textiles, manufactured items and oil (41 per cent).

An essential component of the onward march of the modernisation drive is the continuity of its open door policy and expansion of economic and technical exchanges *vis-a-vis* the outside world. Hence the decision to enlarge the experiment further by opening up 14 more coastal cities and the Hainan island to the joint venture co-operative production process, which has as its core strategy absorption of foreign capital and import of advanced technology. That the liberalisation has paid dividends to some extent is beyond doubt. The Chinese are sure that there is no looking back, or with one step ahead, taking one step backward. In order to woo the wary foreign investors, the Chinese leaders have made explicit reassurances and asked them to be bolder in their dealings. At a three-day symposium held in Beijing in October 1984 on economic co-operation with the outside world, both Zhao Zi-yang and Deng Xiao-ping pledged that China's policy of opening to the outside world was long-term and immutable. They went on to add that changes would be made in the direction of further enlarging the opening. Other important leaders such as Gu Mu and Hu Qi Li, members of the State Council and of the Central Committee of the CPC respectively, mentioned the size of the internal market. According to them, in future ventures involving foreign investment and advanced technology would be allowed to sell part of their high-quality products in the Chinese market.[7] The leadership exudes confidence and is hopeful of progress in economic construction, expansion of purchasing power of the people, steady growth of the market demand of one billion consumers and consolidation of economic and technical exchanges with the rest of the world. The query whether the developments will prove the assertion to be realistic or inflated would remain in the realm of possibilities either way, looked at from the outside but the Chinese characteristically express no doubts that nothing succeeds like success. At this point of "boom", at least overtly they have refrained from worrying about excess or moving too fast.

While one could not be faulted for nursing some skepticism about the durability of the policies, of opening towards the world and internal liberalisation, intrinsically linked to the socio-economic areas without political liberalism, or feel that it could be a temporary phenomenon, an expedient device on the part of a successor regime, which finds it tactically necessary to note the failings of its predecessors, and discredit them, one perforce has to take note of the fact that the audacity of Deng Xiao-ping continues unabated and his reform has retained its momentum and innovativeness. Within less than six years, chronologically counting from the 3rd Plenum of the 11th Central Committee in December 1978 to the 3rd Plenum of the 12th Central Committee in October 1984, vital changes have been introduced in the countryside by revising the role of the commune and providing a responsibility system to the farmers, and, a major economic reform aiming at decentralisation in the urban sector is currently on cards. And backing Deng's heretic ideas, when compared to the Maoist legacy especially of the period of the Gang of Four's ascendancy, is the objective situation within the country on all fronts and broader support of the people.

When Mao passed away, the scale of problems confronting China was formidable indeed and priority areas were a legion. One must hasten to add, however, that a fair assessment of socialist development in China from 1949 to 1966 would render due homage to the political will exercised by Mao to push his country forward almost with Herculean efforts. For various reasons, however, the results did not conform to expectations. Understandably, the setbacks of the Cultural Revolution have clouded many a judgment. For our purpose, it would be sufficient to mention on the basis of the subsequent Chinese revelations that the situation inherited by Mao's successors was agricultural sluggishness, industrial inefficiency, growing restiveness of the larger segments of people due to a shortage of goods and services, etc. Professionals, including scientists and academics, also were severely frustrated due to closed outlets for advancement and career promotion. Only a fundamental overhaul including the motivational springs of the system could extricate the nation from the drudgery of a regimented milieu and its subsistence level economy which did occur at the behest of Deng Xiao-ping. The latter while lacking Mao's intrinsic charisma has displayed a unique singlemindedness for orienting social change through the introduction of some principles of capitalist economic management which in itself has resulted in a dramatic break from the Soviet and Maoist models which had continued to spawn over-centralisation, bureaucratisation, inefficiency and stagnation. Explicitly, a consensus manipulated by the present leadership had been projected nation-wide that rather than fight capitalism and capitalist adversaries, China could change its destiny if it could successfully graft a capitalist plant to the socialist tree. The recently concluded Sino-British agreement on Hong Kong under which the Chinese government has consented to retain intact the present ways and value system of the British-governed colony even half a century after the lease for the New Territories lapses in 1997, underlines the quinessential adjustment under the circumstances—aptly titled one nation-two systems. In other words, China has embarked tentatively on a limited liberal venture for realising socialist objectives in an authoritarian political system, the strength of which lies in the fact that it absorbs its conflicts; its weakness is that it may aggravate their number. In one sense the above experiment is a contradiction in terms.

## IV

## Problems and Prospects

It is a truism that internal political stability to a large extent is dependent on economic growth. The entire thrust of Deng's offensive against Maoist orthodoxy was premised on constant, consistent economic growth and benefits to the masses in a visible manner. On that ground, it should be admitted that constant growth at a fairly good pace has taken place. It is to be seen, however, whether the momentum can be sustained. A major source of the rate of growth is the productivity of agriculture in a country with 80 per cent of its population living in the country-side. From various estimates, apparently the plateau has already been reached. Largely, growth has been the result of using existing structures to the maximum and motivating individual initiative. However, increase in production through structural changes has paid dividends. Now that consumerism is being encouraged, it is quite possible that lesser capital accumulation and lesser investments could come in the way of faster growth.

However, as one sees the rapidly changing scene it transpires that:

(a) Peasants have become prosperous and have savings to invest which means that they are capable of accelerating production.

(b) With China shedding off its self-imposed isolation, foreign investments have come into the country in an unprecedented manner and the results are self-evident in certain image-building industries such as tourism, construction, steel, oil, etc.

(c) Off-shore oil investments will both strengthen China internally in terms of self-sufficiency in its energy needs and underwrite financing of its ambitious modernisation programme.

On the other hand, some nagging questions remain. For instance, can the peasant overnight turn into an entrepreneur? Can capital accumulation continue at the pace required by the modernisation drive, for initially does it not often happen that consumerism cuts into savings? The craving for the material trinity of a refrigerator, a colour TV and a washing machine has almost become the opium of the *nouveau riche* in Chinese society. Further, have foreign investments come to the extent the Chinese hoped for? It is too early to surmise in the affirmative for obviously the much talked about Sino-Japanese economic co-operation or the Sino-US agreements still answers a small portion of China's need for foreign investment. According to official statistics, upto now China has attracted about US $8 billion in direct investments, which actually forms an infinitesimal part of the national economy. Six years after the switch-over from a policy of self-reliance to one of seeking foreign investment, uncertainties over taxation, labour, marketing and other problems have acted as major constraints in the flow of investments into China. Deng Xiao-ping has been recently quoted as saying that the socialist economy of China will not be shaken by foreign investment even if the latter snowballs to reach 100 billion Yuan, approximately, i e, 40 billion US dollars at the current rate of exchange. Presumably the figure describes wishful thinking on the part of China's ageing leader in a hurry to modernise his country with generous input of investments from the Western countries. Here, it may be relevant to point out that China itself has built capital assets worth several hundred billion dollars.[8] Yet despite huge reserves, it is continuously trying to raise long-term, low-cost capital from abroad to finance its ambitious modernisation programme.

Other doubts concern the dichotomy between the political process which remains authoritarian and the economic objectives which can be tentatively described as largely materialistic. Thus, individual initiative could quite often be throttled by the procedural intricacies of the system. Similarly, the economic autonomy does not exactly match with the centralised authority currently in command which despite pronouncements of decentralisation has inevitably been slow in dismantling. In short, can one dissociate economic organisation from the political structure? The brief Beijing spring, known otherwise as the Democracy Movement could be a portent of future developments. The campaign of spiritual pollution directed against the moderates, continued violation of human rights by the state machinery, capital penalty, etc, only reinforce the argument.

As in the agricultural sector, reforms have been introduced in the urban, industrial sector. The purpose is to modernise the industries within the framework of a technical-managerial revolution. In other words, competence and efficient managment are the by-words of the present industrial reform. The process is fraught with uncertainties, for the attempted reform strikes at the very root of the superstructure inherited from Mao Zedong, specifically the mystique of egalitarianism summed up in the Chinese expression *Da Guo Bao*—eating from the same pot. Naturally, the twin-fold revival of kulakism and careerism rankles as much as the spectre of unavoidable contradictions between the technocrat-manager and the work force, between the party cadre and the people, between the rich and the backward areas and between the coastal and the hinterland China lurks menacingly in the background. The list is unending. Finally, one basic question remains to be answered convincingly—has economic decentralisation been effectively implemented? If the exercise is ambivalent, the benefits of economic reforms cannot be optimised. And since desired results are being sought against tight deadlines and awe-inspiring claims—typical traits of Chinese leadership which came to the fore during the rushed phase of communising the entire country and the grandiose claims of having reached the stage of communism before the Soviet Union by proclaiming the success of the Great Leap Forward and the communes—it may be prudent to keep in mind that all economic changes have to work against a lot of inertia and handicaps of the past, along with some basic impediments to fast growth in certain parts of China, specifically those of its regions in the north, west and the south-west which offer a sharp contrast in development to the "golden coastline" including the present expanding "capitalist zones" which traditionally have remained in the fore-front of commercial and trading links with the world at large. Therein, regional disparities have a direct relevance to the clarion call of modernisation of agriculture and diversification through opening up hitherto repressed areas of sideline activity. For, in the ultimate analysis, side-line activities generally go in tandem with agricultural affluence and apparently in impoverished areas, poor income would continue to be the norm rather than an exception in the immediate period.

To reiterate, it may be appropriate to consider certain factors for the purpose of evaluating the performance score of the modernisation drive. Importantly, who indeed has benefited most from the reform? Do the peasantry and the industry have sufficient surplus for parallel capital construction and conversion into earnings in foreign markets? How does one foresee the effect of Special Economic Zones on the insular, backward hinterland ethos? How much would China expect to receive and absorb in terms of technology and credits from the west?

It would appear that in most cases the *avant garde* elements who have traditionally wielded both political and administrative power at the grassroots and elsewhere have emerged as the leading figures in individual initiative. Admittedly, China has taken impressive strides in modernising the infrastructure and establishing its credibility as an up and coming sophisticated economy in being. However, it cannot be ignored that the construction boom notably is at the cost of two other vital areas, *viz*, energy and transportation. Heavy industry continues to show growth against a targeted decline in favour of light industry. Further, the Special Zones would continue for quite some time in the foreseeable future to be exclusive and even exclude the interior which remains parochial and depressed and hence distant from the rags to riches objective. Finally, the benign attentiveness of the west, specifically the United States, would have as much longevity as China's opposition to the Soviet Union.

The above perspective is, indeed, basic to our understanding of the forces currently at work, not necessarily at cross purposes with each other. And now that the all powerful policy planning Central Committee of the Communist Party has finalised and published the guidelines of the new strategy in the urban sector in the 6-day Plenum held in October 1984, aiming at decentralised planning, it may be assumed that the leadership is emboldened to carry the offensive launched under the directive of Deng Xiao-ping, initially in 1978, by revising the role of the communes further into the sensitive areas of industry, commerce, science and culture, mainly because it has achieved some remarkable success in overriding the stalemate and aberrations of the Maoist era. At the same time, there may be uncertain times ahead about the smooth transition to the 21st century ethos. For, China has speedily carried out the easier part of the post-Mao structural reform and related economic strategy, relying on the tide of enthusiasm aroused by the initial responses. Successful experiments with incentives and decentralisation notwithstanding, the substantive dimensions of the modernisation process reoriented under the directive of 80-year old Deng Xiao-ping may unfold yet another set of dialectics to be tackled by his successors.

## Notes

1 Entitled "Theory and Practice", the theme of the *People's Daily* editorial dealt with the Marxist nature of the Chinese state and the fact that China was pursuing Marxist principles in accordance with Chinese realities. Mao Ze-dong had won the revolutionary struggle on the basis of the strategy of integrating theory with pratice. Later, however, errors were made due to deviations from the above principle. The editorial significantly noted that Marx, who died more than a hundred years ago, could not be accepted without reservation or qualification. In the words of the commentator, "Marx has been dead for more than 100 years . . . some of his assumptions were based on conditions of that time. Great changes have taken place and some of these assumptions are not appropriate today . . . We cannot expect the writings of Marx and Lenin written in their time to solve our present problems". The editorial subsequently drew attention mainly due to the fact that it had consciously viewed Marxist idoelogy as outdated and, therefore, not entirely relevant to Chinese conditions. Interestingly, the very next day, the *People's Daily* carried a correction, adding a single word "all" to a sentence in the editorial to make it read: "we cannot expect the writings of Marx and Lenin to solve all our problems". The omission of the word "all" was explained as an editorial oversight. See the text in *Ta Kung Pao* (weekly supplement), December 13-19, 1984.

2 However, the occasion of the 90th anniversary was also used as an opportunity to further downgrade Mao's status by converting his mausoleum into a memorial hall for other revolutionary heroes as well. In keeping with the spirit of de-Maoisation or the fact that Mao was no longer considered the sole high priest, the direction and the objective of the Chinese revolution, the selected works of Deng Xiao-ping, Liu Shaoqi, Zhou Enlai and Chen Yun have made their appearance in the last few years. The latest publication released at the end of 1984, however, is a 72 page long collection of 22 speeches made by Deng Xiao-ping during 1982 and 1984, entitled "Building Socialism with Chinese Characteristics". The collection evidently seeks to reinforce the correctness of Deng's initiatives, specifically his re-interpretation of the ideological legacy of Marxist-Leninist Mao Ze-dong Thought, namely, that socialism will remain China's ideology despite the adoption of "some capitalism" to advance socialism.

3 Presumably, it was no coincidence that the Chinese premier's remarks were made on December 14, 1984, precisely a week after the *People's Daily* editorialised the provocative caution about dogmatic application of Marxist theory and the inefficacy of that ideology to resolve all the problems confronting the country.

4 See *Hong Kong Standard*, January 5, 1985.

5 Deng's famous statement as to what difference does it make if the cat's colour is black or white so long as it catches mice was actually made more than two decades ago.

6 One may recall that Chinese intellectuals and artists suffered the backlash of the abortive liberalisation launched by Mao in 1957 encouraging frank and candid expression on all subjects, including the role of the party, under the slogan of "let a hundred flowers bloom, let a hundred schools of thought contend". The weeding out in the form of an anti-rightist purge began a bare five weeks later and pushed the anti-party critics into disgrace and oblivion. Ever since then, the intellectuals remained as political targets of censure and mistrust by the leadership at all levels, the most virulent manifestation of which was made during the Cultural Revolution and its aftermath, when some of the country's eminent litterateurs and scholars were persecuted to the point of suicide, death due to want and repression or were exiled to the countryside to work on the farms. The current rehabilitation of the intellectuals, including the promise of "literary freedom", vividly demonstrated during a Chinese Writers' Conference in the first week of January 1985, however, should be evaluated with reference to the on-going rectification campaign directed against ultra-leftist ideology which remains a stubborn legacy of Mao Ze-dong's later years of stewardship of the nation, encompassing the Leap Forward, the Communes and the Cultural Revolution. The rectification, however, remains a twin-edged sword and could be easily directed against those who dare to transgress approved limits. Persecution of intellectuals again briefly flared up as recently as October 1983. There is nothing unfamiliar in the latest party dictum exhorting, as it does, the writers "to study and creatively apply the basic principles of Marxism and in particular apply the viewpoint of dialectical and historical materialism"

7 *China Trader Weekly Bulletin*, October 13, 1984.

8 According to official Chinese sources, China's foreign exchange reserves soared to US $ 16.48 billion by the end of June, 1984, compared with US $ 2 billion at the end of 1980. Earlier, excessive purchases in 1978 and 1979 had made a large dent in the reserves.

---

## Dena Bank

**DENA BANK registered an impressive performance during 1984. It opened 43 new branches taking the total network of offices to 972. Total deposits of the Bank went up from Rs 1,256 crore in 1983 to Rs 1,460 crore as at the end of December 1984, recording a growth rate of 16.2 per cent. There was considerable pick-up in bank credit with advances increasing from Rs 722 crore to Rs 893 crore. The Bank earned a net profit of over Rs 81 lakh, despite substantial payments of additional wages and allowances to staff. The level of outstanding credit to the priority sectors registered a rise of 25 per cent, from Rs 282.52 crore to Rs 353.57 crore. With this, the share of priority sectors in the Bank's net advances rose to 41.1 per cent, thus exceeding the stipulated target of 40 per cent expected to be achieved by March 1985. The level of oustanding credit to the agricultural sector increased by over Rs 20 crore to Rs 99.41 crore and advances to the small scale sector recorded a growth of Rs 27 crore to Rs 161.60 crore in 1984. Reflecting the growth in outstandings, the number of borrowal accounts under priority sectors has gone up from 2.76 lakh to 3.28 lakh.**

**The level of outstanding advances under the New 20-Point Programme increased from Rs 87 crore in 1983 to Rs 116 crore in 1984. The aggregate disbursements under the Integrated Rural Development Programme (IRDP) reached Rs 28.16 crore covering 1.16 lakh beneficiary families. A Computer Cell has been set up at the Head Office. The Bank will shortly launch MICR Cheques for clearing operations in the four metropolitan cities of Bombay, Delhi, Calcutta and Madras. With a view to further diversifying its activities and widening the range of services to customers, the Bank has set up a separate Merchant Banking Division at the Head Office.**

# Bashing Nutritionists: The 'Small but Healthy?' Hypothesis

### Sol Chafkin

DAVID SECKLER's somewhat testy presentation of his hypothesis (*EPW*, November 3, 1984) shows unmistakable signs of "what we don't know (whether functional impairments result from chronic less-than-severe EPM, energy-protein malnutrition), won't hurt us". Acting on his hypothesis and adopting his proposed nutrition policy entail some risks and call for judgments that he has not explicitly acknowledged.

Seckler's views, as I read them, seem to include the following:

(1) Many nutrition scientists/advocates are muddleheaded. They confuse different kinds of EPM. Seckler clarifies things by using terms like 'pure chronic EPM' and 'mild acute EPM'!.

(2) Millions of people who fall below certain height, weight and related standards are considered to be suffering from some degree of EPM. But most of these people, although small in size, seem to function adequately.

(3) It has not been demonstrated that these 'small' people are functionally impaired in any of the physical, mental, or emotional dimensions of life. Therefore, they should be considered 'healthy'. (See how strong the short Nepalese are!)

(4) This 'Small but Healthy' (SBH) hypothesis must be considered valid unless and until irrefutable evidence of functional impairment is produced.

(5) If SBH is valid, then we need worry only about acute EPM, probably representing less than 10 per cent of the total EPM population.

(6) Therefore, says Seckler, the only commonsense policy is to give highest priority, in the use of nutrition improvement resources, to preventing acute EPM. Treat the acute EPM cases (known to represent functional impairments) before treating cases where adverse health effects, if any, are unknown, i e, chronic but less-than-acute EPM. What could be more obvious?

There are a few murky aspects of Seckler's generally brilliant exposition of his hypothesis and his policy prescription. He implies he knows (but does not tell us) what symptoms of what physical, mental and emotional impairments to look for. He sees no symptoms among the chronic EPM. If, by a stroke of luck, an impairment among the chronic EPM should be found, Seckler must be shown proof that the impairment was caused by EPM and by nothing else. Would functional impairments associated, for example, with Vitamin A deficiencies, anemias, and diarrhoeas be ineligible impairments because these conditions are somehow seen as independent of pure chronic EPM?

The prospect of shrinking the world's malnutrition problem to 10 per cent is more exhilarating than seeking the spectrum (or the thresholds) of severity of particular impairments, if any, that might be associated with different degrees of EPM. Still, Seckler acknowledges something of a spectrum in noting that there may be *mild* cases of *acute* EPM. I suppose, then, that there may also be *severe* cases of *chronic* EPM. So the overlap area of risk gets wider than 10 per cent and the distinctions fuzzier, especially in each of what Seckler calls the physical, mental, and emotional dimensions of life. Could it be possible, for example, that a risk of mental impairments of SBH folks exists not only in acute EPM but also in the *severe* case of *chronic* EPM, or that a risk of emotional impairment may exist in *moderate* cases of *chronic* EPM? Nobody knows, but some investigators have accepted the importance of looking and have begun. The complexity of the subject makes Seckler's hypothesis almost refutation-proof for the foreseeable future.

Some foreign construction companies under contract on major earthmoving projects in some poor countries have concluded that it is cost effective to set up feeding facilities for the labourers. Without feeding, work capacity is four hours a day. The contractor needs seven hours of work to meet contract targets. Do we have impaired work capacity among SBH chronic EPM or did we unreasonably change the prevailing expectations or standards of adequate functioning?

Seckler explains that tallness is one sign of affluence and that affluence is a good thing. I suppose, then, that shortness or smallness may be one sign of poverty and that poverty is a bad thing. The chances seem reasonable that many, if not most, SBH people may also be Small but Unhappy (SBU), because poverty is a bad thing and they are in it. If there are a fair number of SBH people who are also SBU, then chronic unhappiness may be an emotional impairment caused by chronic anemia-induced fatigue that in turn is caused by being chronically malnourished, and aggravated by chronic worry about obtaining food for self and child. Is this possibility ruled out because we don't know much about the emotional dimension of life, proof is hard to come by, and anyway, you can't prove EPM caused it?

The convenient feature of Seckler's proposed policy of giving high priority to preventing and treating acute EPM is that the cases are relatively few. While he does not spell out what specifically would be done, Seckler must mean feeding and otherwise restoring to health (at the chronic EPM level only?) individuals, especially children now suffering from acute EPM and continuing preventive intervention to avoid relapses below chronic EPM. The idea is to assure everybody of at least a state of chronic EPM.

In this connection, some investigators believe that acute EPM in children may be mainly the result of what may be called 'impaired families'. These can include chronic EPM households where, for example, the mother has been abandoned, is bereft of family support, too young to cope, sick, poor, mentally disturbed, drunk, fearful in seeking help, unemployed and unemployable, and in other ways unable to function as a child care provider. These impaired families are known to villagers or urban neighbours and therefore easily identifiable. In these circumstances, it seems evident that nutrition resources cannot be effective without a much more extensive range of services (health, jobs, housing, literacy, psychosocial therapy, etc) to rehabilitate the parent(s) or to provide a substitute parent. Indeed, what is needed goes beyond government services (notoriously ineffective in reaching the poorest or improving their lot) and requires creating a caring environment that demands human resources more scarce and costly than nutritional resources. So, it is not at all obvious that the Seckler policy is of significance in coping with this tangled web of poverty and pathology.

For the moment, Seckler's position smacks very much of "if it [impairment] hasn't been proven, then it has been disproven". This is not necessarily a commonsense basis for choosing a policy of preventing and treating acute EPM. Impairments among SBH have neither been proven nor disproven. Therefore, the Seckler policy, by withholding nutrition resources, accepts a possible risk of impairments among moderately malnourished people. On the other hand, a decision to devote nutrition resources to moderately malnourished people accepts the risk of wasting nutrition resources. Some societies may prefer (and be able to afford) the risk of waste. Others will welcome the absolution (and the lower costs of much smaller programmes and subsidies) conferred by the SBH hypothesis and its resultant policy.

In situations of uncertainty, there is nothing more practical than a good theory and Seckler has offered one. Until research methods can determine conclusively whether functional impairments are caused by less-than-acute malnourishment, the SBH hypothesis will—and should—influence policy. The only competing and probably more popular hypothesis is much older, namely that all malnutrition is deleterious to human development, that appropriate national and international action can eliminate chronic malnutrition everywhere, and that such action should not depend on evidence of identifiable functional impairments caused by such malnutrition. Each hypothesis creates its own special discomfort on knowledge gaps and resources gaps. So, it is good that Seckler is making nutritionists, government, and others choose.

# GUJARAT

GUJARAT NARMADA-The world's largest single stream Ammonia-Urea plant is also

the country's most unique Fertilizer plant

It has dramatically changed the industrial skyline in Gujarat. Promoted by the Government of Gujarat and Gujarat State Fertilizers Company, Gujarat Narmada, with its 4.60 lakh shareholders, is Asia's largest company in respect of public shareholding. 1.30 lakh investors are farmers and their co-operatives.

World renowned experts: Linde of West Germany, Texaco of USA, Haldor Topsoe of Denmark, BASF of West Germany and Snamprogetti of Italy have participated in its making: Based on a zero pollution concept, its electrostatic precipitators eliminate fly ash discharge, and a high stack of 125 metres, $1\frac{1}{3}$ times taller than Qutab Minar, ensures highest dispersion factor of pollutants, if any.

Going on stream in December, 1981 and into commercial production in July, 1982, the plant has a massive production capacity of 1350 tonnes of Ammonia and 1800 tonnes of Urea per day. This goes to the farm sector in Gujarat, Rajasthan, Madhya Pradesh, Punjab, Haryana and Uttar Pradesh. It helps in increasing food grain production by 28 lakh tonnes with an added income of Rs. 35 crores to the farmers.

Gujarat Narmada is already marketing its by product Liquid Nitrogen, Pure Sulphur recovered in its pollution control process, and surplus Ammonia, to industrial users. This results in a large saving of foreign exchange.

Gujarat Narmada plans ahead of today's needs, and many more projects are on the anvil.

Gujarat Narmada—a growth nucleus for the country.

**and many other items.**

GSFC – pioneers and leaders in the manufacture of Gujlon-Nylon-6, have successfully developed a three layer packaging film through co-extrusion of Gujlon (nylon-6) and Ionomer for the first time in India. Making a significant contribution to the field of packaging

The three layer co extruded film, widely used in developed countries for packing of edible oils, motor oils, food stuffs such as fish, chicken, etc. and spices, offer many unique properties such as impact strength, transparency, excellent barrier properties to moisture, odour and vapour, flexibility in handling, good printability and sealability as well as a very good abrasion resistance

Processors of edible oils, vanaspati, motor oils, food stuffs, spices and other items will benefit from the reduced cost of packaging, increased sales, ease of marketing and distribution and sophistication in packaging Consumers will have the benefit of safety from pilferage and adulteration, freedom from rust and pollution and retention of freshness and flavour of the product for a longer time as against the conventional packings

GSFC – pioneers in the manufacture of fertilizers, petrochemicals, industrial gases and plastics now offer a unique opportunity for big strides in the field of packaging by developing and making available special grades of Gujlon for coextruded film

# Agriculture, Landholding and Agro Industries in Gujarat

## A Profile

**T D Soyantar, IAS**

*Managing Director, GAIC Ltd*

THE total geographical area of Gujarat is 195.98 lakh hectares constituting about 6 per cent of the total geographical area of India. The area under forest is about 10.44 per cent of the total geographical area, the area under cultural waste land is about 10.55 per cent, the area of culturable fallow land is about 4.63 per cent, whereas the area under cultivation is 50.88 per cent and the rest is uncultivable or not available for cultivation. The total area under cultivation for the entire nation is about 53 per cent of the total geographical area which compares well with 50.88 per cent of the total area covered under cultivation of Gujarat. The area under irrigation is only 18 per cent of the total area covered under cultivation. As against this the percentage of the area under irrigation for the entire nation is 26.6 per cent of total area under cultivation.

Out of the total area under cultivation in Gujarat, i e, about 99.71 lakh hectares, about 47.43 lakh hectares area is taken up for cultivation of foodgrains (about 48 per cent of total area under cultivation), about 26.88 lakh hectares area is used for oilseed cultivation (about 27 per cent) whereas the balance land is under the cultivation of cash crops like sugarcane, cotton, and tobacco.

Cereal cultivation is concentrated in districts like Banaskantha, Mehsana, Panchmahals, Kheda and Kutch. Major districts giving pulses are Kutch, Surat, Panchmahals, Banaskantha, Bharuch and Baroda. The concentration of oil seeds can be observed in Banaskantha, Mehsana, Amreli, Bhavnagar, Jamnagar, Junagadh, Kutch and Rajkot districts.

Concentration of tobacco cultivation is confined to Kheda and Baroda. Cotton cultivation is confined to Ahmedabad, Baroda, Bharuch, Sabarkantha, Rajkot and Surendranagar. Concentration of sugarcane cultivation can be observed in Surat, Rajkot, Junagadh and Valsad districts.

In 1970-71 about 35 per cent of the total area in the state was distributed among 75 per cent of the landholdings, the size of landholding being less than 5 hectares whereas about 25 per cent of the large and medium farmers were having access to about 65 per cent of the total landholdings, the size of landholding being more than 5 hectares. Over a period of time, i e, in about a decade, the total size of landholding in plots of less than 5 hectares increased to 43 per cent of the total area, being distributed among 78 per cent of landholdings, whereas 22 per cent of the landholdings had access to about 57 per cent of the total area.

The area cultivated by an individual worker employed in the agricultural sector comes to about 1.91 ha/person. This average is highest at 4.25 ha/person in Kutch which is quite understandable considering the low density of population in Kutch, followed by Surendranagar district at 3.74 ha/person. This average is the lowest in Panchmahal and Valsad districts at about 0.87 ha/person.

As far as the production of various crops is concerned, it has increased manifold during the last three decades. Table 1 clearly brings out this fact. As can be seen in the Table, the increase in production in 1983-84 over that of 1955-56 is more than 100 per cent in all the crops except cotton and other foodgrains. The increase in the production of sugarcane is almost 10½ times of the production over 1955-56. The increase in production of wheat is almost five times, groundnut is about 4½ times, bajra is more than 3 times during the same period.

As far as the yields of different crops are concerned, Gujarat has remained ahead of all-India yields of majority of the crops. Table 2 gives an indication of increase in yields of important crops in India as well as in Gujarat during the period from 1960-61 to 1982-83. Except maize, the yield of all other crops has increased in Gujarat in the year 1982-83 over that of 1960-61. The increase has been substantially high in case of castor, barley, jowar, wheat and bajra. This has been possible due to introduction of hybrid varieties of crops.

As compared to the yield of various crops in India, the yield of bajra, barley, wheat, castor, sugarcane and tobacco in Gujarat has been higher. The yields of other crops in Gujarat are either marginally lower or are comparable to the all-India yields of these crops.

Also this analysis draws our attention to the fact that an intensive agricultural practices using proper farm inputs, irrigation, etc, is an effective method of achieving the maximum farm productivity. At the same time non-conventional farm crops like horticultural crops need to be developed on the small landholdings so as to ensure better returns to the farmers and higher agricultural employment.

### DEVELOPMENT OF AGRO INDUSTRIES IN GUJARAT

The Economy of Gujarat state shows a propensity towards agro-based industries. Agro industries have developed in the state both in the public as well as private sectors.

The agro industrial development of Gujarat in the areas of textile, fertiliser, sugar, tobacco, edible oils, etc, hardly needs to be mentioned. Several agencies in the public and co-operative sectors have played a definite and positive role in the

TABLE 1

*(Production in lakh tonnes)*

| Crops | Years 1955-56 | 1983-84 | Per Cent Increase |
|---|---|---|---|
| Rice | 2.63 | 7.54 | 187 |
| Bajra | 3.91 | 13.78 | 252 |
| Maize | 1.75 | 4.76 | 172 |
| Jowar | 2.91 | 5.82 | 100 |
| Wheat | 3.26 | 16.26 | 399 |
| Other foodgrains | 4.16 | 6.97 | 68 |
| Total foodgrains | 18.62 | 55.13* | 196 |
| Groundnut | 3.41 | 15.05** | 341 |

development of agro industries in the state.

The Gujarat Agro Industries Corporation Ltd has played a pioneering and catalytic role in the development of agro industries. The wide range of activities of the Corporation includes both the distribution of agricultural inputs, implements, etc, and manufacture of agricultural inputs and processing of agricultural produce, by-products and waste products. GAIC and its subsidiary companies have manufacturing facilities for formulated pesticides, technical pesticides, oil extraction and fruit and vegetable processing.

It may be mentioned that some of the activities taken up by the Corporation have directly helped the farmer by providing him with better quality inputs, such as seeds, manure, fertilisers, insecticides, light diesel oil, agro equipments, aerial spraying, customs hiring in tractors, repairing of tractors, etc, while other activities of the Corporation have indirectly helped the farming community by providing an outlet for processing their crops, by-products, and waste products into industrial or consumer goods which ultimately fetch better remunerative prices to the farmers for their produce.

The Corporation serves the farmers by exporting fruit pulp and juices, fresh vegetables including onions worth more than Rs 2 crore per annum.

The processing of rice bran which was one of the earliest activities of its kind has made significant strides. Every year 13,000 MT of rice bran worth Rs 3 crore is processed. One more unit of similar capacity is also planned to come up.

Beginning as a mere distributor of pesticides, GAIC has emerged as one of the major manufacturers and suppliers of pesticides and insecticides all over the country. It has already hit annual turnover target of Rs 15 crore before the close of the current financial year. GAIC has two formulation units, one joint sector unit for manufacture of technical grade pesticides and insecticides and one more export-oriented unit in joint sector entirely for formulation of pesticides and insecticides is coming up. The joint sector company, i e, Gujarat Insecticides Ltd, has helped break the monopoly of the multinational companies in the field of insecticides and pesticides in Indian market.

The progress and growth of the Corporation in the service of farmer during the last decade is referred in the rise of its annual turnover of Rs 3.28 crore in 1973-74 to Rs 41.72 crore in 1983-84.

The Gujarat State Co-operative Marketing Federation Ltd (GUJCOMASOL) is an apex co-operative body in the state with more than 1,030 primary village and taluka level societies as its members for the distribution, marketing and processing of farm inputs and produce. The turnover of GUJCOMASOL is approximately Rs 275 crore per annum. The society has facility for cattle feed manufacture, oil milling, oil extraction, oil refining, etc. Besides the domestic market of agricultural commodities, the Society also undertakes export of the same.

The Gujarat Co-operative Oil Seeds Growers Federation (GROFED) is serving more than 95,000 farmers through 1,112 village level co-operative societies by processing oil seeds like groundnut, mustard, etc. The turnover of the Federation has crossed Rs 75 crore per annum. The Federation provides inputs to the members and procures oil seeds from them for further processing in their plants. The Federation presently has edible oil seed processing plants in Bhavnagar, Jamnagar and Junagadh. The Federation has plans to extend its operations to the districts of Banaskantha and Rajkot

TABLE 2

*(Yield in kg/hect)*

| Crops | 1960-61 |  | 1982-83 |  |
|---|---|---|---|---|
|  | India | Gujarat | Gujarat | India |
| Rice | 1013 | 547 | 1027 | 1230 |
| Jowar | 533 | 168 | 496 | 663 |
| Maize | 926 | 1221 | 999 | 1102 |

### POTENTIAL OF AGRO INDUSTRIES IN THE STATE

Gujarat provides enough potential for the development of industries based on castor oil, agricultural wastes like rice husk, bagasse, groundnut shell, cotton stalk, etc, molasses, groundnuts, rice bran, potatoes, etc. Also there is a good potential for manufacture of agricultural implements and processing of forest produce, development of small HP gassifier, manufacture of edible grade rice bran oil, extraction of essential oils, etc.

## Tata Burroughs

TATA BURROUGHS (TBL)has once again bagged the nation's highest award for outstanding performance in software export—the Engineering Export Promotion Council's All-India Top Exporters Shield for exports of engineering consultancy, technical know-how and other engineering services. This is the fifth time that the company has won an award for excellence in software and consultancy exports in its six years of operation in this area. According to Prakash Hebalkar, Vice President, International Consultancy Services and Business Planning, TBL has firmly established its presence in 22 countries of the industrialised West and has completed over 300 projects in the most highly competitive computer markets of the world. Apart from projects for Citibank, Yamaha, Swissair, Credit Agricole, Ford, Westinghouse, Miami City Police, Toronto Police etc, TBL was awarded a, huge contract for the development of a global electronic funds transfer system for handling some one million money transfers per day between 800 banks—worldwide for SWIFT. This is of particular significance *vis-a-vis* the vital role that computers are going to play in the Indian banking industry. The company markets advanced computer software packages such as micro-mainframe links as well as packages for real-time foreign exchange trading. The latter package was recently received very satisfactorily by the banking community in London. As part of its commitment to computing, TBL will shortly undertake the manufacture of MICR (magnetic ink character recognition) equipment to computerise cheque clearing by Indian banks. Of the company's total turnover of Rs 15.5 crore in 1984, Rs 14.5 crore was from exports. These figures should show substantial growth as a result of the new computer policy of the Government of India.

# GDDC: An Attempt to Repeat Anand in Saurashtra

AGRICULTURE has been the backbone of the Indian economy. Unfortunately, before independence, hardly any conscious efforts were made to improve technology and increase production. The vagaries of nature only compounded the problems.

The green revolution in the mid-sixties spelt self-reliance in foodgrains production. However, its effect was restricted only to irrigated and larger land holdings. Small and marginal farmers and landless labourers were deprived of the benefits of the green revolution. Hence there was a need for an integrated thrust for the upliftment of these weaker sections. Animal husbandry coupled with agriculture is an important economic tool for the farmers to fight nature as well as the fluctuating market of agriculture.

At the same time, per capita milk availability was steadily falling and the sight of lengthening queues at milk booths in metropolitan cities become a common sight. Private traders exploited milk producers by providing unremunerative prices and also extorted the consumers through adulteration, high pricing, etc. The higher growth in population, stagnated milk production and increased urbanisation were three main reasons for this scenario. In such a market situation, on the one side, there was a lack of motivation for milk producers to improve the breed and on the other private trade failed in their responsibility of sustaining the level of productivity.

It was thought prudent to evolve a structure wherein the private traders could be done away with, so that the bulk of the consumers's money could be passed on to the producer directly thus giving him a remunerative return. The producers co-operative was an obvious choice. This structure was conceptualised to have three tiers, namely village co-operatives, which joined hands with to form a district union, which in turn formed a state level federation popularly known as the Anand pattern, and, first evolved by V Kurien, in Kheda district of Gujarat, as AMUL.

We at the Gujarat Dairy Development Corporation are striving to achieve this end under the Operation Flood programme geared for a white revolution.

The GDDC was set up in 1973 by the Gujarat government with the aim of developing dairying activities in the hitherto underdeveloped Saurashtra and Kutch regions. The task was particularly difficult because of the nomadic nature of the milk producers who migrate towards eastern and southern Gujarat or even to Maharashtra during summer, as also during droughts which is a common phenomenon. Further, the dairy plants earlier established by the state government in this region and which were having extremely limited handling capacities of milk were transferred to the GDDC for efficient management and speedier development of these backward districts so that the milk co-operative at the village level could develop simultaneously without the burden of the plant. After establishing their financial viability the district union would take shape and take over the plant. It is therefore, a unique experiment of a combination of both corporate management and co-operative movement.

### ORGANISATION OF VILLAGE LEVEL CO-OPERATIVE

The village co-operative is the foundation of the programme. This institution is run on democratic lines, with an elected board, to carry out the milk trade in the village. The society is also a nodal agency for provision of animal husbandry services, including animal health cover, artificial insemination, cattle feed, etc. With such a participative effort, it evolves grassroot leadership.

### PROVISION OF TECHNICAL INPUTS

The need for provision of technical inputs need not be overemphasised, since this is the basis of the programme. This activity has a direct bearing on the breeding, feeding and management practice of artificial insemination, which through the most advanced liquid nitrogen-frozen semen technology improves the breed of the animal. Normally, the native non-descript animals are impregnated with the exotic semen, to have an improved cross-bred progeny. In other words, when a non-descript animal, with a litre of milk production per day, is inseminated with the semen of an exotic animal, whose blood is proven to produce 30 litres of milk per day, the resultant cross-bred progeny would ideally produce 15-16 litres of milk per day.

To cover the animals with veterinary medical care, mobile veterinary clinics are operated. The doctor covers each society, once a week for treatment of the animals.

A balanced cattle feed is provided at reasonable rates, to replace the conventional feeds for augmenting the milk production. All these activities are backed up by necessary extension support.

### PROCESSING

Centralised processing facilities are created at the district level, to process the milk collected from the societies and to convert it into milk products, the SMP, WMP, white butter, ghee, cheese, casein, table butter, etc, wherever it is necessary. The pasteurised milk and other products so produced are safe for consumption and storage. Such dairy plants are by far the latest in technology and can compare favourably with any similar plant the world over. The designs of such plants have been standardised so as to facilitate their replication with least time and cost over-runs, elsewhere.

### FEDERAL STRUCTURE

Such unions, formed at the district level, logically federate into a state level apex organisation, to take the benefit of centralised purchase, marketing, R and D, etc, for economics of scale, while at the same time, retaining their autonomy so as to maintain a flexible structure for meeting its local requirements.

### PURCHASE PRICING

Although pricing is an integral part of the procurement strategy of GDDC, it has been taken up separately, since it is one of the most crucial and vital factors for success of the whole movement. In the case of other agricultural products, the government has consciously taken a decision to help the farmer by either having a floor price or sometimes having purchase made through government or semi-government organisations. But the milk producers have been left on their own. The risk in animal husbandry is equally high, like in any other crops, and, the investment of the poor farmers in their animals—the basic raw materials—is almost equally if not more than the investment made in the infrastructure of processing and marketing, the burden of which too falls on the farmers.

It is unfortunate that when milk is the only agriculture product which reaches the consumer in a standard quality and as a guaranteed product, the urban sales prices of it does not reflect the normal demand and supply of economics, and, does not match with the rate of increase in prices of other agricultural products which keep pace with normal market inflation. Further, the milk prices were governed mainly by the prevailing ghee prices in the market and were generally paid on the basis of the quantity of milk supplied, rather than quality. This was because milk was being converted into ghee and butter milk. The butter milk was consumed by members of the households and their neighbours and the surplus was fed to the animals. Thus solids not fat (SNF) which are the essential ingredients of butter milk, were not valued at all. And hence, the milk prices were based on the value realised from ghee. No wonder, the prices of ghee were one and half times that of butter oil (ghee) in international markets

With the establishment of the modern

dairy plants, with fat (ghee) and SNF handling capacities at the district level, the pricing of milk underwent a structural change. Thus instead of milk being valued on the basis of fat alone, it was being valued on the basis of fat and SNF. This is the reason why co-operatives have been able to make a dent in a big way and wherever they have had marginal success, the private trade has been forced to pay competitive remunerative prices. Recent years have witnessed a situation wherein milk prices have out paced the increase in prices of foodgrains, commercial crops and even inflation.

All this is reflected in the faith, the producer members have reposed on the co-operative structure. Their membership now stands at 70,000 for GDDC alone. A notable example is Banni area of Kutch district where most of the developmental schemes had failed due to lack of participation of the inhabitants. But dairying there has been a roaring success, with practically every litre of milk coming into the co-operative's fold. The milk producers of Banni area, who earlier made ghee out of the surplus milk, have entirely stopped ghee production, realising that sale of liquid milk to the dairy is more profitable. Consequently, the Kutch district which occupied a prominent place on the ghee production map of India, has now been obliterated.

Almost 70 per cent of India's milch animal population comprises of cows. Unfortunately, our cow breeds do not compare at all with exotic cow breeds, unlike our buffalo breeds. The difference in milk yield is normally 1:20. Thus a significant improvement in cow breed can be brought about, by cross breeding. In order to promote cow milk production, a special formula (double axis pricing) has been devised, for pricing cow milk. According to this formula, three fourth of SNF is added to the fat content of cow milk, so as to determine the total equivalent kilo fat, and, value the milk accordingly. Thus we find that the cow milk is valued at approximately 80 per cent of the value of buffalo milk, although its fat percentage is almost 60 per cent of buffalo milk! This is a further structural reform over the traditional milk pricing system.

GDDC is now processing approximately 3 lakh litres of milk per day, from 1,400 co-operative societies, spread all over Saurashtra, Kutch, Gandhinagar and Ahmedabad region. Thus approximately Rs 9 to Rs 10 lakh are being disbursed daily all the year round in the underdeveloped areas of Kutch and the backward areas of Saurashtra. Perhaps, no other developmental programme is able to mobilise so much of funds. Further, this has proved to be a platform for rural people to come together irrespective of their caste, creed and religion and promote ideals of democracy and fraternity.

## Pressure Cookers and Appliances

PRESSURE COOKERS AND APPLIANCES Chairman, Brahm Vasudeva, has enthusiastically welcomed the changes announced in the Union Budget and in particular the immediate de-licensing of pressure cookers. He estimates that had his company's profits for the year ended September 1984 been subjected to the tax laws being promulgated by this year's budget, its net profit after tax would have gone up from Rs 52 lakh to Rs 70 lakh. Commenting on the company's future, he says he has every reason to look forward with confidence to the years to come. The company has a growing variety of kitchen-related consumer durables, well accepted for their excellent design and high quality, their utility and convenience. The company is well positioned to both lead and to benefit from the renaissance in the Indian kitchen, and to spearhead some of its products into export markets.

IFFCO

**Indian Farmers Fertiliser Cooperative Ltd.**

**KANDLA**

- A pride of the Cooperative Sector, IFFCO is owned by 40 million farmers through more than 28,000 Cooperative Societies in 17 States and 5 Union Territories.
- IFFCO has emerged as the largest producer and marketer of fertilisers in the country with 3 operating units located at Kandla and Kalol in Gujarat and at Phulpur in U.P. Its contribution to the Nation's total production of nitrogenous and phosphatic fertilisers are 13% and 27% respectively.
- The net worth of IFFCO has consistantly gone up from Rs 37 crores in 1976 to Rs 281 crores in 1983. The value of fixed assets has increased from Rs 94 crores to Rs 343 crores during the same period.
- IFFCO has promoted a multi unit cooperative Society named KRIBHCO for the manufacture of fertilisers with equity participation of Rs 105 crires. It is also a promoter member of Godavari Fertilisers in Andhra Pradesh with equity participation of Rs 6.5 crores.
- IFFCO is participating in a joint venture in Senegal for manufacture of Phosphatic Fertilisers with a contribution of Rs 8 crores to its share capital.
- IFFCO is going to set up a gas based Ammonia/Urea complex with a total cost of Rs 732 crores at Aonla in Barailley District of U.P.
- IFFCO has won FAI's award for best production performance in nitrogen and phosphatic fertilisers during 1980, 1981 and 1982. In 1983 it got best production performance award in nitrogen and second best in phosphatic fertilisers.

**THE FARMER'S OWN FERTILISER PRODUCER**

Indian Farmers Fertiliser Cooperative Limited

one of the CO-OP AGRO GROUP members

# Investment Opportunities in Gujarat

**H K Khan**
Chairman and Managing Director
*Gujarat Industrial Investment Corporation Limited*

GUJARAT is in the throes of an unprecedented industrial transformation, the like of which has not been witnessed by any other state of the country. Formerly, Gujarat was recognised for its textiles or for its historical and political traditions. Today the name of Gujarat (not only in India but also abroad) brings to mind, almost immediately, an industrially advanced state.

When the state was first formed in 1960, it occupied the eighth place in the country in the sphere of industrial development. Today it is ranked second, and if we exclude the city of Bombay, it would occupy the prime position in industrial development in the country. Its rate of growth has been faster than that of any other state. The value added in the industrial sector has grown at the annual rate of five per cent during the decade 1971 to 1980. Small scale industries have recorded a 29.5 per cent growth during the same decade. Investment in plant and machinery has gone up significantly by 59.3 per cent. What is more the industrial scene has witnessed a complete transformation. When the state was first formed, the textile industry was the predominant one. In addition there were only a few light engineering industries in the state.

The period since 1963 has witnessed an amazing change. Today the belt between Vapi to Baroda is covered with pharmaceutical, chemical and petrochemical industries. The state accounts for more than 40 per cent of the pharmaceuticals and drugs produced in the country and is the major producer of basic chemicals, such as soda ash, and has taken the lead in establishing petrochemical industries. Apart from this, in the traditional spheres such as brass parts, ceramics, clocks and synthetic fibres, it continues to enjoy a monopoly in the domestic market.

The progress in the engineering field has not been to the same extent as in the chemical and petrochemical field. Therefore the state government has paid special importance to the development of engineering projects. This has resulted in the growth of small and medium scale engineering industries in Baroda and Panchmahals. With the special incentives announced by the state government for large engineering projects, we can be confident that this decade will see a growth in the engineering industry similar to that witnessed in the chemical industry during the last decade.

In electronics which is the industry of today, and also of the future, and which is already attracting more investment than any other sector of industry, the state has lagged behind some other areas in the country. Today Gujarat accounts for just four per cent of India's total electronics production. The state government has decided to give a boost to this sector. Apart from the special incentives offered for electronics projects, at the behest of the government, the Gujarat Industrial Development Corporation has set up a 230 hectares Electronics Estate at Gandhinagar. The plots in this estate have already been sold and the GIDC has now to look for additional space for a second Electronics Estate. These Electronics Estates are the first of their kind in the entire country.

A number of factors have contributed to the industrial development of the state. First of all, Gujaratis are endowed with a spirit of business and entrepreneurship, unique in this country. It was this spirit which enabled people from the state to open up large areas of East Africa, and, to go even to remote areas such as Fiji to set up business and trade. The inroads made by Indians from this part of the country in the traditional trade in UK, and even in the motel industry in the USA are well known. This spirit of entrepreneurship only required to be channelled in the proper direction. The state government, almost from the very inception of the state, decided that promotion of industries is one of its primary responsibilities. The method adopted was to develop industries through a number of State Corporations. The state established service corporations like the Gujarat Industrial Investment Corporation to finance large and medium scale industries, and, also for the promotion of industries in the joint sector; the Gujarat Industrial Development Corporation for provision of infrastructure; the Gujarat State Financial Corporation for loans to small industries and the Gujarat Small Industries Corporation for providing inputs to small industries.

In addition to these, the state also set up corporations for the development of specific areas like the Agro Industries Corporation, the Export Corporation, and the Textile Corporation, etc. These corporations, from the very beginning, adopted a business like approach to their task. They avoided the mistake made by many corporations in other states of taking over the staff in government departments. They recruited their own staff from the open market and imbued them with the spirit of enterprise. The state government adopted a very pragmatic approach by allowing the corporations to work as semi autonomous units. The directors for these corporations were also drawn from industry and from amongst professionals. These corporations work in close co-operation with entrepreneurs, and being backed by the pragmatic policy of the state government, have helped create a climate conducive to the expansion of industries.

Today there are more than 130 well planned industrial estates across the state. The power position, in spite of numerous difficulties, is presently more comfortable than in any other part of the country. Against the context of labour turmoil that prevails in some cities, Gujarat's labour position is unqiue. There may be strikes in some areas but on the whole the labour situation in Gujarat is one that has attracted the envy of industrialists elsewhere in the country.

More important than the infrastructure, is the attitude towards the budding entrepreneur. Here the corporations have adopted a unique single window approach by creating an Industrial Extension Bureau which caters to the needs of the entrepreneur from conception to completion. He does not have to move from door to door and can get a project report, a complete idea of the incentives available, his allotment of land, forms for financial loans, etc, at one single source. Here it is interesting to note that even when the Government of India was calling its public sector projects as public undertakings, in Gujarat, they were always labelled as public enterprises. This in a way embodies the difference in approach that has made Gujarat such an attractive investment prospect. As a result, it is estimated that a staggering investment of Rs 4,500 crore would materialise in this state in the coming decade through over 175 public, private and joint sector projects. Significant among these will be two large fertiliser plants and petrochemicals complex in south Gujarat, a large automobile plant at Panchmahal, two major cement and a soda ash plant in Saurashtra.

The Gujarat Industrial Investment Corporation was created to serve a dual function of providing loans to large and medium scale industries. Till today the corporation has provided almost Rs 175 crore as assistance to more than 2,400 industries and has helped to generate Rs 645 crore of investment in the state. It has been able to attract to Gujarat entrepreneurs from all parts of the country and even from abroad. In addition to this the GIIC has been a pioneer in promoting joint sector ventures in this country.

The GIIC's promotional role consists of taking a lead in identifying industries which do not exist in the state and which bring a new technology to the country or which utilise the raw materials or cater to the requirements of industries within Gujarat. We have also been attempting to attract entrepreneurs and technocrats from not only different parts of the country but from outside the world. We have with us today 60 projects under implementation which cover the entire gamut of industries from heavy engineering to petrochemicals, chemicals, drugs and pharmaceuticals and electronics. Ten of these industries have already been commissioned and some like Gujarat Alkalies are counted amongst the most successful enterprises in the country. The rest are under implementation. These cover projects such as the soda ash unit, which with an investment of Rs 165 crore is the largest joint sector project in the country, two large cement plants, a plant for making nylon filament yarn and many other projects.

Apart from the large business houses which have joined up with GIIC in implementing these projects, there are a number of technocrats who, armed with their knowledge and expertise, have come to GIIC and have become partners in the adventure of setting up new industries. With such partners, industries for making clutch plates, polybutene and a wide range of products are already set up. Well known non-resident Indians have teamed up with GIIC to set up projects like TV picture tubes, cement, caustic soda, etc. In fact, as of today, we have attracted in this state investment by non-resident Indian totalling more than Rs 25 crore.

The GIIC has also, with the help of the state government, taken the initiative in branching out into new aspects of industry. Thus, it has taken the lead in developing electronics in the state and is today the single largest promoter of electronics projects in the state, promoting nine projects at an estimated cost of Rs 23 crore. These projects include basic component manufacturing units like capacitors, TV picture tubes, walkie-talkie sets and entertainment devices like colour TV sets, etc. In addition there are projects for manufacture of process control instruments, magnetic tapes and nickel cadmium batteries.

The problem of finding new and renewable sources of energy and its conservation have been attracting the attention of persons all over the world. Taking the initiatives in this field too, the GIIC has opened up an energy conservation cell. This cell endeavours to identify and promote energy conservation projects like improvements in boilers, etc. The GIIC will finance, on soft terms, such improvements undertaken by the private industries. In addition, we have been working on new projects like a wind mill farm, white coal and reverse osmosis filteration equipments for sugar and similar industries.

As is known, steel making is almost non-existent in Gujarat primarily due to non-availability of good quality iron ore and coal. However, we are now in the process of setting up a steel making complex in the state with sponge iron, seamless steel tubes and other metal projects.

Another important field which is now opening up, is ship breaking activity, which has been catalysed around Alang in Bhavnagar. This is a good example of how initiative has paid off. Hundreds of people are seeking employment there and with the scrap available, the re-rolling units in Bhavnagar which were closed down, have been revived. Alang has become a centre of attraction for the rest of the country in this respect and we hope that within a short time, it will surpass Karachi as the best ship breaking yard in this part of the world.

All these large complexes—whether it is the fertiliser and petrochemicals complex in south Gujarat or a similar complex in Baroda or the Hindustan Motors' plant, with an investment of more than Rs 200 crore, in Panchmahals, or the ship breaking yard and the steel making complex around Bhavnagar—will cause hundreds of ancillaries to spring up. If this sounds too optimistic, one has only to refer to the example of Baroda which is supposed to have the highest investment per kilometre area next only to Japan.

Today Gujarat offers the most exciting opportunities for investment in the country. In fact, the subject of investment opportunities is a vast and changing one. We have attempted above to point out a few opportunities. Today more and more entrepreneurs, including in the traditional industries like textiles, are engaged in seeking new sources of investment. Persons in the profession are also having an eye on industrial opportunities. Many of our young graduates are thinking in terms of seeking their opening in industry rather than engaging in trade or going in for a profession. It is essential that these persons are shown the opportunities available and are provided the necessary facilities. This is what we have attempted to do and are attempting to do through our corporations and through the Industrial Extension Bureau, that we have created.

A number of profiles are available
show the type of industries that can be
up, the investment required for them, a
the market open for their products. Fina
cial corporations are offering attracti
packages to first time investors in indust
such as loans on soft terms, sales-tax a
income-tax benefits in backward are
and above all the seed and risk capital
reduce the amount of initial investmer
In addition, industrial sheds, power, wat
supply and effluent disposal, are easi
available.

Gujarat, apart from large industries, h
always been known for its small an
medium scale industries and successf
entrepreneurs. The investment oppo
tunities are being seized upon by these e
trepreneurs and the present decade ma
witness an industrial boom which migh
overshadow even the achievements of th
1970s.

## BEL

BHARAT ELECTRONICS (BE
achieved a record turnover of Rs 186 cro
in 1984-85 which was 20 per cent high
than in the previous year. Profit before t
was Rs 27 crore, despite the effect
major investments in three new units a
price reductions given for some comp
nents. Sales per employee went up by
per cent and sales to capital employe
ratio rose by nine per cent as compare
with 1983-84. During 1984-85 several ne
products were introduced in the manufa
turing line like low power TV transmitter
new communications transmitters, rece
vers and transreceivers, automatic ele
tronic switching, time division exchang
(TIDEX), encryption devices, meter
logical and mortar locating radars, las
range finders, passive night vision bin
culars, biangular X-ray tubes, vacuum i
terrupters, etc.

During the Sixth Plan which ended i
March 1985, the company's turnover ha
risen by 124 per cent without significa
increase in manpower. The value adde
per employee has increased by 128 per ce
and the profit before tax has more tha
trebled. The company has been maintain
ing a 12 per cent rate of dividend for th
last 15 years. Construction activities at th
TV glass bulb project at Taloja in Maha
rashtra and the Equipment unit at Panch
kula in Haryana made good progress du
ing the year. Panchkula even initiated pro
duction activities in hired sheds. Among th
achievements of the company during th
year was the successful development an
supply of equipments for Government o
India's crash TV expansion plan which ex
tended the TV coverage to 70 per cent o
India's population.

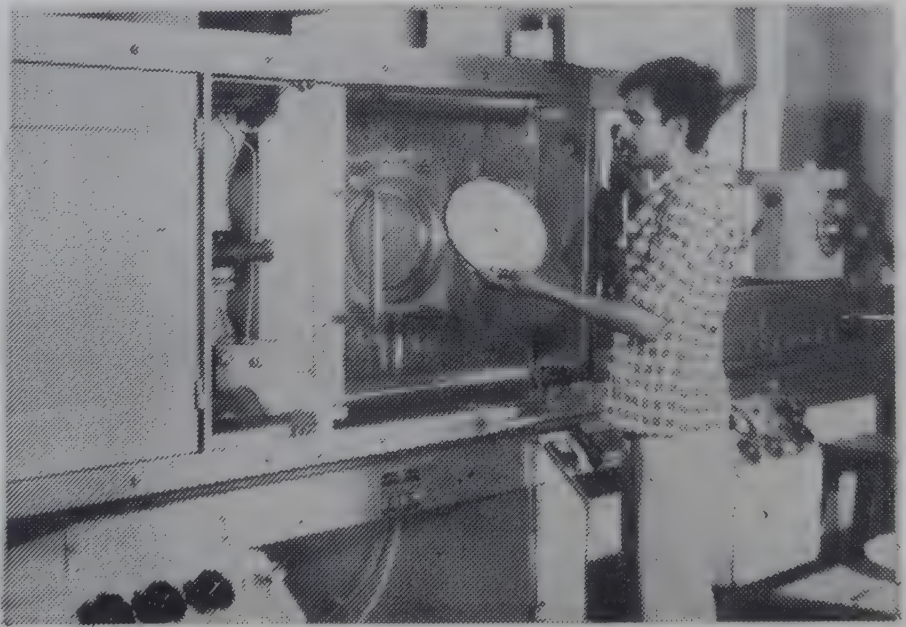
# MODERNISE AND PROSPER...



Navnit/124/84

## .....WITH SOFT LOANS FROM GSFC

You know modernisation is a must for the survival of any unit to adapt to the fast changing environment and technological development. If you have a modernisation programme for your unit for improvement in productivity, product quality, technology or competitiveness and reduction in cost for betterment of profits, GSFC has a soft loan scheme designed for you with several relaxations:

- Low interest rate — a mere 11.5%
- Lower promoters' contribution.
- Flexible debt-equity ratio and margin.
- Simplified loan application form.

Before you go in for the modernisation programme, make sure your unit is in existence and the machinery is in use for atleast 5 years. The benefits of this scheme are available to units eligible for term finance from the Corporation.

# TOWARDS REALISATION OF SOCIAL OBJECTIVES

GUJARAT has launched new scheme for the welfare of coming generation in the Silver Jubilee Year. The Government has become the guardian of 50 lakh children of 30 thousand primary schools of the state by providing mid day meals.

Besides improving the health of children, this revolutionary measure will induce them to attend school. All sections of the society have welcomed the step.

This ambitious scheme has made the employment available at rural level on a large scale. The scheme implemented on the birth day of our late beloved Prime Minister Smt. Indira Gandhi came into its second phase from the 10th December 84. Provision has been made to appoint more cooks and assistants in the schools having large number of children. Their salaries have been increased.

# Gujarat State Financial Corporation

## A Regional Development Bank

GUJARAT State Financial Corporation (GSFC), a development bank for encouraging development and growth of small and medium scale enterprises was set up in 1960 under the State Financial Corporations Act. During the last 24½ years of eventful operations, the GSFC has been instrumental in promotion and growth of over 23,500 units with financial assistance amounting to over Rs 4.7 billion.

### SUSTAINED GROWTH

The Corporation has achieved sustained growth during all these years but rapid strides have been taken during the decade of eighties. The accelerated tempo in the extension of assistance for gearing up the industrial growth in the state could be seen from the Table.

TABLE

*(Rs in million)*

| Period | Sanctions | Disbursements |
|---|---|---|
| 1960-61 to 1969-70 | 185.5 | 115.0 |
| 1970-71 to 1979-80 | 2012.4 | 1201.0 |
| 1980-81 to September 1984 | 2476.2 | 1581.8 |

### NEW INDUSTRIES

A broad spectrum of economic activities is covered with the assistance. The assistance of the Corporation became instrumental in the rapid growth of non-traditional industries/products in the engineering, chemical, pharmaceutical, ceramic and electronic industries. In order to encourage sophisticated new technology industries, the Corporation not only provides assistance to the enterprise having foreign collaboration but also term loans for projects sponsored by non-resident Indians.

### CUSTOM-MADE SCHEMES

The Corporation devised custom-made schemes for various sectors. Basic terms regarding margin, promoters' contribution, amount of loan, repayment period, interest rates were adjusted according to the needs of various segments of the industrial economy. The Corporation devised a special scheme for artisans/craftsmen (mini loans), new entrepreneurs (NES), doctors, economically weaker sections of entrepreneurs (SC/ST) transport operators, fishermen etc.

This helped promotion of many new small enterprises (SSI) by the entrepreneurs with will and skill. The assistance to the SSI sector has gone up very sharply reaching Rs 3.57 billion. The relative share of the SSI sector in number of units assisted is 97 per cent in loan amount sanctioned is 76 per cent.

### NEW ENTREPRENEURS SCHEME

For promoting new entrepreneurs, the Corporation has formulated a special scheme called the 'New Entrepreneurs' Scheme. This scheme was introduced in the year 1973-74 to assist technocrats, engineers, craftsmen, etc, to set up enterprises of their own with their limited resources. The Corporation, therefore, provides them soft term loans upto a limit of Rs 5,00,000 with promoters' contribution of 15 per cent, liberal margin and lower rate of interest. Besides an initial moratorium period of two years is granted for the principal amount and a moratorium of one year is also given for payment of interest. No scrutiny fee is levied from such entrepreneurs. The GIDC gives priority in providing sheds in their industrial estates to such entrepreneurs covered under the scheme. Under this innovative development banking scheme, the Corporation has assisted 946 new entrepreneurs with loans of Rs 156.44 million during the past one decade since the introduction of this scheme.

### MINI LOANS

At a time when term lending institutions were not providing loans below Rs 10,000, the GSFC became a pioneer in granting such small loans in 1970. In order to enable craftsmen, artisans and small borrowers to avail of this assistance, the Corporation provided these loans with a lower rate of interest, liberal margin and simplified procedural formalities. The scrutiny fee was also waived. During the last 14 years since the introduction of the scheme, the Corporation has assisted 5,595 entrepreneurs with loans of Rs 63.80 million.

### SCHEDULED CASTE/TRIBE ENTREPRENEURS

To help the weaker sections of society to beome self-reliant, the Corporation has formulated a special soft loan scheme for entrepreneurs belonging to SC/ST communities. Under this scheme, loans are granted with a promoters' contribution of five per cent, margin of 10 per cent and interest rates ranging from nine to 11 per cent. A longer initial moratorium period upto three years and full repayment period upto 12 years are also considered for such entrepreneurs. No scrutiny fee is levied. Under this soft loan scheme, loans upto a limit of Rs three lakh are granted. The Corporation has assisted 809 such entrepreneurs with loans of Rs 44.70 million during the past six years.

### SPECIAL CAPITAL SCHEME

The Gujarat State Financial Corporation provides special capital to bridge the gap in investment of the entrepreneur proposing to set up a new project in the small scale sector. Loans or equity to the extent of 20 per cent of the project cost or Rs two lakh whichever is less is granted at an interest rate of one per cent per annum. A liberal initial moratorium period upto five years is granted for principal amount and three years for interest payment. The Corporation has assisted 75 entrepreneurs with such soft term assistance amounting to Rs 7.2 million.

### MEDICAL PRACTITIONERS

The GSFC provides loans to qualified doctors to acquire electro medical equipments for diagnostic purposes and to have premises to house the same. In aggregate, loans of Rs 6.07 million have been sanctioned to 71 doctors since the introduction of the scheme. The Corporation has recently liberalised the scheme to spread medical facilities in the rural and semi-urban centres.

### BALANCED REGIONAL GROWTH

In respect of balanced regional growth the Corporation made a pioneering contribution which rose from 17.3 per cent of the total assistance in the first decade of its operation (i e, decade of the sixties) to 46 per cent by end of September 1984. By providing finance with lower margin, reduced promoters' contribution and concessional rate of interest as also with intensive campaign, the Corporation encouraged entrepreneurs to move to the backward areas. The assistance as a result has reached Rs 2.21 billion, to 9,438 units.

### DOOR STEP SERVICE PROGRAMME

The novel Door Step Service Programme initiated by the Corporation in 1981 to promote industrial development in rural and semi urban areas has continued to grow by leaps and bounds. Under the jointly operated programme CED imparts training to a group of 10-15 entrepreneurs, DIC provides help in completing procedural formalities, the GIDC provides infrastructure where needed and the GSFC provides term loan at the door step. 37 centres have so far been covered in the state where 720 entrepreneurs have been assisted with loans of Rs 769.68 lakh. Of these 37 centres covered, 23 have been in the backward areas where 493 entrepreneurs have received assistance from the Corporation.

### SPOT GUIDANCE PROGRAMME

The Spot Guidance Programmes were initiated by the Corporation in December 1983 for guiding, helping and encouraging entrepreneurs, particularly, in the small scale sector. Under this programme, teams of GSFC officials provide guidance 'On the Spot' to new as well as existing entrepreneurs needing term finance from the Corporation for their proposed projects or for expansion/modernisation of the existing projects. So far, the programme has been organised at eight important centres, *viz*, Vadodara, Ankleshwar, Vapi, Surat, Mehsana, Surendranagar, Bhavnagar and Amreli. A programme for counselling entrepreneurs was also organised at Bombay. A joint programme was also held at Bulsar and Vapi. At every centre, the Corporation has received a heartening response. After each Spot Guidance Programme, the Corporation has arranged a follow-up visit by a team of officers of the Corporation to assist entrepreneurs who need help in filling up the forms and complying with the formalities.

## Union Bank of India

UNION BANK OF INDIA has recorded all-round satisfactory growth during 1984. It opened 95 branches, of which 63 were in rural and semi-urban areas, taking the branch network to 1,505. This includes one overseas branch at London. Total deposit resources expanded by Rs 484.95 crore to Rs 2,819.77 crore and net credit increased by Rs 308.47 crore to Rs 1,666.55 crore. Nearly 73 per cent of the increase in credit was accounted for by 'preferred sectors' consisting of priority sectors, food procurement, exports and public sector undertakings. By end-1984, priority sector credit had reached Rs 670.68 crore, increasing by Rs 155.14 crore over the year and the number of accounts increased by nearly 1.30 lakh. The substantial growth carried the share of such credit in total advances past the 40 per cent mark, ahead of the stipulated period of end-March 1985. The three main segments of priority sectors *viz*, agriculture, SSI and others respectively contributed Rs 63 crore, Rs 45 crore and Rs 47 crore to the overall increase of Rs 155 crore. Financial assistance to weaker sections increased by Rs 34.48 crore covering additional 1.11 lakh borrowers during 1984 reaching the figure of Rs 120.95 crore spread over 5.15 lakh borrowers. Under Differential Interest Rates Scheme, meant for assisting the weakest among weaker sections at a concessional rate of interest of four per cent. The Bank's advances stood at Rs 19.90 crore spread over 1.67 lakh borrowal accounts. Further, substantial funds under the scheme were diverted to borrowers of Scheduled Castes Scheduled Tribes. The bank's lending under the 20-Point Programme rose by Rs 52.66 crore to Rs 162.45 crore spread over four lakh borrowal accounts. The increase in the number of accounts was a little under one lakh. By December 1984, as many as 1,131 branches participated in the Integrated Rural Development Programme (IRDP). Advances under the Programme rose to Rs 39.08 crore covering 1.86 lakh borrowers, an increase of Rs 13.85 crore and 61,000 accounts respectively. Credit to SC/ST increased by Rs 10.78 crore or 46.19 per cent to reach Rs 34.12 crore covering 1.79 lakh accounts. The number of beneficiaries increased by nearly 50,000. The Bank's outstanding export credit went up by Rs 30 18 crore to Rs 156.06 crore.

# State Financing Covers Road Spectrum of Economy

A BROAD spectrum of economic activities, are covered by the institutional finance, provided mostly by the State Financial Corporation, and, aimed at promoting rapid industrialisation together with balanced regional growth. The policy of decentralised planning, leading to diversification of industries, has helped in changing the socio-economic condition of the underprivileged.

In the past four years loans worth Rs 227.10 crore were advanced as against the aggregate assistance of Rs 219.80 crore sanctioned in the sixties and the seventies; also Rs 186.53 crore were granted to small scale units as compared to Rs 149.85 crore.

This enlarged financial assistance has become instrumental in the rapid growth of non-traditional industries and products in the engineering, chemical, pharmaceutical, ceramic and electronics and sophisticated new technology industries. It has also covered assistance to enterprises having foreign collaboration, provided term loans in foreign exchange for import of capital equipment and assisted projects sponsored by non-resident Indians.

Emphasis has also been put on growth in backward areas. Such loan assistance, by the Financial Corporation, totalling Rs 105.39 crore was advanced to 2,477 units since 1980. The finance provided with lower margins reduced promoters' contribution, concessional rate of interest and subsidy schemes, has succeeded in encouraging entrepreneurs to move to less developed areas.

In order that the fruits of industrial development percolate to the rural areas, not only for providing gainful employment but also for preventing over-crowding of cities, loans of over Rs 51 crore, to 1,745 units in rural areas, were advanced.

In order to spread industrialisation to the grassroot level, several trailor-made schemes have been devised. Basic terms regarding margin, promoters' contribution, amount of loan, repayment period and interest rates are adjusted according to the needs and capabilities of various segments of the industrial economy within the framework of the refinance scheme of the Industrial Development Bank of India (IDBI).

The new entrepreneurs scheme provides assistance to experienced craftsmen, technicians and new entrepreneurs. Loans upto Rs five lakh, at a lower margin of ten per cent and at a concessional rate of interest, are given to new units. Interest of the first 12 months is capitalised and a longer repayment period of upto nine years is considered under the scheme. Rs 7.87 crore was advanced to 356 new entrepreneurs since 1980.

There is another scheme for the benefit of small borrowers like artisan, craftsmen, etc, known as Mini (Composite) Loan Scheme. Under the scheme loans upto Rs 25,000 are provided both for acquiring assets and for working capital needs on liberal terms and with simple procedures. During the 1980s, 2,306 units were provided such loan assistance totalling Rs 3.63 crore.

Entrepreneurs from scheduled caste and scheduled tribe backgrounds get loans on a concessional rate of interest and on liberal terms upto Rs three lakh, with a margin of 10 per cent and promoters' contribution of five per cent, an initial moratorium period of upto three years and a repayment period upto 12 years. A loan scrutiny fee is not levied for all the three previous schemes for loans upto Rs five lakh. As many as 589 entrepreneurs of SC/ST class were granted Rs 3.05 crore in loans.

Further 69 doctors availed of the assistance given under the scheme for qualified Medical Practitioners. Under the Door-step Service Programme to serve rural urban entrepreneurs, 35 programmes at 33 centres were arranged and 673 entrepreneurs took advantage. 517 units in 167 un-banked centres received loans worth Rs 12.54 lakh under the scheme introduced in 1982.

A Spot Guidance Programme, introduced in 1983-84, provided guidance to 3,452 entrepreneurs at six centres. There is also a Revival and Rehabilitation Scheme for sick and closed units as also consultancy services. All these initiatives have been helpful in accelerating the industrial development in the state over the past four years.

# PORT OF KANDLA

## SEA GATE FOR NORTH-WEST INDIA

First planned major port after independence.

An excellent natural and well-protected harbour.

A port serving the hinterland as vast as 10 lakh square kilometres.

A port planned on modern lines to handle different types of cargo.

The first port in Asia to have a marine unloader with capacity to unload 500 tonnes per hour of free flowing fertiliser/raw material.

The port that has achieved the highest productivity among the major ports in the country.

First port to handle VLCCs (very large crude carriers) with the capacity of 2,60,000 tonnes at offshore oil terminal.

The only port on the West Coast served by both broad gauge and metre gauge rail system.

The port which has already embarked on an ambitious development programme of construction of additional general cargo berths and oil jetty and facilities for container service.

Attractive concessions in tariff available at Kandla for general cargo vessels.

For further details please contact Trade Promotion and Public Relations Officer, Kandla Port Trust, Post Box No. 50, Gandhidham (Kutch) Pin: 370 201.

# FREE EDUCATION FOR WOMEN AT ALL LEVELS IN GUJARAT

## HISTORIC STEP TO STEP UP WOMEN EDUCATION

**Celebrating its Silver Jubilee Year, Gujarat has taken a historic step. Education for women in all faculties at all levels would be free from the next academic year.**

At present free education facility upto 11th standard is offered to women in the State. This will now be extended at all levels in all the faculties of women education.

This glorious decision of the State Government will provide higher education to women and at the same time reduce the financial burden upon the lower and middle class families.

The literacy percentage of women education is lower (32.30) as against male education (54.44). This step will help to reduce the existing gap.

More than one lakh women students taking higher education in the State will be benefitted by this scheme. Gujarat is the first State in the country to implement this historic step.

Glorious decision in the silver jubilee year

## *What brings reliable power supply to over 25 lakh GEB consumers*

## A well planned transmission and distribution net work

The life-line of power system—the transmission and distribution net work. The vital link between generating stations and the consumers, GEB has a well planned net work of sub-stations and feeders—the result of meticulous planning and hard work. Crucial factors like present and future power demand are carefully considered before planning a sub-station. GEB has 240 sub-stations all over Gujarat, linked to 1400 high tension feeders.

To improve power stability and to further reduce Transmission and distribution losses, the first 400 KV sub-station at Asoj is already in operation.

A well planned network means minimum transmission and distribution losses. And better voltage conditions for the consumers. At GEB, work does not end at planning a net work. Maintenance is given equal importance with the result consumers are assured of reliable power supply.

**Gujarat Electricity Board (G. E. B)**

# Petrochemical Industry in Gujarat

**C M Lamba**

**K V Subramaniam**

*Indian Petrochemicals Corporation Ltd, Vadodara*

GUJARAT's climb from the eighth to the second rung, in a span of two decades, on the industrial development ladder is a forceful evidence of its dynamic industrial enterprise. The petrochemical industry's sizeable contribution to this climb is popularly acknowledged.

In this article, an attempt has been made to portray this takeoff by outlining the factors and underlying themes, capturing the petrochemical network as it is today and then dwelling on the future prospects.

Gujarat's proven oil reserves, a systematic effort at oil recovery by ONGC and the setting up of India's largest refinery at Koyali by IOC, set the foundation for petrochemical development. On this foundation, structures for development, based on the entrepreneur capacities of the people and the promise of petrochemical potential, were evolved. This structure, together with the favourable industrial harmony and a progressive outlook of the development authorities, brought in a synergy which has earned a special place for Gujarat in India's petrochemical field.

*Notes:* MTA = Metric tonnes per annum.
Exp = Expected.

Two dominant themes that have underlined Gujarat's development in petrochemicals have been creation of investment opportunities in the areas of plastics, chemicals, detergents, fibre, dyes, etc, and a well meant emphasis on the small scale sector.

It is a salute to Gujarat's pioneering leadership role that, based on the Gujarat model, other states are actively pursuing avenues of petrochemical development.

Before we proceed to capture the petrochemical network in Gujarat, it would be worthwhile focusing briefly on the meaning and scope of petrochemicals. It comes as a surprise to many, that, various items of daily use are derived from petrochemicals. To amplify this link between items of daily use and petrochemicals one can take resort to common examples and highlight the route of manufacture.

Naphtha, a co-product of oil refining, is cracked to ethylene, propylene and butadiene—basic petrochemical building blocks. Ethylene can be converted to polyethylene—a plastic used to pack many consumer products like milk, groceries, etc. Polyvinyl chloride, another plastic made from ethylene, also serves similar uses in addition to plastic footwear, electrical cable insulation, etc. Ethylene can also be converted to MEG, which is used in making explosives and alongwith DMT is used in making polyester fibre. Propylene can be converted to polypropylene—a plastic from which many domestic utility items are made. Propylene to Acrylonitrile can lead to acrylic fibre which partially substitutes wool. Butadiene can be made into synthetic polybutadiene rubber for use in tyres, rubber goods, footwear, sports goods, etc. A cut of kerosene, another product of oil refining, combined with benzene creates linear alkyl benzene which is used to make LAS—a product that contributes to washing powder in detergents. Many solvents derived from petrochemical manufacture are used in making paints, pesticide, insecticide formulations, printing inks, rubber solution, etc. Therefore some aspects are evident—that petrochemicals have an omnipresent evidence in everyday life, they substitute scarce natural resources like wood, edible oil, paper, metal, etc, and most importantly they improve the quality of everyday life.

Indian Petrochemicals Corporation Ltd (IPCL) and petrochemical development could well be described as a cause and effect relationship. The pace for development of petrochemicals was made in 1969 with the formation of IPCL at Vadodara. An infusion of over Rs 400 crore in fourteen integrated plants crystallised in availability of a spectrum of chemicals, plastics, rubber, surfactants, fibre and fibre intermediates by 1979. All these group of synthetic products, which embody the spirit of petrochemicals, catalysed setting up of various downstream units in the private, joint and small scale sectors. Side by side, Gujarat State Fertilisers Co Ltd, set up at Vadodara, and units like KRIBHCO and IFFCO emphasised the petro route to fertilisers. In additon, GSFC made its mark in the petrochemical arena with chemical, fibre and plastic intermediate products.

To the credit of state financial and investment institutions like GIIC, GIDC, GSFC and entrepreneurs, the potential, in terms of products and markets available from IPCL and GSFC, was dovetailed

AN ANGLE OF PETROCHEMICAL NETWORK IN GUJARAT

into the setting up of various projects. To name a few, Gujarat Alkalies and Chemicals, Polymers Corporation of Gujarat Ltd, Petrofils Co-operative Ltd, Calico, Gujarat Carbon, Diamines and Chemicals, Indu Nissan Oxo Chemicals, Petrosynthese Ltd, ABS Plastics, Gujarat Insecticides, Gujarat Aromatics, etc, were manifestations of this dovetail approach.

The small scale sector was equally dynamic. GIDC and other associated small industries development corporations in assistance with petrochemical producers, were able to assist, encourage and motivate setting up of over 2,500 small scale units based on petrochemical raw materials.

Today the evidence is striking—detergent powders at Ahmedabad, plastic processing at Ahmedabad, Makarpura and Nandesari, dye and dye intermediates at Nandesari and Ankleshwar, pesticide formulation at Ankleshwar, Bhavnagar and Vadodara, paint formulation at Vallabh Vidyanagar and Ankleshwar, chemicals and pharmaceuticals at Vapi and Bhavnagar, and industrial engineering oils at Vadodara—all in the small scale sector.

To bring out graphically, this development, a chart has been attempted. This chart snapshoots the network of petrochemical development in Gujarat.

The quantitative contribution is better expressed as a percentage share of the nation's total production. Gujarat today accounts for a sizeable share of national output in many products—cotton cloth (24 per cent), viscose yarn (24 per cent), stoneware (42 per cent), sheet glass (32 per cent), etc, and in the field of petrochemicals and associated areas the share assumes the figures depicted in Table 1.

Today Vadodara is sometimes described as a seat of the petrochemical industry—a tribute to the sustained efforts at providing infrastructure and resource support by various governmental agencies.

The horizon, in Gujarat's petrochemical field, presents a picture of promise. Over 2,000 crore of rupees are planned to be infused over the next 10 years culminating in production of over 20 lakh tonnes each year of useful petrochemical products. Some of the schemes being implemented are shown in Table 2.

Today, Gujarat can take pride in the fact that it has been the torch bearer in the field of petrochemicals. Through petrochemical products, Gujarat has been able to improve the quality of everyday life, conserve vital natural resources like wood, paper, edible oil, metal, etc, and most importantly been able to show the lead to others.

## Raasi Ceramic Industries

RAASI CERAMIC INDUSTRIES, a member of the successful Raasi Group, is setting up a plant for the annual manufacture of 6,000 tonnes of vitreous sanitarywares at Isnapur in Medak district of AP. Technical know-how and detailed engineering services for the project are being provided by Neiveli Ceramics and Refractories (NEYCER), a leading manufacturer of sanitarywares in the country. The project is estimated to cost Rs 6.90 crore, including margin money for working capital of Rs 29 lakh. This is proposed to be financed partly by equity capital of Rs 215 lakh. Of this, Rs 120 lakh is being subscribed by the promoters, directors and their friends, APIDC and Raasi Cement. The public is being offered Rs 95 lakh in equity shares of Rs 10 each at par. The subscription list opens on May 15. The issue is managed by the Merchant Banking Division of ICICI. Trial runs are expected to commence in July 1985 and commercial production in the subsequent month. According to B V Raju, a dirctor, the company is eligible for Central subsidy and concessional finance from the financial institutions by virtue of the location of its plant in a backward area. The demand for sanitarywares has been on the rise in the past few years and this trend is expected to be sustained in the coming years. The home market apart, there is also a growing demand for sanitarywares from West Asia, South East Asia, Africa and Bangladesh and Nepal. The break-even point of the plant is estimated at around 55 per cent of the full capacity. The company expects to achieve a turnover of Rs 4.5 crore in the first year of production, Rs 5.5 crore in the second and Rs 7 crore in the third. Investors in the company's shares will be entitled to benefits under Section 80 CC and 80 L of Income-tax Act and also Wealth Tax benefits.

**Chorwad—India's only beach palace resort where time and tide wait on you**

Chorwad—one of Gujarat's loveliest beaches, where thundering surf, golden sands and swaying casuarina complement the timeless graciousness of the Palace
At Chorwad, you can spend sun-filled days lazing in the sand, horse riding or sight seeing
The resort is equipped luxuriously with exquisite rooms, marble baths, exclusive lounges, swimming pools, game and card rooms and video facilities
Two restaurants offer exciting vegetarian and non-vegetarian fare and fresh sea-food. Come. A royal welcome awaits you

**Accommodation:** 75 rooms to suit every budget—a choice of palace, cottage, deluxe and economy rooms

**Business facilities:** Conference Hall with secretarial facilities

**How to reach:** Nearest airport is Keshod, 38 km which is linked to Bombay Nearest railway station is Chorwad Road Transport to and from airport and station is available.

**Nearby places of interest:** Somnath—38 km, the renowned shrine with the foremost jyotirlinga Sasan Gir—80 km, the natural habitat of the Asiatic lion, Porbandar—80 km, the historic town where Mahatma Gandhi was born, Ahmedpur Mandvi—125 km a beautiful beach resort with modern facilities. Diu—125 km, the earlier Portuguese colony, has an ancient fort and an excellent beach

# Gujarat's Efforts Towards a More Innovative Administration

THE Gujarat government has taken various measures to provide a more innovative administration. Right from the launching of the pending cases disposal drive in Sachivalaya, numerous steps were taken, like holding "Lok Adalats" in remote tribal areas to settle long standing cases on the spot and thereby provide justice to people at their door-steps.

To accelerate the uplift of tribals the Tribal Welfare Department has been separated from the Social Welfare Department so that greater attention can be focused on their welfare. A Tribal Development Commissionerate has been set up under the Tribal Development Department to effectively monitor programmes for the speedy uplift of scheduled tribes.

A special monitoring cell at the state level has been set up for ensuring speedy implementation of the programmes for scheduled castes and scheduled tribes. A high level committee under the chairmanship of the Chief Minister has been constituted to review schemes under the Special Component Plan. To ensure quick justice to tribals, Special Civil Courts have been established in tribal areas. The Integrated Programme for upliftment of scheduled castes has covered 46,000 families belonging to scheduled caste so far.

A separate Commissionerate for Rural Development in Agriculture has been created to bring all the programmes relating to rural development under one roof. A separate post of Rural Labour Commissioner has been created to improve the conditions of rural labourers.

To streamline the administration a separate Department of Fisheries and Ports has been created. The Gujarat Maritime Board was set up in April 1982 for the integrated development of ports in the state. The cargo turnover, which was 25 lakh tonnes in 1979-80, has increased to 42 lakh tonnes.

The launching of a mid-day meal programme for primary school students has proved a great success. High priority is being allotted to technical education. A state level council for Science and Technology has also been set up and a separate secretary for Science and Technology has been appointed.

For ensuring proper supply of essential commodities the Gujarat State Civil Supplies Corporation was formed in October 1980. The Corporation runs mobile shops, to provide basic necessities at cheap prices in the remote rural and tribal areas.

In order to pay greater attention to welfare programmes designed for the urban poor as well as to impart greater impetus to urban housing and a separate department of urban development and urban housing has been set up. The Gujarat women's development corporation was set up in March 1981 to implement schemes for uplift and rehabilitation of women.

Various steps have been taken to modernise the working of the state police so as to improve the effectiveness and mobility. New police commissionerates were set up in Surat, Vadodara and Rajkot. The state police force has been equipped with new vehicles, wireless sets, a forensic science laboratory and a computer centre.

A separate department of Forest and Environment has been created to devote greater attention to the problems relating to ecology and environment. The Gujarat government has also introduced computer services to pace up the administration. The basic amenities available at the village-level in each district, has been computerised for three districts where computerised monitoring of plan programmes has been adopted.

For ensuring justice to the poor a Legal Aid and Advisory Board was set up in 1982 under the chairmanship of the Chief Minister. The Chief Justice of the Gujarat High Court is the co-chairman of this Board. Over 4,340 persons have so far benefited. During the last two years 78 camps of Lok Adalats were held handling over 19,800 cases. The camps were mostly held in rural areas.

A separate Narmada Development Department has been set up for the accelerated implementation of the Sardar Sarovar Project. The other important steps include creation of Municipal Corporations for Jamnagar and Bhavnagar cities, new labour courts, and an industrial court at Rajkot, creation of nine teams for records of rights in rural areas, a new department of textiles to solve the problems of closed mills. Thus it can be seen that the state government is moving ahead to tone up its administration with tangible results.

# your enterprise and GIIC expertise work wonders

GIIC expertise in promoting industrial projects equals your enterprising spirit.

That is how, GIIC's seven sponsored projects in joint and public sector have gone into production involving total outlay of over Rs. 65 crores.

Carrying forward the same belief GIIC has another 50 projects in different stages of implementation. All these projects involve a gigantic capital outlay of about Rs 1200 crores.

Through these projects and the expertise of several entrepreneurs, GIIC is sure to develop key industries, vital for Gujarat and national economy. Almost all types of industries have been planned – **engineering, electronics, chemical, petrochemical, pharmaceutical, plastic,** cement and so on.

Virtually, GIIC backs every viable venture which you are confident of.

'How to give your product a strong backbone'

Petrez

Aromatic Hydrocarbon Resin

Golden coloured Petrez. The innovative resin. The backbone of products like rubber, paints, adhesives and printing inks. Specially created in a range of softening points varying from 70 ± 5°C to 130 ± 5°C (DIN 53180), to suit your specific need.

Now from IPCL in technical collaboration with CdF Chimie of France.

Petrez is the uncontested choice when you are looking for a resin that is economical, chemically neutral, and is compatible with other resins.

Petrez is an economical substitute for wood-rosin and the more expensive coumarone indene, terpenic and alkyd resins. This means your profitability goes up, while your quality remains as good as ever.

Petrez is just right.

Now available from IPCL and its regional offices.

# Growing Arsenal

18 JUN 1985

THE transistor bomb attacks by Sikh terrorists have supposedly obliged the government to bring forward the Terrorist and Disruptive Activities (Prevention) Bill and get it passed by Parliament in frantic haste. Actually the events since the bomb explosions have demonstrated clearly that the government does not need any fresh powers to deal with terrorism; the police have been able to arrest whoever they wanted to, secure their remand for extended periods (of course, with no question of any of the arrested persons being granted bail by any court) and 'interrogate' them without let or hindrance—so thoroughly in fact that three at least of the arrested suspects have already died in police custody and even that has not created any legal hassles or even public protest. If the government has failed to contain terrorism in Punjab, as indeed it has, this is not because it has lacked the required legal powers but because its security and intelligence forces have been inept and, more important, because its handling of the situation in Punjab over the last many years has created an environment conducive to the growth of terrorism. As far as the last mentioned factor is concerned, what is called for is not the enactment of yet more draconian laws but the undoing of the unfortunate consequences—in terms of the sense of fear, disaffection and alienation that has been created among large sections of the Sikhs in Punjab—of the use of the already enacted special laws such as the Punjab Disturbed Areas Act, the Armed Forces Special Powers Act, the Terrorist Affected Areas (Special Courts) Act, and so on.

The Terrorist and Disruptive Activities (Prevention) Act has therefore to be viewed more generally as yet another piece of legislation enhancing the police powers of the government and correspondingly abridging the civil rights of the people. While rushing the Bill through Parliament the Law Minister sought to assure opposition MPs that the new law would not be used against political parties and the government's political opponents. However, what would have been more relevant was to know from the minister, not when or against whom the law would not be used, but whether it would in fact be used in situations to which it clearly applies. The new Act defines 'terrorist activities' to include use of bombs or explosive or inflammable substances or firearms or other lethal weapons with the intent to overawe the government or strike terror in any section of the people or alienate any section of the people or adversely affect harmony among different sections of the people. If such action results in the death of any person, the Act prescribes the death penalty; in other cases the punishment prescribed is imprisonment for a term which will not be less than five years but which may extend to a term of life. The definition of 'terrorist activities', it will be seen, exactly fits cases of attacks against the rural poor and against dalits and backward castes as well as instances of communal violence ('use of firearms, inflammable substances or other lethal weapons' to 'strike terror in a section of the people' or to 'adversely affect harmony among different sections of the people'). All too often in these attacks the victims are killed and not always in ones and twos but in large numbers sometimes. Will the Law Minister affirm that the perpetrators of these 'terrorist activities' will henceforth be proceeded against under the Terrorist and Disruptive Activities (Prevention) Act? Will those responsible for a latter-day Kilvenmani or Belchi or Ansari Baug (where some 30 Muslims were massacred in last year's communal riots in Bhiwandi) be punished as prescribed by the new Act?

No, never; of that one may be sure. These criminals will continue to go scot-free; or if apprehended, to be charged under the mildest sections of the Criminal Procedure Code and the Indian Penal Code; and even thereafter the evidence against them will be so diluted by an obliging government that more often than not the courts will continue to be able to let them go with quite a clear conscience.

It is against this established pattern of highly selective use of laws that the vast powers with which the Terrorist and Disruptive Activities (Prevention) Act has now armed the government have to be viewed. Under the Act the government is empowered to make rules to impose censorship ("preventing . . . the spread . . . of reports . . . likely to cause disaffection or alarm or to prejudice maintenance of peaceful conditions in any area or part of India or to promote feelings of ill will"), to tamper with postal and telegraphic communications ("delaying, seizing, intercepting or interrupting of postal articles or telegraphic or telephonic messages"), to prevent normal political activity ("prohibiting or regulating meetings, assemblies, fairs and processions"), and so on. The rules made would also provide for arrest, trial and punishment of persons contravening any of the rules and seizure, detention and forfeiture of any property in respect of such contravention. The Act empowers the government to dispense with the normal safeguards for ensuring fair trial by constituting special courts, called 'designated courts', for trial of cases under the Act. The proceedings of the designated courts would be secret and the identity and addresses of witnesses may also not be disclosed. Appeal from any decision of a designated court will lie only to the Supreme Court. The police can seek initial remand of a suspect for 60 days and can then keep him in remand for a total period of a whole year without furnishing the charge-sheet.

Who can say that the legal framework for a police state is not being speedily assembled?

## *Andhra Pradesh*

### No Mid-Day Meals for Poor Children

*M Shatrugna writes:*

THE abrupt discontinuance of the much publicised mid-day meals scheme (MMS) of the Andhra Pradesh government exposes not only the slipshod manner in which the scheme was formulated and implemented but also the triumph of vested interests at all levels in the administration in scuttling another programme meant for the weakest among the poor—children of the rural poor.

The MMS which formed a part of the 1982 election manifesto of the Telugu Desam had been actually inaugurated by the then Congress(I) Chief Minister K Vijayabhaskara Reddy on November 14, 1982, just before the 1983 assembly poll, to 'prove' that it was a programme of the Congress Party. The Congress(I) sanctioned as much as Rs 38.40 crore for the programme for the period between November 1982 and March 1983. The aims of the scheme were (1) to raise enrolment in primary schools, (2) to improve school attendance and reduce the number of drop-outs, (3) to provide nutritious supplementary food, and (4) to gradually reduce feelings of caste and creed distinctions among children. Initially, under the programme a bun of 50 gm and 100 ml of milk per day per head were to be supplied to roughly 35 lakh children studying in classes I-V in all primary schools in the state. The scheme was to be in addition to the earlier CARE programme being implemented in the five coastal districts and the ready-to-eat (RTE) programme in Hyderabad and Secunderabad.

In a note presented to the state assembly in March 1983, the government claimed that the MMS had successfully achieved the first three objectives, though it had failed in the fourth, *viz*, that of getting children belonging to the upper castes to share the meal with lower caste children. It was estimated that more than one lakh extra students had been enrolled due to the MMS. To make the scheme more viable—though this amounted to diluting the fourth objective which in any case had not been achieved—it was decided to limit the scheme to children belonging to scheduled castes and tribes, backward castes and economically backward classes.

The NTR government allocated Rs 50 crore in its 1983-1984 Budget. It also decided to appoint separate staff to prepare food for the MMS, relieving teachers of the additional burden. The district collector was made overall incharge of the scheme. Local bodies, including mahila mandals, were entrusted with the preparation and distribution of food. Of the Rs 50 crore allotted, Rs 40.50 crore was meant to go for the cost of the food and the rest was to meet establishment charges.

But the scheme soon came under attack from different sides. While ruling party MLAs alleged that local bodies headed by Congress(I) supporters were not implementing the scheme in earnest, the non-Congress(I) opposition legislators were inclined to write off the scheme as a 'failure' and suggest that the state's 'meagre resources' should be directed to more useful areas, such as construction of school buildings. These legislators did not seem to realise what a potent inducement food was to draw children of the deprived sections to schools.

Though the government had claimed that the three major objectives of the scheme had been achieved, its Budget for 1984-85 actually showed a cut in allocation for the scheme to Rs 33 crore. At the same time, in a second report on the scheme presented to the assembly in March 1984 the government said it was 'optimistic' that over 40 lakh children would be covered by the scheme. The enrolment of scheduled caste students had apparently gone up from 10.67 lakh to 11.30 lakh and that of scheduled tribe students from 2.77 lakh to 3.20 lakh between March and December 1983. However, the lengthy note also conceded that the Rs 33 crore allotted would be sufficient for only 140 days in the year whereas the number of working days in schools were 220. The note 'hoped' that the diet consisting of rice (100 gm), dal (15 gm) and oil (5 gm) would give each child 10.1 gm of protein and 450 calories of energy.

Against this background, the state's 1985-86 Budget presented in March, came as a shock. It made no mention of the scheme at all. And now its abandonment has been formally announced. The reason advanced is that there was 'corruption' at all levels of the implementation of the scheme. The real reasons are different, however. First, the local authorities belonging to the upper castes never liked the scheme meant for the poor. Especially after it was decided to restrict the scheme to the scheduled castes and tribes and the backward classes, even the little enthusiasms the local bodies had initially shown died down. Even the non-Congress(I) opposition parties attacked the scheme instead of making concrete suggestions to improve it. All in all, it is ironic that a scheme meant for the children of the rural poor should be wound up so summarily, with hardly a voice raised in protest, in the first year of the 'Decade of the Child'.

## *IRDP*

### Reworking the Sums

ABOUT two years ago, while releasing the Mid-Term Appraisal of the Sixth Five-Year Plan, the Planning Minister and the Planning Commission had spoken ecstatically of the grand strides made in eradicating rural poverty. As many as 34 million poor persons were claimed to have been pushed above the poverty level in 1980-81 and 1981-82 by specially targeted measures, chiefly the Integrated Rural Development Programme started in 1980. Analysts strongly contested this claim, proving it to be largely unfounded. Possibly the criticism has had a sobering effect. The Union government is now making claims about the rural poverty programmes in a somewhat guarded and quieter manner.

The Sixth Plan document had envisaged that roughly as much as a third of the rural poor would be lifted over the poverty line between April 1980 and March 1985 by schemes like the IRDP. In this context an official press release, issued by the government this week, has made the claim—apparently more out of bureaucratic routine than with any evident conviction—that the IRDP had succeeded in eradicating poverty amongst 15 million households during the Plan. The statement does mention certain qualifications. The small scale industries that the beneficiaries had set up, it notes, could survive only if back up services like the supply of raw materials, quality control and marketing were made available by state governments. The release also mentions that certain evaluation studies had pointed out that the malfunctioning of the IRDP, in such matters as wrong identification of the poor, was because the District Rural Development agencies did not adhere to the prescribed procedures and guidelines. In other words, the government is making a not so subtle attempt at shifting the blame for shortcomings of IRDP onto other bodies, such as the state governments and district authorities who are also involved in the scheme.

But such issues are indeed peripheral when compared to the claim of the impact in terms of eradicating poverty. The Planning Commission's method of computing the effectiveness of the IRDP during the Sixth Plan is evidently the same as the one on which the Mid-Term Appraisal's calculations of rural poverty eradication were based. Amongst the 15 million households that supposedly benefited from the IRDP are the 2.72 million families uplifted in each of the first two years of the Plan, i e, 1980-81 and 1981-82. Sundaram and Tendulkar have, after a critical evaluation, punctured the claims made in the MTA for 1980-81 and 1981-82 (*EPW*, June 30, 1984 and November 5-12, 1983). Their criticisms would necessarily hold for the entire Plan period too and are therefore worth recapitulating briefly.

The effectiveness of the IRDP depends on the consumption gap to be bridged so as to just cross the poverty line and the income increment flowing from the financial resources transferred to the beneficiary. The financial resources transferred consist of a subsidy component and a loan component. The subsidy component in turn depends on how much of the Plan funds utilised under IRDP are available for providing subsidies to the beneficiaries after meeting the financial requirements of development administration and infrastructural development. It is also well known, Sundaram and Tendulkar point out, that there are 'leakages' between the amounts shown in official records as resources transferred to the beneficiaries and those actually reaching the hands of the beneficiaries. Then the location of the beneficiary household within the consumption distribution and whether it in fact receives the average income increment are other factors to be taken into account. On considering all these issues Sundaram and Tendulkar noted that in the two years together 2.72 million households or, on the assumption of an average household size of 5.2, 14.14 million persons could have been lifted above the poverty line on account of IRDP. But then, as they further pointed out, the existence of 18 or more million additional people is not recognised by officialdom because of their steadfast refusal to correct the census totals for the undercounting evident from post enumeration checks, which itself are known to undercount the population in the 0-4 group. On these very grounds, even without a similar study for the entire Sixth Plan period, it can be safely concluded that the Planning Commission's claims of poverty reduction are a paper exercise.

## *United States*

### Less Bangs Per Dollar

DEFENCE appropriations in the US over the past four Reagan years add up to over a trillion dollars, over one-third above those for the four years immediately preceding. For 1985-86, the original proposal was to raise the provision by a further 6 per cent. It is now doubtful if Congress will approve an increase of that order. The US Senate wants to keep the defence appropriation at the same real level as in 1984-85. The US House of Congress wishes to keep it at the same absolute level and not even allow for the inflation factor. Clearly, the wind is blowing in the direction of a freeze on defence spending.

Whatever level of defence appropriation is ultimately agreed upon, the most interesting aspect of the discussion on the subject is that in spite of the pleas from the Administration about the absolute urgency of the proposed increases in defence spending, very few are taking these pleas seriously. While in February 1980, three out of five Americans were in favour of increased defence spending, today not even one out of ten favours that.

What could this change in American attitude be ascribed to? Certainly not to lack of trust in the Administration that was voted back to power with a massive majority hardly a year back. An important factor is perhaps the revelation in recent months of the gross mismanagement and waste that pervades defence spending in the United States so that increased defence allocations have, as a Republican Senator puts it, "actually bought high costs and overheads rather than more tanks, ships and planes". The argument that the present Administration has gone in for much more sophisticated arms does not bite in view of the unending stream of revelations about the way US defence contractors have over-charged and over-billed their own government.

A recent study of the Congressional Budget Office showed that while funds for aircraft rose 75 per cent in constant dollars between 1977-80 and 1982-85, the number of planes increased by only 9 per cent. Also the number of missiles purchased rose by 6 per cent despite a 91 per cent funding increase. Major US corporations like General Dynamics and General Electric have been found to be indulging in fradulent practices in order to claim excessive amounts from their government in the fulfilment of their defence contracts. The story of how toilet seats were billed at the rate $ 600 a piece, one hammer cost the Pentagon $ 435 and four-cent diodes cost the department $ 110 each have been making news for quite some months now. Most recently, General Electric has admitted to over-charging the department in cost over-runs on Minuteman missile contracts. Of $ 28 billion sales by the company in 1984, one-fifth was accounted for by sales to government. The company managers forged employees' time cards and juggled figures in such a way as to switch cost over-runs from the fixed price part of the company's contract to the cost-plus parts of the contract.

The House Armed Services Committee has just put out the names of seven big companies, General Dynamics, Sperry, Tenneco, Textron, Mcdonnell Douglas, Rockwell and Boeing, which have over-billed the government to the tune of $ 4.3 billion between 1972 and 1982.

It is because of these reports that the US Administration finds itself in a corner. Although the President continues to resist strongly demands for any reduction in defence spending, he has already given his consent to the Senate's formula for zero real growth. He may well have to agree to a freeze in absolute terms as demanded by the Lower House. But whether or not he and his administration would draw the right lesson, *viz*, increased defence spending does not amount to increased defence, is yet to be seen. This is a lesson for others as well, not just the US Administration.

# Import-Based Consumption Boom

THE vanaspati industry has, it would appear, succeeded in its efforts to prevent any major change in government policies on supply of imported oils to the industry. At one time the industry had feared that, in an attempt to reduce the import bill on account of edible oils, the government might drastically cut the allocation of imported oils for vanaspati production. The government has been under pressure to do this also from oilseeds farmers and oil processors. However, the latest indications are that the vanaspati industry will suffer a cut of no more than 5 percentage points in its quota of imported oils. The industry currently gets imported oils to meet 60 per cent of its requirements; this may now be reduced to 55 per cent. Against this, the industry has been allowed to use solvent extracted mustard/rapeseed oil to the extent of 10 per cent of its oil requirements from June 1. This was announced by the Union Food Minister earlier this month.

What the vanaspati industry's agitated response to the prospect of a cut in the supply of imported oils has brought out is that the industry has come to regard that it has a permanent right to be supplied with imported oils. The responsibility for spoiling the industry in this manner is, of course, the government's. Till March this year, fully 95 per cent of the industry's requirements of oils were being met through imports; 65 per cent was made available at a specially low price of Rs 9,500 per tonne and 35 per cent at Rs 13,000 per tonne. In return, the industry is supposed to have accepted informal price control. The price thus fixed is currently Rs 244.50 per 15 kg tin of vanaspati.

There have been doubts about the worth of this informal price control; it has readily broken down whenever there has been a sharp rise in the prices of edible oils. This is hardly surprising since it goes against commonsense to expect that the price of vanaspati can be held below that of vegetable oils. That being so, two questions arise.

First, has it been wise on the part of the government to deliberately stoke the consumption of vegetable oils by importing large quantities of these oils. Thus, despite the 1983-84 oilseeds, crop having been a record one at 12.81 mn tonnes, the import of vegetable oils in 1983-84 (oil year, November 1983-October 1984) too touched the record level of 16.34 lakh tonnes worth Rs 1,319 crore (compared to 11.50 lakh tonnes worth Rs 507 crore in 1982-83 when the oilseeds crop was only 10 mn tonnes). The government has made the same mistake in sugar: in an attempt to prevent the price of sugar from rising, the government has sharply increased the monthly releases of sugar for sale in the open market. The result has been a steep rise in sugar consumption which has compelled the government to resort to import of sugar as well. It is also clear that this consumption bonanza sustained by imports has mostly benefited the well-off. The poor have certainly had little share in the much increased consumption of vegetable oils or sugar in the country.

Second, even if some import of vegetable oils is considered necessary to keep prices in check, is supplying the bulk of the imported oils to the vanaspati industry the most effective way of achieving this objective? An alternative course would have been to use the imported oils for enlarging the supply of oils through the public distribution system. The government is clearly not inclined to pursue this course. In the effort to bring down the import of vegetable oils, while it has shown such tender care for the interests of the vanaspati industry (paring the industry's allotment of imported oils by a mere 5 percentage points), it has effected a drastic reduction in the monthly allocation of imported oils to the state governments for sale through the public distribution system. Thus the allocation for April at 58,670 tonnes was about 20,000 tonnes lower than the average monthly release since July 1984.

Enrichment of the vanaspati industry has, it is evident, become the primary rationale of import of vegetable oils.

## *Jute*

### Evading Basic Issues

IT is unlikely that the condition of the jute industry would begin to improve with the implementation of the Union government's proposal to fix a ceiling on raw jute prices. The ceiling would at best be a kind of patchwork that can hardly overhaul the major long-standing problems affecting this traditional industry. In any case it will be a temporary measure since it is expected to operate only till the fresh harvest comes in July.

Three jute mills, employing 7,000 workers, have been virtually closed permanently. Lockouts are being declared by the managements of several others. Presently as many as a third of the 62 mills in the country lie shut in this manner, affecting a further 72,000 workers. The concerned managements claim that chronic labour problems have pushed them to take such a step. This is contested by the trade unions, including the Congress(I)-led INTUC, who accuse the managements of wanting to maximise their earnings at the cost of the workers and of the long-term prospects of the industry itself. Apparently the Union government too does not accept the mill-owners' claims.

The two-day meeting held in Calcutta this week—attended by Chandra Shekhar Singh, Union Minister of State for Textiles, certain ministers of West Bengal, state and Union officials, representatives of trade unions and of mill-owners—was convened primarily with the intention of finding ways to restart the closed mills. The Union government's plan to fix a ceiling on raw jute prices was announced by Singh after the meeting on May 21.

The price of the fibre did move up to over Rs 1,000 per quintal in early 1985, i e, to more than four times the level prevailing in 1982. But since the past month or so the price has been declining, probably partly because of the fall in demand resulting from the closure of the 21 mills. Also, the demand (and price) of finished jute goods, which had spurted to a new peak in November-December 1984, has considerably slackened and thereby contributed to the dampening of the demand for raw jute. Then it is also likely that the traders-industrialists, who had hoarded the fibre for speculative purposes, may have started unloading their stocks. This is because the fibre price has slumped from its peak and the coming crop is estimated to be a much bigger one than the crop of 7.3 million bales in 1984-85.

The imposing of a ceiling on the fibre's price might help further depress its price. But it is doubtful whether such a measure will lead to a re-opening of most of the closed mills. The ceiling will have to be sufficiently low to induce the owners of the 21 mills to restart their operations. But then the traders would be unwilling to off-load their stocks at a low price, *vis-a-vis* the peak attained over the past year, on the plea of running into losses. The Union government has threatened to take penal action against hoarders. But past experience indicates that such threats are seldom implemented seriously. Ironically the public sector Jute Corporation of India will turn out to be a major loser if the ceiling is imposed. The JCI has been purchasing the fibre even in the lean season and not exclusively during the harvesting months as it is expected to. The Corporation, apart from thereby aiding the speculators in their activity, has paid a higher price for such off-season purchases. A price ceiling lower than the JCI's purchase price would mean a loss to this Union government undertaking.

The Textile Minister had added that attempts to revive the demand for jute goods would be made by ensuring that government undertakings like the Food Corporation of India, which are amongst the principal buyers, place additional orders. However this expected fresh demand may still not be sufficient to reopen all the mills. Cheaper synthetic substitutes like HDPE packaging are already being used in the country, particularly following this year's steep hike in the price of jute goods. The effectiveness of the Union government's resolve to stop further expansion in the use of synthetic substitutes remains to be seen. All in all the squeezing out of the maximum returns by the millowners (and traders) without bothering to modernise and reduce costs has now boomeranged in the form of synthetic substitutes.

## *International Monetary System*

### Squeeze on Third World

THE currently prevailing world monetary and financial conditions are imposing heavy costs on developing countries, including severely constraining investment in these countries, on which genuine adjustment and sustained development depend. This is the finding of a Report by the UNCTAD secretariat on "The International Monetary System and Financial Markets: Recent Developments and the Policy Challenge".

The report states that the tight monetary policy of the United States has not forestalled recovery in that country because of its expansionary fiscal policy, but it has constricted the policy options of other developed market-economy countries, influenced exchange rates, and increased the debt burden of developing countries. The developed market-economy countries have in principle the option of using fiscal instruments to avoid many of the consequences of the rise in dollar interest rates, thereby making the world recovery stronger and more robust. The developing countries have no such means to offset the impact of United States monetary policies or of other external shocks. Their reserves and liquidity have dried up, while private flows in the form of bank lending and export credits have contracted; indeed, the net transfer of financial resources is negative for many countries. Such financing as is available from private and public sources is for the most part conditional on monetary and fiscal retrenchment.

International bank lending to many of the developing-country borrowers, the Report continues, no longer reflects normal market processes but collective decision-making in which lenders have the predominant voice. The aim is, on the one hand, to prevent banks from so restricting their lending that debtor countries are unable to meet the interest due and, on the other hand, to ensure that debtors take whatever measures are needed to improve their trade balance. The possibilities of their doing so *via* import cuts having been exhausted, export expansion is now being emphasised. The scope for export growth, however, is limited both by the supply capabilities of developing countries and by demand-side factors, including protectionism. Consequently, efforts to 'adjust' quickly *via* expenditure reduction and devaluation tend to result in severe deflation and social conflicts, and to put at risk the terms of trade and long-term export capabilities.

However, an investment-led strategy of export expansion and import substitution, which is a *sine qua non* for successful long-term adjustment, is being made extremely difficult by the stringency in private financial markets; by the constricted supply of liquidity, payments support and long-term financing available from official sources; by the exceptionally high level of interest rates; and by the slow pace of recovery in developed market-economy countries.

## LETTER TO EDITOR

# Marxism in India

THE essay in the 'Perspectives' section of *EPW* of March 30, ('Marxism in Punjab' by Pritam Singh) raises interesting questions with refreshing directness. It is time people cut through the undergrowth of special jargon to reach towards realities. The lessons of Punjab seem to me applicable, with suitable modifications, to other regions of India.

The essay is outspoken in its criticism of the stagnation of the left parties. The apparent symptoms of stagnation are intellectual backwardness and lack of political initiative as well as a spirit of conformity imposed by the leadership on the ranks. Though the author does not say so explicitly, it seems that the failure to deal with new social developments politically and intellectually stems from the same root. The rural petit-bourgeois base of the major left parties seems to have led to a politics of economism and reformism rather than revolutionary advance. Hence the neglect of theory as well as failure to respond to new circumstances and social forces.

Incidentally, the notion of a 'monolithic discipline' developed in a backward autocratic environment in Russia, and under Stalin it acquired a ruthless character during a period of imperialist encirclement. It is a moot point if present-day parties should stick to that tradition, especially if it becomes a fetter on further growth. If the few formulas developed under Comintern guidance have ceased to be fruitful, intellectual and political conformism ought to be abandoned in favour of fresh Marxist analysis and understanding.

The essay goes on to remark that on the cultural front the left has been very active. It has reportedly fought vigorously against communalism, oppression of women, etc, through theatre and other media. But the point is that unless the politics of the party is on the frontline of social development, other forces than the left are likely to benefit from such progressive cultural work. The Central government for example is likely to be pleased with the impact of such cultural work against Akali obscurantism.

The essay refers to the specificity of the Sikh problem which defies conventional formulas. Unless the author supports, a Sikh state, whether within or outside the Indian Union, the problem can hardly be understood without understanding and transformation of the Hindu role in Punjab. Both the Akalis and the leaders of the Assam movement, as well as the leading elements elsewhere of such mass-movements as 'anti-reservation' agitations, have undoubted mass-base, but are totally detached from radical and democratic ideas. How is the left to understand and combat their conservative outlook without alienating the masses? That remains a major problem.

It is ironical and instructive that left-wing publicists have recently described a 180 degree turn from aesthete-like downgrading of the masses to a Maoist worship. Much is made of the spontaneous creativity of the masses. But even the British *guru* Raymond Williams cannot demonstrate that the co-operative clubs, mutual-aid teams and friendly societies of working-class culture in Britain have been immune to the devitalising viral attacks of middle-class culture. Indeed, while such cultural responses are heart-warming evidence of resistance to capitalist hegemony, they fail to stem the tide of capitalist culture and eventually turn into outposts of capitalist culture in the proletarian hinterland. Raymond Williams does not study (one wishes somebody else would) how British working-class culture, dominated and structured by middle-class radicals without revolutionary ideology, has helped in stabilising and strengthening British *capitalist* rule.

The left parties' scepticism regarding the winds of change are understandable against such a background. But the history of Marxism is sufficient evidence that creative Marxism is by no means a surrender to revisionism in every instance. The risks must be taken, however great they may be.

HIREN GOHAIN

Gauhati.

# Deeper into Agrochemicals

**Hansavivek**

*NATIONAL ORGANIC CHEMICAL INDUSTRIES (NOCIL)* proposes to increase its participation in the agrochemicals business and is seeking government permission to undertake manufacture of Phosphamidon and DDVP. The project is estimated to cost Rs four crore. It has also submitted an application for the manufacture of sulphonates and sulphates of linear alkyl benzene/dodecyl benzene/alpha olefins/fatty alcohols and detergents based thereon at a cost of about Rs 6.4 crore. In addition, the company is considering a number of other possible areas for investment and marketing as a means of achieving growth in the future. After successfully overcoming teething troubles of the monocrotophos plant, experienced in 1983, the company has been able to achieve operation of the plant at design capacity despite repeated power interruptions. The company started commercial production at the cypermethrin plant in September 1984 and it has been operating smoothly. The petrochemicals plant showed a satisfactory performance during 1984, after four rather poor years. This could be possible as a result of the cumulative effect of steady operations with few breakdowns, careful monitoring of utilities and yields, a continuing search for improved efficiency and operating economies and the beneficial impact of investments on modernisation in earlier years. The company achieved a number of production records during the year, the most significant being the production of nearly 72,000 tonnes of ethylene as against the previous high mark of about 63,000 tonnes reached in 1978.

While sales increased from previous year's Rs 156.47 crore to Rs 200.18 crore, gross profit jumped from Rs 10.32 crore to Rs 26.96 crore. Gross margins have been thus doubled. Net profit amounted to Rs 14.02 crore against a mere Rs 2.02 crore, even though provision for depreciation required more and tax liability a crore of rupees against nil previously. Dividend has been stepped up four points to 16 per cent and is covered as much as 3.65 times by earnings, whereas nearly a fourth of last year's lower payment was short-earned. These good results were obtained despite increases in costs. The price of electricity increased by 7.25 paise per unit. The full impact of the increase in water charges by MIDC from Rs 2 to Rs 3 per cubic metre effective from mid-October 1983 was felt during the year. The base price of chlorine increased by about Rs 335 per tonne resulting in an overall rise of about Rs 420 per tonne inclusive of duties/taxes, an increase of 66 per cent over the 1983 price. Recoveries through increases in selling prices to offset these cost increases were made by the company to the limited extent possible. The company had earlier estimated a contingent liability of Rs 26 lakh in respect of income-tax on account of retrospective amendment to Section 80 J of the Income-tax Act. This has been recalculated at Rs 11 lakh after having regard to appellate decisions affecting the tax liability of the company for the relevant years. Provision for the sum

of Rs 11 lakh has been made in the accounts for 1984.

*COLGATE-PALMOLIVE (INDIA)* has once again shown good results and stepped up total dividend by five points to 70 per cent. What is more, the directors have recommended an issue of bonus shares on a one-for-one basis by capitalising 393 lakh out of the general reserve. The issue of bonus shares is subject to the approval of the Controller of Capital Issues and, as regards the issue and allotment to non-residents, also subject to the approval of the RBI. The company's sales amounted to Rs 92.76 crore against Rs 80.88 crore in the previous year, and gross profit Rs 17.34 crore against Rs 15.81 crore. These figures reflect a small shrinkage in gross margins. With increase in tax liability, net profit has turned out to be a shade lower at Rs 3.90 crore compared to previous year's Rs 3.93 crore. The enhanced distribution is covered 1.42 times by earnings as against 1.54 times. The book value of each ten rupee share based on net worth as at the end of the year was Rs 29.88 and the aggregate dividend worked out to 23.4 per cent of this book value. A notable feature of the company's working is that it carries on its business entirely with its own funds. The loan borrowing shown in the Balance Sheet is an unsecured interest-free loan of Rs 42,010 from Colgate-Palmolive Company, USA. In recommending the issue of bonus shares, the directors have recorded their intention to propose a dividend of "not less than 15 per cent" on the expanded paid-up share capital after the issue of bonus shares. Looking to the company's profits and its past dividend record, this appears to be an ultra-conservative indication. R H Hall resigned as a director on March 11 last. No appointment has been made to fill this vacancy.

*OTIS ELEVATOR COMPANY (INDIA)* has well maintained its growth record during 1983-84 and has announced a proposal to make a bonus issue of equity shares on a one-for-one basis besides maintenance of dividend at 25 per cent, to reward the shareholders. The proposed bonus issue will involve capitalisation of Rs 252 lakh out of the general reserve and is subject to the approval of the Controller of Capital Issues and other concerned authorities. Sales and service income of the company amounted to Rs 26.93 crore against Rs 20.79 crore in the previous year and gross profit Rs 6.07 crore against Rs 5.10 crore, showing reduced profit margins because of higher costs of inputs. With both depreciation and tax liability requiring higher provisions, the gap has narrowed and net profit came to Rs 1.90 crore against Rs 1.81 crore. Equity distribution is covered 3.01 times by earnings compared to 2.87 times previously. While the total turnover of the company increased by about 30 per cent over the year, export completions of Rs 1.59 crore were 49 per cent ahead of last year. The directors state that domestic orders booked for elevators and escalators during the year were valued at about Rs 30 crore as compared to Rs 25 crore last year. Growing competition coupled with continuing increases of costs are resulting in lower margins. Export orders received have been lower at Rs 145 lakh as against Rs 177 lakh previously due to increased competition and unremunerative prices. The company's income-tax liability for assessment years 1972-73 to 1975-76 is likely to go up in view of the recent verdict of the Supreme Court in other cases. General reserve number 1, which was established at Rs 68 lakh, has been written back and provisions for taxation for the previous years correspondingly increased.

*RECKITT AND COLMAN OF INDIA* has fared so well during 1984 that the board has not only stepped up dividend by two points to 22 per cent but also recommended issue of bonus shares in the proportion of two equity shares for every five shares held by capitalising Rs 119.88 lakh out of the general reserve. The issue of bonus shares is subject to and conditional upon the consent of the Controller of Capital Issues and of the permission of RBI in so far as it relates to allotment of bonus shares to any person who is not an Indian national or is resident outside India. The company has earned a gross profit of Rs 6.07 crore against Rs 5.19 crore in the previous year following an increase in turnover from Rs 25.92 crore to Rs 28.41 crore, reflecting an appreciable increase in margins. Net profit is also higher at Rs 3.80 crore (Rs 3.42 crore). The enhanced distribution is covered 2.90 times by earnings as against 2.40 times previously. The company's R and D centre has been functioning satisfactorily. Commercial production of some of the processes developed in the laboratory for aromatic chemicals commenced during the year. The company incurred capital expenditure of Rs 115 lakh, of which about Rs 32 lakh accounted for R and D activities.

*GUJARAT STATE FERTILISERS COMPANY (GSFC)*, which hoisted new peaks in 1984—in fertiliser production at 6.42 lakh tonnes, in turnover at Rs 229 crore and in gross profit at Rs 39 crore—is looking ahead to sustained growth in the coming years. Addressing shareholders at the 23rd annual general meeting at Fertilisernagar, near Baroda, the Chairman and Managing Director, Moosa Raza said that the work on the coastal DAP project, being set up at Sikka, had been speeded up with the signing of the contract and commencement of preliminary work at the site. He expressed confidence that the proposed new ammonia plant and the expansion of the caprolactam plant, for which letters of intent were expected shortly, would substantially improve the company's growth prospects. Meanwhile, the company had made a major breakthrough by entering the international market through export of Gujlamine (melamine) to South Korea and Japan. The product is comparable to international standards. The Chairman re-assured shareholders that the company was well geared to meet the expectations of all concerned. He welcomed the pragmatic and imaginative budget proposals and the balanced import-export policy announced by the Government of India. He, however, observed that the decanalisation of caprolactam would adversely affect indigenous caprolactam operations and urged the government to consider this aspect while permitting imports of caprolactam. Raza expressed the company's deep concern for the welfare of the farmers and for rural development, which was reflected in the sustained and increased involvement in promotional and developmental activities, and, said that besides the existing package of services to farmers, the adoption of dry farming projects in selected areas of Gujarat and the development and commercial production of bio-fertilisers as a supplementary low cost input were new dimensions added to GSFC's promotional programme. A large number of shareholders including farmers from different parts of the state attended the meeting. Many of them paid glowing tributes to the company for its excellent all round performance during last year.

*RAJASTHAN STATE INDUSTRIAL DEVELOPMENT AND INVESTMENT CORPORATION (RIICO)* recently organised a special industrial promotion campaign in Bombay to offer vantage location on ideal projects for initiating industries in the 'no-industry' district of Sirohi in Rajasthan. The campaign was quite successful and many entrepreneurs evinced interest in setting up industries in that backward region. According to V B L Mathur, Chairman and Managing Director, both RIICO and Rajasthan Financial Corporation (RFC) have sanctioned about Rs 14 crore to industries set up in the Sirohi district during the past two years. The total number of beneficiaries were around 260 small, medium and large scale industries.

# Time to Play It Cool

**Romesh Thapar**

THERE is something terribly strange about the surprise that is expressed in official quarters when an eruption, terrorist or otherwise, takes place in some part of this rather large and difficult sub-continent. India is so garrulous and open about its prognostications and expectations that almost all possibilities have been discussed in the bazaars before the event.

The transistor-bombs used in the north were certainly a variation, but surely the elaborate and numerous Intelligence agencies were not unaware that the extremists-cum-terrorists would stir as the solutions to Punjab's tangles came on to the national agenda.

It is most encouraging that both the government and the public have played it cool as violence has mounted at widely separate points. Anxiety there must be, what with everyone fighting everyone in Gujarat's capital city, with newly-activised secessionists in the Kashmir Valley screaming, 'Indian dogs go back!', with the Shiv Sena in Bombay attempting to prepare a scenario for the expulsion of non-Maharashtrians from the city, and with the Sikhs in Punjab pussy-footing over the leadership ambitions of persons hiding behind the 83-year old father of Bhindranwale.

This is no ordinary summer of discontent. It is taking on dimensions very much more serious than what we have been accustomed to in the past. Indeed, at this moment of writing, the speculation is widespread whether a number of forces are not pitching in to make the going doubly difficult for the government of Rajiv Gandhi.

What, for example, is the justification for the BJP to call a provocative *bandh* in Delhi when the law-and-order position is under strain following the transistor-bomb attacks in the north? What persuades Opposition formations to urge the banning of organisations that they do not agree with (*a la* L K Advani) or the dismissal of governments newly elected with huge majority (as in Gujarat)? What is the motivation behind the move of Maharashtra's Congress Chief Minister to paly second fiddle to the vicious Shiv Sena campaign for discrimination against non-Marathas? And what thoughts are stirring among those Congressmen who have in private begun lampooning their PM as someone ill-suited to his job and disastrous for the country?

Maybe, the ruling Congress Party is moving into a kind of 1968 situation when Indira Gandhi was being confronted by the so-called Syndicate and had to move skilfully to preserve her position of power. The thrust of those days led to the Congress split of 1969. Can history again repeat itself or will it be possible to keep the dissidents within the ruling party at the level of muttering and murmering? Indira Gandhi, let it be remembered, used government patronage to do this even at the cost of vital efficiencies.

Of course, the ridiculous posturing of the frustrated *dadas* of the party around 'the imperative need for socialism' based on 'an expanding public sector' dedicated to 'the eradication of poverty' is received in the country with the contempt it deserves. The record of the party is too dismal. But Rajiv Gandhi's reluctance to spell out what his alternative programme means in the context of a just and productive society puts him on the defensive and damages him. This was clear at the AICC jamboree in Delhi.

The argument that he does not know what he wants to do is heard at every level. When he takes an intelligent stand on the Akali/SGPC business of pulling down the Akal Takht, there is immediate appreciation. He articulates an unspoken consensus. But, if economic policy-making is always controversial, why is there a failure to end the dangerous 'democratic' farce in Kashmir where elections should be held, and should we not have a spell of President's rule in Gujarat after what the state has been through? Assam, too, needs an immediate opening to proper elections. We are piling up crisis upon crisis.

Punjab, however remains the major challenge with the extremist/terrorist attempt to disrupt any kind of straightforward settlement. History teaches that often it is better governance to avoid negotiations with groups that have no fixed positions and to proceed to intelligent unilateral decision-making. Punjab is in the grip of a variation of criminalised and communalised politics, and must be salvaged in this fashion.

If the planned jail delivery of young activists has become too controversial following the bomb attacks, there is no reason why permanent machinery should not be established to deal with water and border problems which concern a number of states. Permanent commissions, under respected judicial leadership, should be available to decide on these problems. Until an Inter-State Council is agreed upon, the Sarkaria Commission which is concerned with Centre-State relations could also be turned into something more permanent. Then, only the future of Chandigarh would remain to be announced, and here there is not much to be decided.

The bureaucratic and political fear that such steps will be viewed as 'concessions' and will be claimed as 'victories' by the intemperate elements in the Sikh community could be discounted by mandatory regulations which discipline the functioning of *all* places of worship. Such regulations are overdue and would be widely welcomed by those who are deeply disturbed by the manner in which religion is being misused for politicking.

The lack of political initiatives to solve problems is being criticised all over the country. It is a debilitating factor in the present surcharged situation where all the clout is with those who want to strangle the democratic system and bury it. This effort parallels the attempt to keep the country paralysed within the existing economic stagnation. Clear perspectives are absent. Without them, the people cannot be diverted from the nihilism that is taking hold of them.

Why are we so reluctant to correct ourselves, even to re-structure palliatives which have been misread or distorted? The budget needs constant revision if we are to avoid the snares and traps of the economic lobbies, now more active than ever. So, too, stupid legislation like the enactment on urban ceilings, a vast area of evasion and corruption, or the parameters of our textile policy now floundering in confusion, or the reform of the police system already sketched in detail by an experienced commission. Who is blunting action? The bureaucracy? Or are we the victims of those elected to power who lack the courage to begin the surgery?

A fumbling Rajiv Gandhi heading a party with no commitments, an apparently energetic Jyoti Basu sitting pretty on his dying city, a damaged M G Ramachandran still happy to be all things to all factions in his party, an over-confident NTR living with his gods and goddesses and what they say to him, a still confident Solanki when all has failed, a Patil and Pawar in competition over the worst of parochial chauvinisms, an angry Faroukh Abdullah unable to think beyond disruptive *bandhs* which ruin the fragile tourist economy of the Valley and still do not return power to the people, the crazy Akali leaders constantly harping on their community's courageous history but forever surrendering to the threats of terrorist gangs . . . I could go on like this *ad infinitum*. A single R K Hegde does not herald a Spring.

Whatever brought us to this level of political imbecility? Let's play it cool until we find the answer.

*May 17.*

## ANDHRA PRADESH

# Indravelli 1985

**KB**

THE Seventh National Highway, in its run from Hyderabad to Nagpur, leaves the Godavari basin at the commercial town of Nirmal and climbs on to the West-Central highlands of Adilabad by a brisk series of twists and turns picturesquely called Mahbub ghat; and then it has a run of about 50 kms on the plateau before it dips again into the sweltering district headquarters town of Adilabad. If, on the 20th of April this year, you happened to be on this road or in the teak forest flanking it, you would have seen a very odd sight. You would have observed pickets of 4 or 5 reserve constables armed with rifles holding up traffic every now and then and subjecting the passengers of buses, lorries and jeeps to a close scrutiny. They even pull out some people from the buses, and some vehicles are stopped altogether.

The police are on the look out for people going to Indravelli. On any other day of the year Indravelli is so typical of a roadside village in a tribal area—with the tribal hutments consigned to the periphery and the road flanked by the houses of Marathi and Telugu settler landowners, of an odd Revenue or Forest or 'Tribal Development' official, and most prominently the big and ugly houses of the Marwari traders with the unmistakable swastika and the best-of-both-worlds motto *shubblaabh* daubed in simulated turmeric (that is to say yellow paint) on the door-post—that you would have wondered why the police should be interested in people going to Indravelli. But 20th of April is not any other day of the year.

Four years ago that day, on 20th of April 1981, the police fired on a large gathering of tribals organised by the Girijana Rytu Coolie Sangham for a public meeting. The meeting was first permitted and then cancelled at the last minute and Section 144 Cr PC was promulgated; tribals who could not know of the prohibition and who came walking dozens of miles along forest paths were deliberately assualted and fired upon. The exact death toll is a matter of dispute. The government maintains that only 13 persons died, and indeed only 12 names have been identified to date; but the local estimate is much higher, and a fact-finding committee of civil liberties people from Delhi and elsewhere, which included among others (and thereby hangs our tale) Manoranjan Mohanty, Professor of Political Science at Delhi University, gave its estimate as sixty.

Since that year the Sangham has made it a habit to hold a commemoration meeting at Indravelli on that date every year. A memorial monument was built amidst continuous police threats, and confiscation of the building material. On the first anniversary the police went around and so effectively propagated their threat of 'one more Indravelli' that not a single tribal turned up at the commemoration meeting. The second year, when the memorial monument was inaugurated, was better. The police blocked roads, held up buses plying along the route and pulled out anybody who had bought a ticket to Indravelli; as evening came on, they even got the buses cancelled. But the tribals came nevertheless. The third year, the gathering was about 10,000 and was addressed among others by George Fernandes. This steadily increasing success of the commemoration meeting sets half the background to what happened this year.

### Growing Strength of Tribal Movement

The other half is the steadily increasing strength of the tribal movement among the Gonds of Adilabad. The Gonds are a tribe who do not fit the romantic urbanite's notion of an *adivasi*. They dress themselves in the manner of the Maratha peasants who have occupied the lands of which the Gonds have been dispossessed. At festival times they probably put on an exotic appearance but on a normal day it is not possible to catch them in anything other than a dhoti and perhaps a full-sleeved shirt. They speak Gondi, Marathi and a smattering of Telugu and Hindi. Shifting cultivation and mahua—archetypal themes in journalistic discussions of 'tribal problems'—are no longer issues of much moment with them. Shifting cultivation is confined to the hilly slopes deep inside the forest, and the mahua is an occasional tree that stands out in lonely splendour on the deforested plains, splendid by virtue of its closely packed crown and the smell, if you know to recognise it. If you talk to the Gonds today, they are more likely to complain about the small amount the Marwari *seths* of Adilabad pay for the cotton crop. And you will believe their plaint if you visit Adilabad and look at the prosperous Marwaris, and—in the proper season—the heaps of bright white cotton by the roadside, which the people appropriately call 'silver mountains'.

The price of cotton, and land, of course.

Adilabad is a district where the 'village tank', a universal phenomenon and even an institution in the rest of Telengana, is prominently absent. In the typical village of North and West Adilabad, which is the recently deforested area, there are few tanks, few irrigation wells, and no canals, notwithstanding the fact that the district is ringed on three sides by the Godavari and two of its tributaries—the Pranahita and and the Penganga. Agriculture depends almost exclusively on rainfall, which increases the land-hunger further. The tribals have been robbed of the best land by the non-tribals and they are therefore continuously in search of new land. The only way they can get it is to cut down forests. They have always been doing this, ever since the Government of the Nizam of Hyderabad introduced non-tribal settlers into the district and parallelly adopted a forest policy of growing teak. But they have always had to contend with the Forest department, its corrupt officials, and Court cases. The main advantage they have gained with the formation of the Sangham is that their new-found collective strength deters the corrupt officials from their exactions.

The state, naturally, has never liked this. And it has reacted in the only way it knows: by deploying the police and giving them the licence to do what they please. Indravelli of 1981 was the first attack. In March last year there happened an incident that could easily have been one more Indravelli in miniature, and which was widely publicised in the Press. The setting was a bunch of villages—Satnala, Toyaguda, Jamini, Mediguda, Mangurla—a few kms to the east of Adilabad town. Tribals of this area had occupied about 300 acres of forest land, and 65 acres of land illegally retained by an ex-Makhtedar. And the peasants (both tribal and non-tribal) of Toyaguda, Mangurla and Jamini were agitating for proper compensation for the 1,000 acres of land they would lose under an irrigation project on the Satnala stream. The story of this compensation is a good instance of how every welfare measure in our country is used *against* the people. The state pays compensation according to what is called the market value of the land: but since this is a notified area where no transfer of land is permitted, the only market value available is that of many years ago, of the time before the notification. Thus, good cotton growing land worth at least Rs 25,000 per acre was paid compensation of only Rs 5,000.

In the early hours of March 10 the police raided these villages in three vans and nine jeeps, and after indiscriminate lathi charge, rounded up 60 to 70 tribals. As they put them in the vans and reached Satnala on the way back, they were surrounded by a large gathering of tribals who had come from various villages to the weekly fair at Satnala. The police lathi-charged them, fired eight rounds into the air, and compounded their catch by arresting another seventy persons. They were all thrashed mercilessly at Adilabad police station and 52 of them (including two women) were charged with assaulting and attempting to murder the police "while they were scouting the forests for a wanted naxalite". The Court, in its wisdom, refused some of them bail and they had to spend nearly a month at distant Nizamabad district jail before they could obtain bail; the others were given bail with the condition that they should stay at far-off towns like Nirmal and Bhainsa, where they would not get even the daily meals that their friends would get in jail.

Another series of assaults that took place in June-July 1984 again illustrate the cycle of proclaimed welfare and developmental measures turning against the people, and then the police being let loose on the people for harbouring naxalites. In the southern taluka of Khanapur, a major source of supplementary income to the tribals and other poor people is the collection of gum. Now, it is part of the mythology of 'Tribal Development' how the greedy private traders buy such forest produce dirt cheap from the tribals (among the more exotic stories being the exchange of a basket of tamarind for a packet of cigarettes), and how the benign state has rescued the tribals by setting up tribal co-operatives and corporations. Very few people know that these co-operatives actually pay them *less* than the greedy private traders, except that the replacement of barter of cigarettes and salt against forest produce with cash payment makes it look more civilised. The reason is that the private trader regards the forest produce procured by the tribal as the property of the tribal and pays for its value—though he pays much less than the market value. The institutions of the state pay neither the real market value nor the market value less a nominal profit for the state; they do not in the first place regard the forest produce procured by the tribals as their property at all; the forest and all it contains is the property of the state, and all that the tribal gets is a wage for procuring it, which naturally turns out to be much less than the diminished market value paid by the private trader. Speaking of Adilabad, the tribal gets only Rs five to eight per kg of gum from the tribal co-operative, whereas the private traders pay Rs 12. The 'nationalisation' of forest produce is a bigger fraud on the forest-dwellers that the commercialisation of forests that began about a century and a half ago. Its purpose has never been to ensure that the forests provide a decent livelihood to the tribals, but only to take away the forests from the petty marauders and concentrate the wealth in the hands of the state to serve the interest of the principal propertied classes of the country.

The forest-dwellers themselves may not know all this but they do know who pays them more. And so a lot of 'smuggling' takes place, to which the state reacts by setting up police stations and camps and assaulting the tribals. During June-July 1984 there were repeated raids on Dharmajipet, Kadem, Dathojipet, Gangapuram and Allampalli. A large number of people were beaten, arrested and some of them were released upon payment of Rs 200 each to the SI of Khanapur; houses were pulled down, pots and utensils smashed and limbs broken. A police camp was set up for a period at Allampalli and the policemen forcibly took 20 chicken from the people of Allampalli and three goats from the people of Gangapuram.

## 'FREE HAND' FOR POLICE

Since March 1985 things have worsened. To N T Rama Rao, his re-election this year has apparently meant that he can behave without regard to anybody's opinions. He has quickly acted in giving the police the 'free hand' that is their fondest fancy, in dealing with the peasant movement. And this brings us to the odd sight you would have seen if you had been on the Seventh National highway on the 20th of April this year.

The police decided that prohibiting the Indravelli meeting is not the best way of assaulting the tribals. They permitted the meeting, and assaulted the people as they prepared for it. They arrested the organisers, including Ganji Rama Rao, for many years member of the State Assembly before the CPI split. They arrested him at Indravelli three days before the meeting and declared to the Press that he was arrested at far-off Asifabad while extorting donations from traders by threats. They arrested students who were carrying a plaque to be attached to the monument. They drove back tribal groups coming to the meetig by driving jeeps into them. And unlike in the previous year they arrested even the speakers who had come to address the meeting. One of them was Manoranjan Mohanty, for whom this was to be a return visit to Indravelli where he had come with the fact-finding committee four years ago.

The jeep in which he and some others were travelling was stopped at the village of Gudihathnur where the road to Indravelli branches off from the highway. The jeep was stopped by barricading the road with big stones. Their bags were taken out and the contents thrown out. When they protested, they were beaten with fists and proclaimed to be 'under arrest'. The grounds of the arrest was stated to be preventive detention under Sec 151 Cr PC. After they got into the jeep they were further beaten with rifle butts. In this manner they were taken to Adilabad and the eight of them (including the jeep driver, cleaner and a friend of theirs) were thrown into a single lock-up; they were kept there till the next night without being given any food to eat, but were copiously photographed, finger-printed and interrogated. Mohanty repeatedly requested the SI to let him speak to the Superintendent of Police, for he had an air ticket to Delhi the next day where he had to attend a UGC seminar, and therefore had to get back to Hyderabad before the night. It must be presumed that the SI informed the Superintendent of Police but that gentleman was disinclined to oblige.

To their consternation and surprise the arrested persons discovered late the next night that their detention was not preventive as they had been told all along, but they were being charged (the jeep driver, cleaner and all) with having criminally intimidated the villagers of Gudihathnur by threatening to kill them if they did not go Indravelli, and further, for good measure, for having incited them to revolt against the police and proceed to Indravelli. It was with great difficulty that they could get bail next day in the Court of the Munsif Magistrate, Adilabad. The Police Prosecuting Officer pretended to disbelieve Mohanty's claim that he was a Professor at Delhi University, and challenged him to prove it!

A few days later, when some Pressmen asked N T Rama Rao why intellectuals and academics were ill-treated in this manner, he is reported to have replied: "But why should those people encourage such activities?". There is no better epilogue for the shameful episode.

## PRICES

# Seasonal Patterns Persist

(By a Special Correspondent)

PRICE behaviour in 1984-85 generally indicated an easing of inflationary pressure. The rate of price rise at 7.2 per cent was smaller than that of 8.9 per cent recorded in 1983-84. Wholesale prices rose steadily between March and August 1984 by 7.5 per cent compared to 8.0 per cent in the same period of the previous year. This was followed by a seasonal decline which continued upto the end of December 1984. The decrease of 2.2 per cent was more than that of 0.4 per cent in 1983-84. Between end-December 1984 and March 1985 prices once again rose by two per cent, against a smaller rise of 0.5 per cent in the previous year.

The year 1984-85 was the terminal year of the Sixth Plan. The wholesale price index recorded an average annual growth rate of 8.1 per cent during the Sixth Plan period, i e, between end-March 1980 and end-March 1985, which was the second highest price rise registered in any Plan period. The highest growth rate of 12 per cent was recorded in the Fourth Plan when the economy experienced the first 'oil shock'. The price rise in the Sixth Plan was the result of two successive drought years and the second 'oil shock' during 1979-81. Further, throughout the Sixth Plan period, economy experienced a higher expansion of liquidity.

An analysis of the components of the price rise in 1984-85 shows that the increase upto August 1984 and the subsequent decline till December 1984 were influenced by the movement in prices of seasonal commodities. But in the last quarter of the fiscal year (January-March) the main impulses for the price rise came from increase in administered prices of commodities (see Table 2).

Between end-March 1984 and end-August 1984, prices of seasonal commodities, accounting for a weight of about 48 per cent in the general price index, contributed about 76 per cent to the rise, against 82 per cent last year. Commodities responsible for the sharp rise during the period were mainly wage goods and included pulses (15.6 per cent), fruits and vegetables (29.2 per cent), gur (28.9 per cent), edible oils (15.2 per cent) and oilseeds (10.5 per cent). The seasonal decline between end-August and end-December 1984 was led by fruits and vegetables (−25.5 per cent), gur (−18.0 per cent), oilseeds (−4.5 per cent), fibres (−5.3 per cent) and edible oils (−4.4 per cent). In the last quarter of the fiscal year, i e, between end-December 1984 and end-March 1985 items covered by administered price regulations rose by 5.1 per cent and contributed 63 per cent to the rise of 2.0 per cent in the general price level.

The behaviour of cereal prices, especially those of rice, was most noteworthy during the year. Cereals which had gone up by 1.7 per cent between end-March and end-August came down appreciably by 3.5 per cent between end-August and end-December, reflecting the high foodgrain production and a gradual build up of buffer stocks with the government. But in the last quarter of fiscal year 1984-85 cereal prices rose by 2.0 per cent. Changes in freight charges effected in the budget contributed to this to some extent. Between March 16 and March 29 the price increase was almost one per cent.

Prices of pulses, which had been under continuous pressure during the last decade

TABLE 1: TRENDS IN WHOLESALE PRICES IN SIXTH PLAN PERIOD*

| | Weight | 1980-1981 | 1981-1982 | 1982-1983 | 1983-1984 | 1984-1985 |
|---|---|---|---|---|---|---|
| **All Commodities** | 1000.00 | +16.7 | +2.4 | +6.6 | +8.9 | +7.2 |
| **Seasonal commodities** | 481.30 | +20.0 | −3.9 | +8.0 | +13.0 | +5.9 |

| Clothing and bedding | + 8.8 | + 5.0 | + 4.7 |
| Miscellaneous | + 9.2 | +13.1 | + 8.9 |

*Note:* * Data for components available only upto February 1985.

or so because of a sizeable gap between demand and supply, rose by 14.9 per cent in 1984-85. Production of pulses has remained stagnant around nine to 12 million tonnes and in their case domestic availability cannot be augmented through imports.

Prices of oilseeds and edible oils were kept in check throughout the year by import of edible oils. In 1983-84 about 16 lakh tonnes of edible oils were imported. The improved production of groundnut and coconut also helped to keep prices in check. During the year, while oilseeds decreased by 5.8 per cent as compared to an increase of 25.6 per cent in the previous year, edible oils prices recorded a decline of 1.9 per cent as against a rise of 14.5 per cent.

Domestic tea prices increased sharply in 1982-83 (50.3 per cent) and 1983-84 (36.1 per cent), reflecting the sharp rise in international prices, but recorded a decline of 3.8 per cent in 1984-85. Production of tea was around 550 mn kg in 1982, 588 mn kg in 1983, and 644 mn kg in 1984 and is estimated at 655 mn kg in 1985. Exports however rose from 190 mn kg in 1982 to 215 mn kg in 1984. The domestic price was sought to be contained by banning of export of CTC tea and requiring producers to sell a specific quantum through auctions.

Raw jute prices rose steeply by 135.7 per cent in 1984-85 on top of an increase of 41.7 per cent in 1983-84 and 43.9 per cent in 1982-83. This spurt in prices was due to lower production in the face of buoyant demand for jute goods. Import of three lakhs bales of jute in 1984-85 seems to have had no significant impact on prices.

Sugar, khandsari and gur prices have recorded wide fluctuations in recent years following variations in output. Gur prices had declined in 1982-83, but in 1983-84 and 1984-85 they rose by 41.1 per cent and 3.1 per cent, following low sugarcane production. Prices of sugar have been more or less kept stable by judicious release of sugar from the buffer stock supplemented at times by imports.

Administered commodity prices moved up by 9.0 per cent in 1984-85 against a lower rise of 4.4 per cent last year. There were increases in the administered prices of steel items, petroleum products, aluminium and electricity. Steel prices were raised by 23.4 per cent as compared to 5.1 per cent in the previous year. Though crude petroleum prices declined by 1.6 per cent in 1984-85, prices of petroleum products increased by 8.4 per cent as a result of the Budget proposals. Cement prices rose by 13.0 per cent compared to 8.2 per cent in the previous year, mainly because of an increase of Rs 40 per tonne in the retention price and also because of an increase in the basic excise duty. Increase in the statutory prices of aluminium has been responsible for the rise of seven per cent in prices of non-ferrous metals in 1984-85.

The rate of inflation as measured by consumer prices was 5.0 per cent in 1984-85 which was the lowest for any year in the Sixth Plan (see Table 3).

## BHOPAL TRAGEDY

# Failure of Scientific Community

**Padma Prakash**

LIKE a giant sloth the Indian scientific and research community takes time to move and given a choice it would not move at all. What is distressing is that even a disaster of the dimensions of Bhopal which has left thousands of people dead or suffering has not roused it from its typical lassitude and inertia. In keeping with their usual complacency, scientists and doctors spent the first few post-disaster months 'reassuring' people that MIC would not have long-term health effects even while confessing that relevant information on the toxic effects of the gas was inaccessible. Next they plunged into debates about theories and counter-theories and reduced a social catastrophe to a scientific/clinical/medical problem. But even if this had been accomplished successfully, the situation would not have been so bleak As things are, six months after the disaster, precious little has come out of the plush corridors of research.

The March update of the research being conducted under the Indian Council of Medical Research (ICMR) throws hardly any new light on the vast problem of how to treat the variety of symptoms, some of which are only now becoming apparent. The ICMR has already funded over 20 projects totalling Rs 156 lakh. All but two of them are of more than two years' duration. The main objective of the various studies is "to gain knowledge on the delayed, and long-term effects of exposure which would be of value in treatment and in a better outcome eventually". Of the short-term studies one is a follow-up study of 1,000 'affected subjects' over a six-month period. The study began in January. The investigators have found that 74 per cent suffer from cough, 34 per cent from breathlessness and 36 per cent from burning eyes. Anorexia (lack of appetite), lacrimation and fever were also reported. The study also mentions that identified cases will also be provided with treatment, but the summary until March mentions no treatment. These findings are nothing new and corroborate and support the observation and records of other studies such as the KEM-VHAI Bhopal study, S R Kamat's hospital study and the Medico Friends Circle's socio-medical study. More intriguing is the study on ocular changes which concludes that there are no cases of complete blindness and that the majority of the cases have completely recovered with treatment. This is surprising because the KEM-VHAI study reports a high percentage of visual problems in children. At the end of March when the MFC team visited Bhopal to conduct their survey, eye disorders seemed widespread.

The plight of women, especially pregnant women, is pathetic. As early as February it was known that a good proportion of the women were suffering from a variety of gynaecological problems. Several voluntary groups, health groups and women's groups suggested the setting up of regular basti-based clinics for women. But that has been ignored. The KEM-VHAI study has found that 100 out of 198 women surveyed were suffering from gynaecological problems. Such problems are an indication that the gas has indeed affected the reproductive system. This should have been a major concern in research and relief and treatment. But none of the ICMR's projects consider this aspect to be of any importance. Ever since the disaster there have been sporadic reports of increased rates of abortion and still-births among the affected population. A survey conducted by two MFC doctors, Rani Bang and Mira Shiva, had also recorded cases of foetal distress (a decrease in foetal movement). Apparently the doctors at the Zenana Sultania Hospital where a special antenatal clinic for gas-hit victims has been set up are turning away women with false assurances of 'all's well'.

As part of its study of a population of one lakh, the update reports 97 births and 5 still-births. This would suggest a still-birth rate of 50 per 1,000 live births! According to the 1978 figures, the rate in urban India (as reported in the *Sample Registration Bulletin*) was 10.3. In Bombay the figures were closer to 25 to 30 per 1,000 live births. The Bhopal rates appear to be extremely high. Strangely however, in the preliminary report of the ICMR study of teratogenic sequelae no still-births are mentioned. The death of infants in the mother's womb is not an event one can ignore. But that is precisely what the government authorities and the ICMR seem to be trying to do.

It is also surprising that the several research institutions and the two councils of research appear to be pursuing independent programmes of research which is more than likely to be similar. For instance, there does not seem to be any comprehensive plan for research on toxicological aspects between the ICMR funded projects and the CSIR funded Industrial Toxicological Research Centre's (ITRC) interests. This would seem to indicate that the ICMR and the CSIR are as usual going their independent way quite ignoring the urgency of solving the problem at hand or the duplication of costs.

It has been reported that the ICMR met with other institutions in January to work out a strategy for research. One would have expected the setting up of a centralised co-ordination cell for all research work in Bhopal which would perhaps be independent of either council of research. If any understanding or plan of action was formulated at this meeting, the authorities have chosen to keep silent about it.

Another curious turn of affairs is the distribution of responsibility within the ICMR. The department of non-communicable diseases has been designated as the co-ordinating unit for the Bhopal research. The National Institute of Occupational Health (NIOH), an ICMR institution, seems to be nowhere in the picture. Why should a division in the ICMR headquarters be specially strengthened for the purpose when there is already an institute which has both the infrastructure and the expertise for this kind of research? In fact, NIOH seems to be surprisingly absent from the research picture developing in Bhopal.

It is not just the status of *medical* research which arouses ire and distress in Bhopal. Whatever has happened to the numerous samples of water, soil and other materials which were taken from the gas-hit areas for testing? Apart from vague statements about washing vegetables and boiling water and milk, no test results have been published. The KEM report seems to have recorded a high rate of thiocyanate in the water samples from the affected areas. The fact that no definite research-based report on water or soil has been forthcoming even six months after the disaster is disturbing.

In an attempt to combat this embargo on information the Jan Vigyan Samiti co-ordinated by Eklavya, an MP people's science group, was formed in December and their report on the state of the environment was released on the 100th day after the disaster. The 'people's scientists' have had serious problems in getting the samples tested—laboratories have not been willing to release reports or some of the sampling techniques needed have to be innovated, some need sophisticated equipment only available in government laboratories. This preliminary report only makes it all the more urgent for the government institutions to release environmental data and results of tests. For instance, the report states that there are unconfirmed reports of high levels of amines in water. If this is so work needs to be done on how amines behave in the body and if they would have deleterious effect on health. CSIR's silence is only adding to the general confusion.

Never before has the "world's third largest population of scientists" seemed more like a deadweight as now, in the wake of Bhopal.

### INDO-SOVIET RELATIONS

# Economic Diplomacy of the Billion Rouble Credit

**R G Gidadhubli**

MIKHAIL GORBACHEV's one billion rouble (equivalent to Rs 1,160 crore) credit offer to India announced during Rajiv Gandhi's visit to Moscow on May 22, 1985 represents a very shrewd and calculated step by the Soviet leaders ostensibly to promote Indo-Soviet economic co-operation and trade. The Soviet leaders would like to achieve several important objectives by offering this credit.

As in the case of any credit, Gorbachev intends to give a boost to Indo-Soviet trade through the billion rouble credit which is the largest in the history of Indo-Soviet economic co-operation. He might be aware of the viewpoint of a section in India that the level of Indo-Soviet trade had reached a plateau and that the Soviet and Indian economies were no more complementary. But considering the growing interest among Indian exporters in increasing their export volume of traditional and non-traditional commodities to the USSR, this viewpoint may not be valid. However, Soviet policy-makers seem to be convinced that a limit has been reached on their side for exporting oil, oil products, and industrial raw materials. For instance, with a decline, though marginal, in Soviet output in 1984 and in the first four months of 1985, Gorbachev might have indicated to Rajiv Gandhi his country's inability to step up export of oil and oil products beyond the present 3 to 3.5 million tonnes, which constituted about 70 per cent of Soviet exports to India in 1983-84. In contrast to this, the Soviet export of engineering goods to India was only one per cent of their total exports to India. In fact, in the past few years the volume of imports of engineering goods by the USSR from India has been much larger than export of this category of goods to India. Gorbachev wants to correct this situation and also the imbalance in the prevailing export trade structure by offering this huge credit with which India could import Soviet machinery and equipment. Gorbachev intends to achieve simultaneously two objectives, namely, diversification of export trade and growth of trade volume.

Two-way trade between India and the Soviet Union has more than doubled during the last 4-5 years from Rs 1,810 crore in 1979-80 to over Rs 3,840 crore in 1983-84. There are targets of doubling of trade turnover during the period 1986-90 over the achieved level of the previous five-year period. However, there have been wide year-to-year fluctuations in trade and in specific years like 1983 two-way trade declined over the level of the previous year. Among other factors, the shortage of rupee resources was crucial in the Soviet curtailment of imports from India which affected many Indian exporters of traditional and non-traditional commodities to the USSR. While the situation improved in 1984, the shock of 1983 had a psychologically destabilising effect on certain sections of Indian exporters. Soviet policy-makers would have realised that any repetition of such shocks would substantially affect the growth of Indo-Soviet trade, which would not be in the long-term interest of the USSR. Over the last 10-15 years, the Soviets are convinced of India's potentiality and capability for supplying a wide range of traditional and non-traditional goods to the USSR, including engineering goods based on western technology. For several years India had been one of the major trading partners of the USSR among the non-socialist countries. Hence in order to retain the market cultivated so far and to ensure further growth, the Soviet leaders perhaps rightly thought of offering a substantial credit which would automatically be repaid in terms of a variety of consumer and industrial goods to the USSR.

As per the latest agreement, the repayment of the rouble credit together with interest will be, as in the past, in Indian rupees through the sale of Indian goods. In other words, the prevailing framework of Indo-Soviet trade, bilateralism and rupee trade, will be continued at least for the next 15 years. This is precisely what Soviet policy-makers wanted. They did not wish any change in the existing practice. In the opinion of Soviet foreign trade specialists, the bilateral system and avoidance of convertible currency transactions are in the interests of the USSR and India. They further contend that it is mainly due to this arrangement that trade between the two countries has witnessed phenomenal expansion. Soviet policy-makers, therefore, would have been satisfied that the views expressed in certain academic circles in India questioning the utility of the continuation of bilateral rupee trade had not affected the thinking n Rajiv Gandhi's government. The Soviet Union will, therefore, be assured of the supply of substantial quantity of tradiional Indian goods such as tea, coffee, obacco, spices, textile, etc, without paring with its hard currency earnings. While he fact remains that by selling oil and oil products to India, the USSR is forgoing hard currency earnings, Soviet policy-makers have a vested interest in retaining he existing rupee trade system with India. Although foreign exchange forgone by both India and the USSR in mutual trade may be nearly equal, Soviet policy-makers may feel that their sale of defence equipment as well as industrial machinery to India may not be as smooth and secure as under the existing bilateral rupee payment arrangement. Apart from this, the Soviet leaders would like to retain the institution of rupee trade which they have created and built up during the last three decades. They are also aware of the fact that India is the foremost among the not so many developing countries with which bilateral clearing in non-convertible currency is being practised and this system has suited the interest of the USSR and of India.

## SOVIET INTEREST IN INDIA'S PATH OF DEVELOPMENT

Perhaps the most important objective of the Soviet leaders is to test whether Rajiv Gandhi was willing to develop the public sector (referred to in Soviet economic literature as 'state sector') in India. They might have entertained some fears about the future path of India's economic development when Rajiv Gandhi repeatedly criticised the role and performance of public sector undertakings soon after coming to power, even threatening to hand over to the private sector those public sector undertakings which did not function well. The apprehensions of the Soviet leaders might have been reinforced by 'pro-private-sector' budget announced in March 1985. In fact, during my brief visit to Moscow in February 1985 several university professors inquired whether Rajiv Gandhi intended to restrict the growth of the public sector in India. The pronouncements at the recent AICC session about the commitment of the Congress Party to socialism (whatever may be the understanding and content of the term for the Congress Party) and faith in the public sector might have partly allayed the Soviet concern. But the matter was too important for them to be complacent about and to stand by as silent observers. The Soviet Union has its own interest in the growth of India's public sector, representing primarily basic and heavy industries such as power generation, metallurgy, mining, oil exploration, heavy engineering, and so on. Soviet economic assistance to India during the last three decades has been concentrated in these branches of the public sector which, according to the Soviet scholars, has enabled India to achieve economic independence. Soviet leaders do not make any secret of their foreign economic policy objectives with regard to the developing countries which have adopted the policy of developing their state sector. The Soviet leaders consider this as a progressive form of economic development for developing countries and the USSR intends to give preferential treatment to such countries in providing economic assistance.

While it is now for Rajiv Gandhi to make up his mind and to find rupee resources to be able to utilise the rouble credit, the Soviet leaders have assured him of Soviet support for further strengthening India's public sector. The rouble credit, as per the agreement, may be utilised for the Kahelgaon thermal power plant of 840 MW capacity, for opencast mining in Jharia and Singrauli coal fields with washeries and for the establishment of an institute for designing coal washeries, for the petroleum sector in integrated exploration in upper Cambay and Cauvery basins and for modernisation and reconstruction of industrial units in the ferreous metallurgical and machine building sectors.

Ideological and emotional considerations apart, the Soviet billion rouble credit to India has become necessary perhaps for another reason. In spite of nearly two years of expectation on the part of the Soviets, Indian industrialists have not made much progress in purchasing Soviet machinery and engineering goods. There is considerable hesitation and reluctance on the part of even textile manufacturers to take Soviet textile machinery in spite of huge exports of textiles to the USSR and in spite of the prospect of export of 500 million metres indicated by Soviet trading organisations. Besides certain psychological inhibitions about Soviet machinery, there could be hesitation among Indian industrialists about technological suitability of Soviet engineering goods, the productivity of Soviet equipment, easy availability of spare-parts and after-sales service. Since it may take some years to overcome these constraints, Soviet leaders would like to step up export of machinery and equipment to the public sector. And the best way open in the circumstances was to offer a credit for the development of industries in the public sector which is already acquainted with Soviet machinery and equipment.

However, while serving their ideological commitment, Soviet policy-makers perhaps do not wish to neglect India's private sector. An indication of this seems to be conveyed in the agreement in which it is stated that "the terms of the credit agreement are flexible". While it is not made explicit that the rouble credit could be made available to India's private sector, the Soviet government may not be averse to such a proposal since this may help the USSR to sell their machinery and equipment to private sector units from whom they now buy a wide variety of machinery and equipment.

The offer of credit to private sector units may be an incentive to overcome the prejudices and reservations of India's private sector. It is to be seen whether

Soviet trading organisations will succeed in their effort with the engineering industries delegation which was in Moscow during Rajiv Gandhi's visit to the USSR.

### CREDIT UTILISATION

Going by past experience, Gorbachev is aware that India was slow in utilising rouble credits. For instance, the rouble credit equivalent to Rs 116 crore offered on May 12, 1984 is yet to be utilised and the earlier credits made in 1977 and 1980 amounting to Rs 208 crore and Rs 433 crore remain unutilised to the extent of 20 per cent and 90 per cent, respectively. Whatever be the reasons for this state of affairs on the Indian side—lack of rupee resources or inadequate preparation of projects—Soviet policy-makers may have expected that the billion rouble credit, which far exceeds the combined credits made available during the last 10 years, may be utilised only by the middle of 1990s. This suits Gorbachev because the Soviet Union is hard pressed for capital equipment for developing its own oil, engineering and metallurgical industries in the 1986-90 plan period. But the Soviet leaders can immediately start making capital out of the billion rouble credit offer in their propaganda campaign against possible offer of US economic assistance to India when Rajiv Gandhi will visit the US in June 1985.

Gorbachev knows very well Rajiv Gandhi's interest in the West, particularly the US, for hi-tech products which the USSR would not be able to supply. The Soviet leaders might have been worried that starting with hi-tech products on easy terms, the Western countries would consolidate their position in the Indian economy at the expense of the USSR. Hence in order not to loose the ground gained by them in India's economy, the Soviet leaders seemed to have decided to offer a substantial volume of credit to Rajiv Gandhi to strengthen India's heavy industries where Soviet technology does not lag behind that of the West. Thus, out of the one billion rouble credit, 350 million roubles are earmarked for expansion of the oil industry in India and the Soviets have secured the consent of the Government of India for exploration in the potentially prospective areas of Cambay and Cauvery basins. The Soviets have also succeeded in getting Rajiv Gandhi's consent for building a 440 MW atomic power plant in India, their first ever in the non-socialist world, for which they have been waiting for the last two years.

The Soviet leaders' are aware of the benefits to their country of the specific path of development of India's economy as well as of the institutional arrangements evolved for the promotion of Indo-Soviet economic co-operation and trade. Apprehending the prospects of a deviation in India's path of development and modification of the institutional framework of economic relations between the two countries under Rajiv Gandhi's leadership, Gorbachev has decided to vigorously protect the interests of his country with the billion rouble credit.

# Bonn Economic Summit: A Post-Mortem

**Ramesh Jaura**

SINCE the then Chancellor Helmut Schmidt of West Germany and President Giscard D'Estaing of France initiated highest levels consultations among the leaders of major western industrial nations in Rambouillet near Paris in 1975, non-communist economic summits have become an annual feature accompanied by a marathon media show. This, according to co-father Schmidt, has diminished the quality of the summits and their outcome—a view that is obviously not shared by present day sherpas who do the spadework for their respective heads of state or government.

Whatever the veracity of the criticism, the fact is that things have undergone a change in the past decade. The annual economic summits not only serve the purpose of a free exchange of views among leaders with a view to co-ordinating their economic and monetary policies but also involve discussions on current political issues. Precisely that happened at the eleventh annual economic summit in Bonn from May 2 to 4 in which the heads of state or Government of Canada, France, Federal Republic of Germany, Italy, Japan, the UK and the United States participated. The meet was also joined by the EEC Commission president.

The summit concluded not only with a final communique entitled "The Bonn Economic Declaration Towards Sustained Growth and Higher Employment" but also issued on May 3 a "Political Declaration on the 40th Anniversary of the End of Second World War". What is common to both the declarations, according to analysts, is that they do not mention all that the heads of government or state, foreign ministers and economics and finance ministers discussed.

Thus in the Political Declaration, described as an important political document both by Chancellor Kohl and Foreign Minister Genscher, there is no mention of President Ronald Reagan's Strategic Defence Initiative (SDI), popularly known as the Stars Wars plan. Nor does either of the declarations refer to the controversial trade embargo against Nicaragua, the Presidential Directive for which was signed by Reagan soon after landing in West Germany.

Yet, much to the chagrin of the Reagan Administration, there was a serious difference of views among the allies. Among the European allies, France was the most vocal and most unequivocal. President Francois Mitterand must have appeared to himself—as he did to the international public opinion—as an indispensable champion not only of the cause of a sovereign Western Europe but also that of the Third World. He left no doubt that France will not join the SDI research programme. Instead, he wished the other 'big three' of Europe to join the EURECA, a proposal France presented to the Ministerial Meeting of the resuscitated Western European Union (WEU) on 22-23 April in Bonn. The Communique of Foreign and Defence Ministers referred to the French offer when it said: "Noting the increasing importance of technology, the Ministers also affirmed the member states' determination to take the necessary measures within the European Communities to strengthen Europe's own technological capacity and thus achieve the creation of a technological community".

On Nicaragua, President Reagan must have had the feeling of running through a concrete wall. Whereas Canada and Japan did not hide their reservations, the 'big four' of Europe and the EEC Commission President Jacques Delors clearly pointed out that they did not regard trade sanctions as an instrument of policy. Even West German Foreign Hans Dietrich Genscher, known for being extraordinarily cautious, made no bones about the fact that he did not approve of the US move and that the EEC would continue to set forth its policy of establishing closer relations with a large number of Latin American countries with a view to helping the process of democratisation.

### REAGAN'S FAILURE

Another point noted by analysts is that President Reagan failed to return home with support either for his SDI in the Political Declaration or for a calendar for the new GATT Round. This does not mean, however, that the allies have become adamant. It only means that when it comes to national interests, as is the case with France both in respect of SDI and GATT, the allies—in this case only President Mitterand—do not give in that easily.

Apropos the date for launching a new GATT Round, even though France has emerged as the champion of the cause of the Third World—a distinction which Chancellor Kohl also would like to claim for himself, for it was at his behest that the summiteers devoted considerable at-ing countries—the fact is that President Mitterand had to defend the interests of French farmers who fear their existence from a flood of American agricultural exports.

Subsequently, there was no alternative to a painstaking compromise on the issue of GATT. The final communique says: "We strongly endorse the agreement reached by the OECD Ministerial Council that a new GATT Round should begin as soon as possible. Most of us think that this should be in 1986. We agree that it would be useful that a preparatory meeting of senior officials should take place in the GATT before the end of the summer to reach a broad consensus on subject matter and modalities for such negotiations. We also agree that active participation of a significant number of developed and developing countries in such negotiations is essential. We are looking to a balanced package for negotiation."

France had also insisted on a reform of international monetary system and linked it to the launching of a new GATT Round. On this the final communique says: "It is also essential to improve the functioning of the international monetary system. We take note that the Finance Ministers of the Group of Ten, at their meeting in Tokyo in June, intend to complete their current work on ways to improve the functioning of the monetary system and to put forward proposals, to be discussed at the next meeting of the Interim Committee of the International Monetary Fund in Seoul in October, with a view to making the international monetary system more stable and more effective."

In other words, the Bonn Economic Summit rejects an International Monetary Conference, urged by President Mitterand, as well as reiterates its rejection by implication of an International Monetary and Finance Conference desired by the NAM Summit of New Delhi.

### BITTER PILL FOR DEVELOPING COUNTRIES

For the developing countries it means being presented with a *fait accompli*—one that they apparently accepted at the last Interim Committee meeting. It was probably with assurances given there by India and other developing countries at the back of his mind that a senior Cabinet-rank minister in Bonn told a selected group of journalists that India had softened its attitude on the GATT issue. That being the case and the Bonn Economic Declaration being as it is, the developing countries have no alternative to jumping on the bandwagon of a fresh GATT Round—probably in Brussels, as the EEC would like—sometime next year even before the commitments of the Tokyo Round have been fulfilled.

There is a lot more for the developing countries to swallow in the Bonn Economic Declaration. First, they cannot official development assistance (ODA) being maintained or increased as a matter of right. This will be done on a case by case basis. This will apply to debt rescheduling as well. The seven summiteers say that they continue to encourage the constructive dialogue with the developing countries "in the existing international institutions with a view to promoting their economic development and thereby their social and political stability" In the same breath, the communique emphasises the crucial role of, and the improved co-operation between, the International Monetary Fund and the World Bank Group in supporting policies by debtor countries necessary to strengthen the confidence of domestic and foreign creditors and investors, to mobilise domestic savings and to ensure efficient use of resources and sound long-term development.

The communique adds: "We agree to work to ensure that these institutions are equipped with necessary resources and instruments, and we stand ready to discuss an increase in the resources available to the World Bank which may be necessary in the coming years." This is a repetition of known views of the leading donor nations which met in Bonn. In any case, there is no specific mention of IDA replenishment.

The summiteers say they are deeply concerned about the plight of African peoples who are suffering from famine and drought. They welcome the positive response from their citizens and from private organisations, as well as the substantial assistance provided by the governments of many countries and the establishment by the World Bank of the Special Facility for Subsahara Africa. And they will continue to supply emergency food aid.

In addition, the major western donors shall intensify their co-operation with African countries to help them develop their economic potential and a long-term food strategy, based on their own agricultural programmes. They are prepared to promote increases in food production by supplying agricultural inputs within the framework of agricultural development projects. They agree on the need to improve the existing early-warning systems and improve transportation arrangements. However, political obstacles in the countries concerned—which are not named—should not be allowed to stand in the way of the delivery of food to the hungry.

The summiteers also stress the need to examine the establishment of research on dry zone grains, and promise to strengthen co-operation with African countries in fighting against desertification. Further, continued efforts are needed by all countries in a position to contribute to any or all of this work. Finally, the Seven and the EEC Commission call upon the Soviet Union and other communist countries to assume their responsibilities in this regard.

This aid programme for Subsaharan Africa, a brainchild of President Mitterand, is the only substantial outcome of the Bonn Economic Summit as far as economic issues are concerned. In fact, the Seven have set up an expert group to prepare proposals for follow-up measures to be reported to Foreign Ministers by September 1985.

### WAR WOUNDS

Another substantial outcome, falling within the realm of the Political Declaration deserves close attention, especially as Chancellor Kohl, humiliated as a result of being left out of the D-Day celebrations last year, wanted the Summit to take place on the eve of the 40th anniversary of fascist Germany's capitulation and at the same time avail of President Reagan's state visit to achieve reconciliation *a la* Verdun last year with the French President. At the controvesial Bitburg cemetery, where some 50 Waffen SS soldiers are buried, it did not come to a handshake *a la* Verdun. The visit to the former concentration camp Bergen Belsen was added to the itinerary to silence furious criticism in the US. But the ceremony at the Bergen Belsen memorial was boycotted by the Jewish community.

Nevertheless, the Political Declaration itself suffices to satisfy the powers-that-be in West Germany. The first part of the Declaration, of which Chancellor Kohl and Foreign Minister Genscher are certainly proud, says that the seven heads of state or government and the President of the EEC Commission, "meeting together in Bonn on the eve of the fortieth anniversary of the end of Second World War, remember in grief all those who lost their lives in that time, whether by acts of war or as victims of inhumanity, repression and tyranny".

The summiteers acknowledge the duty they owe to their memories, and to all those who follow after them, to uphold peace, freedom and justice "in our countries and in the world". They say they have learned the lessons of history. The end of war marked a new beginning. As the sounds of battle ceased, they had tackled the tasks of moral and spiritual renewal and physical construction. Transcending the hostilities which had once divided them they had initiated on the basis of common values a process for reconciliation and co-operation amongst themselves.

Whether this new step towards reconciliation, black-on-white in the Political Declaration, would heal the wounds which have been reopened, especially as far as the survivors of those who were gassed to death by Nazi megalomaniacs or the victims who survived by chance, are concerned, remains to be seen. It also remains to be seen whether reconciliation in a Political Declaration would lead to reconciliation in the hearts and minds of the people who fought pitched battles against each other only 40 years ago.

# Political Economy of Indian Non-Development

**Ashok Rudra**

**The Political Economy of Development in India** by Pranab Bardhan; Oxford University Press, Delhi, 1985; pp viii + 118, Rs 60.

THIS is a very different book by Pranab Bardhan. As students of economics know for a long time, Bardhan is an economist with one foot in theory and another in empirical research. On the theoretical plane he is further known for his refusal to recognise a Chinese Wall kind of barrier between the analytical tools and concepts of neo-classical economics on one side, and Marxian political economy on the other. In his own words written in the Preface of another book by him that has recently made its appearance, "The book shamelessly uses neo-classical-looking tools to analyse problems of traditional Marxist concern". In his empirical researches on the Indian economy he has been, once again in his own words in the Preface of the present volume, much concerned "with studying different aspects of poverty, measurement of its strength, its socio-economic characterisation and the institutional mechanisms of its perpetuation or reproduction". These empirical researches of his are known by his readers to be marked by a rather touching, uncritical faith (that he shares with many other eminent economists) in the ubiquitous omnipotence of the simple linear regression model for laying bare the hidden causative process in any complex socio-economic problem. All these familiar trappings are missing in the volume under review. No simple mathematical functions; no figures of 't' values and DW statistics, etc, which fill so many pages of his other book released recently.

His concern in the book is one that is shared by most other economists interested in the Indian economy: "The political economy of the constraints that seem to have blocked the economy's escape from a low-level-equilibrium trap of slow growth." In pursuing this concern, he freely crosses the academic boundaries between disciplines like economics, sociology, political science, etc. It is of course easy to appreciate why the subject of his concern cannot be treated within the confines of any one of those disciplines. That is not to say that it is a work with a multi-disciplinary approach, to use a description which has by now become a cliche. It is not an academic work at all but an essay meant for the general intelligent reader. He freely includes whatever mixture of facts and concepts from any of the disciplines is called for by his arguments and writes in a style of discourse which involves 'sweeping survey', 'wanton generalisation' and 'polemical speculations', etc, in an attempt to "taking on a vast panorama of the political economy of development in contemporary India in a few quick, impetuous brush-strokes". Even though he does not state explicitly anywhere, his attempt to "discern some patterns in the chaotic and seemingly disconnected events in the political and economic life of India in recent years" is carried out in a framework of analysis which is clearly Marxian in its fundamentals. As a matter of fact the most important contribution the book makes is a certain class analysis of the Indian society, a certain concept of the role of the State that he advances and a certain kind of class struggle that he describes as leading to the present crisis of Indian society.

Given its highly ambitious coverage, the book is extremely small—a mere eighty pages or so of text supplemented by a number of statistical tables. Half of the text and the statistical tables are used to present a terse but convincing picture of the state of affairs in the Indian economy, whereas the remaining half of the text is devoted to attempts at political economic explanations for that state of affairs. This brevity is explained by the fact that the book is nothing but an expanded version of some lectures that were delivered to an Oxford audience. The tight package in which he presents his facts and figures is highly commendable for its degree of condensation. Alongside certain all too familiar data relating to the Indian economy from standard sources there are some which are less so, e g, the figures relating to the huge subsidies paid by the government with their staggering implications.

His starting point, emphasised at the beginning, is that this crisis can be understood only in terms of a deadlocked contradiction of class interests. He explicitly refuses to search for causes in the "social psyche or national character or value systems" or in the role of the bureaucracy or even in the general fact of India being a case of peripheral capitalism in a world system of global accumulation. All these are recognised as contributing to the crisis but he proposes to trace the particularities of the crisis to some roots which lie in a particular configuration of class conflicts. In this he seems to be almost puritannically attached to his version of the Marxian methodology. He dismisses the possibility of the cause for retardation lying in such factors as the high degree of inequality, rampant corruption or the importance of government interventions in the economy. This he does by pointing out that India is no exception in these matters: there are many other countries with equal or higher degrees of inequality, more pervasive corruption of social life and with at least as much of bureaucratic intervention in the economic life which have known higher rates of growth than India has known.

## STRUCTURAL CHANGES

In two small chapters rapid surveys are made of the achievements and failures of growth of production in agriculture and industry. For both the sectors he adopts a procedure of cutting the thirty-year period from 1950 to 1980 into two equal halves and comparing various rates of growth pertaining to these two periods. He sometimes indulges in carrying out tests of significance of differences among them. This procedure appears to us to be objectionable on various counts. Cutting a period arbitrarily into two can give rise to many spurious statistical results. Of course the mid-sixties are significant in many respects; planning begins not to be taken seriously; extensive agriculture reaches its limits; the period of public sector primacy is over, etc. On the other hand, it is not true that the mid-sixties mark the beginning of the Green Revolution strategy in agriculture. The break point, both in the sequence of policy decisions and in the series of production figures, may be located in 1959, the year the Fort Foundation Team taught "How to Solve India's Food Crisis". In any case, hypotheses about slowing down are not best treated in terms of two constant rates prevailing in two distinct periods: slowing down is a continuous process. And testing the significance of the difference between two such rates for two such periods constitutes an abuse of statistical theory: the estimated rates may not be treated as random variables.

Despite these reservations, we have no hesitation in accepting as valid most of the structural changes he chooses to highlight, e g, deceleration has affected those industries most which started off with extremely high rates of growth (e g, heavy and basic industries, metal and chemical based industries) whereas consumer goods and intermediate goods in general have grown at low rates all along and durable consumer goods have actually accelerated. By presenting such a disaggregated picture the author succeeds in making a convincing case that the deceleration phenomenon cannot be regarded as a direct result of the input substitution strategy playing itself out. He also passes over rapidly the two other pet theories of economists, namely, the 'limited-home-market' theory and that about agricultural development not being sufficient to allow industrial growth. As to the agriculture based explanation, the evidence of agro-based industries not slowing down while the mineral-based industries doing so is persuasive enough. As to the limited home market due to a high degree of inequality we agree with the author that such inequality would affect only the product composition of the final demand but not its rate of growth.

### Decline in Public Investment

The explanation favoured by the author lies in the falling off of public investment. The heart of the economic problem, as understood by the author, lies in insufficient investment in the economy as a whole because of the squandering of public funds, and inefficient utilisation of public investments as well as of other public institutions. All these contribute to the raising of the capital-output ratio in individual industries through extremely low capital utilisation, escalation of costs on items other than fixed assets, etc. The same mismanagement of public funds and public institutions is thought to be responsible for the undoubtedly satisfactory growth performance in agriculture remaining confined only to certain pockets. Positive performance has been recorded, according to him, even in areas where production relations are backward but where public investments have been made in irrigation. It goes without saying that the author does not fail to emphasise the all too common argument of declining public investments entailing declining private investments by creating supply bottlenecks and demand shortages affecting private sector enterprises.

Another important fact emphasised by the author is the following: Gross fixed capital formation in the public sector in 1981-82 was nearly half of the corresponding total of the economy and about five times the amount in the private corporate sector. This investment grew at the rate of 11.3 per cent per year in the first period of fifteen years and in the second half of the thirty-year period the rate dropped to 5.5 per cent per year. This cutback very largely affected such infrastructural sectors as power, fuel and transport services. "The rate of growth of private investment moved in sympathy with that of public investment, although not to the same extent."

Incidentally, the author accepts without any reservations the ups and downs in the rate of savings and the rate of domestic investments as occurring in the official series. As such, he concludes that the rate of public investment reached a peak in the mid-sixties which has never been reached subsequently. Similarly he accepts without any demur the ups and downs in the figure relating to the rate of saving. Here too he accepts that the rate reached maximum of 18 per cent in the mid-sixties that has not been subsequently attained. Those who have taken any trouble about understanding the way our official estimates of savings and investments are prepared, know all too well that these estimates cannot be relied upon to that extent.

However, without paying attention to the detailed movements of the estimates, one can all the same accept the validity of a very severe decline of public investments. Nor need we doubt the comparisons crucial for his political economic analysis, namely that the rise in the capital output ratios, even for the same product, is higher for the public sector than for the private sector and that the situation is worse in the public sector enterprises run by the state governments than in those run by the Central government. Much of all these, the author is convinced, are the results of "political and administrative mismanagement".

### Network of Patronage and Subsidies

For all these familiar dimensions of the retardation phenomenon, the author sets forward an explanation which lies in the domain of politics and where lies whatever claim he may lay to originality. He presents the explanation in terms of a model of the Indian polity which distinguishes itself from the usual Marxist model of the same in two respects, namely the composition of the dominant classes and a certain autonomous nature of the State. The class model that he adopts is one that includes, in addition to the two dominant classes usually recognised in standard Marxian literature on India, namely big industrial capitalist and rich farmers, a third which he at times calls "the professionals in the public sector". As to the State, the author posits that he is talking of a "relative autonomy" of the State which goes much beyond the concept of "the State acting not at the behest of but for all practical purposes on behalf of the dominant proprietary class". We shall have some things to say about these two central planks of his model. But before doing so let us see the facts which he thinks are explained by the model.

The State is required to supply "massive doses of public investment in basic industries and infrastructural facilities" but is prevented from doing so by the frittering away of much of its investable surplus. This happens because the public economy has become "an elaborate network of patronage and subsidies". The author provides a most impressive account of the working of this network. Thus,

(a) Direct subsidies by the Central government on only three items, namely food, fertiliser and exports exceeded Rs 1,500 crore—"a figure which amounts to half of total gross capital formation in manufacturing in the public sector in that year".

(b) The amount of subsidies given by Central and state governments amounted to Rs 3,860 crore in 1982-83.

(c) The losses of public irrigation works amounted to Rs 450 crore in 1981-82; the losses of State Electricity Boards to Rs 600 crore; another Rs 200 crore was lost by the road transport corporations.

(d) The State has been maintaining a white elephant in the form of a vast army of salaried public servants—income accruing to civil and military personnel of the government multiplied nearly seven times between 1950-51 to 1980-81.

(e) "It has been estimated that about half of all demand for recoveries of advances to agriculture by public sector banks has remained overdue for sometime." Overdues to commercial banks were nearly Rs 1,000 crore in June 1982. "The overdues of primary agricultural credit societies amounted to about Rs 900 crore in June 1979."

(f) "Outstanding bank credit to large sick units alone amounted to Rs 1,500 crore by December 1981."

(g) The total expenditure at 1970-71 prices on police including CRP, BSF, CISF, etc, rose by 70 per cent between 1960-61 and 1981-82.

(h) Unaccounted hundreds of crores are eaten up by the MLAs and MPs whom the author characterises as "political middlemen who over the years have specialised in the profession of brokerage services".

(i) Some further reductions in the public funds take place because of the subsidies that have to be given to "some sections of unionised workers, small traders, and some other small propertied interests who take advantage of their large numbers to make their weight felt in the electoral politics of the country.

(j) There is of course the inefficiency of public sector units where political patronage counts more than merit.

"Efficient managers who fail to satisfy the Ministers' political clients are often arbitrarily transferred. Expensive projects are hastily initiated on grounds of political expediency or regional favouritism."

(k) On the side of workers, "over-staffing, feather-bedding, fake pay roles, absenteeism in regular hours and working only for overtime payments".

(l) Then there is sheer pilferage and plundering of public sector goods. "Just between April 1981 and January 1982 two million tons of coal valued at Rs 30 crore where looted from the Asansol-Raniganj coal-belt alone." Percentage losses in transmission and distribution of power exceeded 10 per cent in 1981-82.

This account of corruption and inefficiency is of course all too familiar. The author dismisses the suggestion, favoured by many, that all this is the results of the very existence of the public sector. "The success story of South Korea" he reminds us, "is not one of market liberalism. The Korean state is actively and pervasively interventionist." According to the author, the South Korean success is due to "the ability of the system to largely insulate the framework of economic policy-making from the clientelist demands of the political process".

The question then arises: why has India not been able to achieve that insulation? The author quickly rejects two possible explanations. Insulation does not imply lack of accountability. "In South Korea there is, if anything, excessive accountability of the public enterprise management to the executive leadership." Again, it is not India's having a representative government that is responsible for this state: "Japan manages to have a high degree of such insulation with a liberal democratic government." The author traces the failure of the Indian political leadership to achieve the necessary insulation of the economic decision-making to the nature and function of the Indian democratic system, which is " a subtle and resilient mechanism for conflict management and transactional negotiations among the proprietary classes with all their internal divisions and regional and social diversities". The form the democratic structure has taken in the country "has much to do with the political exigencies of bargaining within its heterogeneous dominant coalition".

### CLASSES AND THE STATE

One has not much difficulty with agreeing with most of this characterisation of the Indian politico-economic system as it functions. However, one is not persuaded that the author has provided any explanations in terms of the model that he puts forward involving three classes and a 'largely autonomous' State. If the frittering away of resources be responsible for the slow rate of growth of the economy, it is not at all clear how the fact of there being more than one ruling class may account for that. The multiplicity might explain a certain sectoral division of investments corresponding to the interests of these ruling classes. It does not explain why funds that could have been invested are spent by way of subsidies. Much of the facts relating to this wastage of investible resources indicates, if anything, the limited extent to which the ruling classes dominate over various other classes and interest groups. Whether the ruling classes number one or two or three does not seem to be relevant for their relative strength *vis-a-vis* non-ruling classes. The State is not shown to be autonomous—if anything it is shown to be highly vulnerable to pressures by all classes and groups, ruling and non-ruling.

We are much in sympathy with the idea that the white collar workers, government officers, business executives and professionals like doctors, engineers, etc, constitute a class of their own, sharing power with the other two ruling classes. The author however, creates confusion by referring to this class in different terms in different places. This class is certainly not confined within the public sector, as the author would hint at times, nor does it derive its power solely by virtue of its "licence giving powers".

The author is equally confusing in his concept of the State. The State is an abstract entity different from the bureaucracy, which carries out State policies by making use of instruments of State power; different also from the leaders of the government, who at any point of time, lay down the State policies; different again from the MLAs and MPs and other politicians who indeed act as brokers between different classes and interest groups on the one side and the bureaucracy and the leaders of the government on the other, for the distribution of patronages. In the author's writing these different actors get mixed up with each other referred to at times as "State elite", at other times as "the leadership", etc.

Finally, the author neither establishes nor makes any use of his idea of the State being much more autonomous than has been usually thought of. He does give plenty of figures for showing the very important weight in the economy carried by public sector investments. But however large the weight, that by itself cannot establish the validity of the theoretical proposition that "the state is today an important part of the economic base itself". As a matter of fact, to appreciate the idea that the state not merely acts *at the behest of* certain classes not only *on behalf of* those classes but as an autonomous "organisational actor", one has to be very clear as to what is meant by the State acting at the behest of or on behalf of or as an autonomous actor. On our part, we understand by the proposition that "class A is a ruling class" or "the State represents the interests of class A" nothing other than the following: "The policies and actions of the government are such as to further, in the long run, the interests of class A."

How exactly the State is made to serve class interests understood in the above sense is a matter about which very little research has been done. It is as well to admit that this is an area of darkness in the Marxian theory of the State. Decisions are taken by Ministers and other politicians. They are implemented by members of the bureaucracy. Of course, these individual actors may enjoy a lot of freedom of action. Yet, if it can be shown that the policies adopted and their implementation have been such as to serve the long-term interests of a certain class or classes, it would be perfectly correct to describe the State as serving those class interests. To talk about the autonomy of the State in such a situation neither adds anything to nor subtracts anything from our understanding of the situation.

It is as well to recognise that Marxists have indulged in a great deal of anthropomorphism with regard to the State. One talks as if the State has a mind and a will, acts like a human agent *autonomously* or *at the behest of* or *on behalf of* certain interests. Whereas the fact is that what are called State actions are nothing but the cumulative results of actions taken by individual human agents from cabinet ministers down to the clerk with respect to whom alone the question of autonomy is pertinent. Forgetting this distinction between the concrete and the abstract gives rise to no little confusion. Bardhan's book regrettably fails to avoid the trap. His main contribution in this respect is to make the reader aware of this problematic.

REVIEW OF MANAGEMENT

# Organisational Functioning in Public Sector

### V Nilakant

**Public Sector Administration: New Perspectives** edited by Alexander Kouzmin; Longman Cheshire, Australia, 1983; pp 329.

IN recent years, research and writing on organisations have tended to focus on the organisation-environment interface. It is, as it were, an acknowledgment of the fact that a rational, goal-directed perspective has so far dominated the literature in the field of organisational behaviour. Researchers and practitioners are now moving into the area of strategic management which has sought to integrate individualist and structuralist perspectives in studying organisations [Tichy 1983; Quinn, 1980]. Pfeffer [1982] has provided a comprehensive review of the existing theories in this area. While most of these writings relate to business enterprises in the American context, there has been a void in literature pertaining non-business enterprises in other social contexts. The present book seeks to fill this gap.

The book is a collection of ten essays on various aspects of administration in the public sector, particularly in the Australian context. The underlying assumption is that existing literature on the phenomenon of administration in the governmental context is based on descriptions and analyses "from overly narrow and selective perspectives".

The book is divided into three parts. Part one contains four essays. These deal with the political-economic context of public sector administration in Australia. The second Part consists of three essays which focus on the individual actor within the political-administrative contexts. The thrid part of the book, containing three essays, focuses both substantively and theoretically on the relationship between technology and organisational control and effectiveness. Thus, the book seeks to combine a variety of perspectives each based on a particular level of analysis. These perspectives are intended for re-examining existing notions, constructs and concepts in alternative frameworks which could aid the understanding of the issues currently confronting the public sector system in Australia.

Stewart Clegg's essay on the 'Politics of Public Sector Administration' constitutes the first chapter of this book. Clegg's central thesis is interesting. Contrary to the pronouncements of supply-side economists and monetarists, Clegg argues that a large, expansive state is a functional to the requirements of a complex modern industrial society. Capitalist economy cannot be simply pruned to 'rational' shape or size. While developing his framework, Clegg draws upon Marxian and Weberian analyses supported by a case study of the Swedish attempt to maintain full employment. Clegg's contribution, in my opinion, is the use of the metaphor of sedimentation from geology to study organisational structures and relationships. According to Clegg:

> Intra-organisationally, different control rules evolve at different times, at different stages of functional complexity. Earlier rules may persist at specific levels in the organisation despite the development of more complex rules at a later date. They may be represented as a superimposed series, layered on top of each other . . . These layers also exist in a dynamic relationship with eath other (p 5).

Unfortunately, Clegg has not developed this construct of sedimentation in a substantive manner. Also, Clegg's arguments in support of his central thesis are laborious and long-winded. While they help to instruct and inform, they do not enlighten the reader.

Chapter two of the book, 'The Political Economy of the State in Australia' by Marian Simms deals with conceptualising the changing contours of public sector and examines the nature of the state in Australia in the context of descriptive and normative writings. The paper is useful as it affords a detailed overview of the current literature on these aspects.

## MYTH OF EFFICIENCY

Chapter three of the book, 'Democracy, Bureaucracy, and Mythology' by Elaine Thompson focuses on democratic myths that serve to legitimise the state. Thompson argues, with clarity, how bureaucracies develop a variety of goals that are detrimental to their performance as a responsive and efficient organisation. Dismissing the notion of bureaucratic efficiency as a myth, Thompson discusses the various factors which contribute to the ineffectivenesss of these organisations. These include "bureaucratic pathologies", design factors which emphasise over-specialisation and over-fragmentation and an aversion to change in the face of rapid technological changes.

Thompson quotes Benveniste to show that these technological changes "create excessive bureaucratic uncertainty which, in turn, results in bureaucratic fear. As the future becomes more uncertain, the bureaucracy becomes more rigid and rule-ridden. It therefore performs less well, and this accelerates the spread of the malaise". Thompson points out that despite these failings, the myth of efficiency is sustained. According to her, hierarchy, the central organising principle of bureaucracy, is not meant for efficiency but for control. Thus, bureaucracies are inherently anti-democratic and oligarchic in nature. In addition, "once the efficiency test is broadened to include the need for innovation and creativity in policy making, the nature of the administrative problem is exposed" (p 64).

Thompson goes on to discuss the transfer of the mythology of Westminster from Britain to Australia which has led to the transformation of democracy into an accountable oligarchy. Discussing the issue of public responsibility, Thompson rather forcefully states:

> So often public servants are judged for promotion not by their policy views but by their ability to perform practical tasks, such as drafting reports, chairing difficult meetings and, above all else, getting documents cleared quickly. The result of this is that centralising tendencies, together with pressures towards organisational conformity and conflict avoidance, are reinforced and give further legitimacy to the doctrine of ministerial responsibility (p 70).

Chapter four is a paper by Ian Thynne on 'Accountability, Responsiveness and Public Service Officials'. Thynne believes that there is a definite responsibility void within the Australian federal system of responsible parliamentary government. Thynne presents two contrasting views on the nature of responsibility and accountability of public servants. One school of thought views public servants as anonymous, apolitical and loyal instruments of ministerial authority. A contrasting view depicts public servants as being shrewd, ruthless and manipulative, self-seeking power-brokers. Thynne has examined the systems of control to which public servants in Australia are subject.

Thynne particularly focuses on accountability and responsiveness of public servants. Discussing the concept of 'management by objectives', Thynne believes that such systems have limited application since "the nature and quality of the performances of individual officers, and even units, are difficult to isolate and assess".

While discussing responsiveness of the bureaucracy, Thynne examines the notion of representative bureaucracy". The concept is based on the assumed link between a bureaucracy's social representativeness and its responsiveness to the community with which it interacts. According to Thynne, two propositions can be advanced:

> The first proposition is that during the course of their rise through the service, individuals from the lower social groups in the community are inclined to lose contact with the less upwardly mobile members of their group of origin and, consciously or unconsciously absorb the values and conform to the standards of behaviour of the new groups into which they move through their career successes. The second, and obviously related proposition is that there is no distinctive role

> in representing particular social groups' interests in the service to be expected of individuals from the same groups who have succeeded to senior service positions (p 97).

Thynne proposes three legislative measures in the Australian context to ensure responsibility and accountability of public servants.

Chapter five of the book is a paper by Paul Harris on 'Individuals in Organisations: The Limits to Obedience'. Harris is concerned with the sensitive question of "how should a public servant respond when asked to do something he or she regards as morally wrong?". Harris differentiates between three types of obligations—role-obligations, rule-obligations and agreement-obligations—and discusses the relations between obligations. Harris suggests that an individual's obligations as an official may conflict with other moral obligations. In this context, he examines the options available to an official who has decided that his or her obligations to the organisations are overriden by other moral considerations. These options are broadly classified into: (a) action aimed at change, and (b) action to preserve personal integrity. Organisational responses to individual action are also discussed.

### GOVERNMENT BUREAUCRACY

Chapter six of the book is perhaps the most relevant for an Indian audience. The paper titled 'Government Bureaucracy: Capacities for Learning and Implementation' by Nitish De is based on a study of five departments of the Government of India conducted during 1975-77. The study employed multiple methods of data collection—questionnaires, interviews and study of records. The questionnaires covered a variety of issues ranging from organisational climate to internal *versus* external control orientation. De concludes:

> On the whole, locational incompatibilities, the limited vision about the mission of the truncated task and the social power distance among functionaries lend support to sub-optimal group processes at work. As such, the shared experiences from group working do not adequately contribute to generate a learning culture (p 136).

Perhaps, more interesting than the questionnaire data are data collected through interviews and a study of files (records). The picture that De paints of the Indian bureaucracy is remarkably close to the situation obtaining in many public sector service and industrial organisations in India. Typically, the senior levels complain about unending pressure of work, are involved in routine decisions, and fail to pay attention to the developmental needs of their subordinates. Their inability to view the work system in its totality contributes to their lack of sensitivity and a lack of innovation. There is either a tendency to blame the subordinates or to pretend that 'everything is working well'.

It is abundantly clear that bureaucrats lack managerial expertise. I was hoping to find concrete suggestions in De's paper about the type of managerial inputs that would contribute to innovation and creativity. De, however, speaks of the tremendous resistence to change and the development of "internal logic of an involuted culture". Clearly, then, managerial will, which is the pre-requisite for change, has to be fostered and developed through political change.

De's paper is thought-provoking in that it raises a number of fundamental issues that are pertinent to both practitioners and academics. His conclusions and analysis of the situation are thoughtful. The issues listed are to be typically found in most organisations. The question remains, however, as to the options that are available for changing these organisations. In my view, De could have instead focused on the 'doer' *versus* 'reviewer' culture that is prevalent in most organisations. A bureaucrat is more comfortable in a 'reviewer' role than in a 'doer' role. Changes in recruitment policies, career planning, appraisal systems and promotional policies may be necessary to convert reviewers into doers.

Chapter seven of the book is a paper by Desley Deacon on 'Women, Bureaucracy and the Dual Labour Market: An Historical Analysis'. Deacon divides the workforce into a strong primary and weak secondary market. Deacon argues that the unionisation of the workforce in the primary market has resulted in exclusion of women from this market and in the delegitimisation of their position in the work place. Deacon presents statistical and historical data to support her contention that such ideologies concerning women's work are prevalent even in the public service.

### POLITICS AND TECHNOLOGY

The eighth chapter is a paper by Richard Dunford on 'Politics and Technology: Unravelling the Connections'. Dunford views the relationship between technology and politics as incestuous. Dunford draws upon the case of introduction of new technology in telecommunication in Australia in 1978, to support his argument that technology is not value-neutral. Some of the issues raised by Dunford are indeed profound and need to be studied intensively:

> Control and efficiency usually co-exist rather than conflict, hence the political centrality of conceptions of efficiency . . . Ultimately, the central issue will often devolve to one of political contestation over the relative significance of efficiency, itself a site of contestation, and the value attached to control by the human agents in a production or administration process over the nature of that process (194).

Perhaps, the best written piece in the book is a paper by Thomas Smith on 'Australia's Nuclear Future' which constitutes the ninth chapter of the book. With remarkable clarity, Smith explores the fundamental issues concerning the introduction and management of atomic power facilities, nuclear weaponry systems and uranium enrichment plants. These issues relate to managerial, regulatory and policy problems. Smith points out that our knowledge about managing such complex, high-risk facilities has not kept pace with the technological sophistication of the production process. Smith has raised a number of fundamental questions regarding the transfer of technology, introduction and management, economics and regulatory aspects of nuclear technology. Even though these pertain to the Australian context, in my opinion, they are equally applicable in the Indian context, particularly in the context of the Bhopal tragedy.

The last chapter is a paper by Kouzmin on 'Centrifugal Organisations: Technology and 'Voice' in Organisational Analysis'. Kouzmin, on the basis of a review of the organisational behaviour literature on technology, concludes that research has tended to overstate convergence among findings and has understated the ideological and reflexive problems involved in theorising. Kouzmin calls for a reconstituted technology variable but provides few clues as to how this could be done. The last section of his paper which seeks to provide an alternative framework could have been more elaborate. Also Kouzmin's style of writing would win him few admirers. In order to be understood, Kouzmin has to be re-read several times.

On the whole, while the book has raised some basic questions about public sector organisations, it does not offer any new radical perspective for change. The core issues of hierarchical structure, control and efficiency have been discussed *ad nauseum* in the literature of organisational behaviour. What is now needed is an alternative model for change. That bureaucracies are hierarchical, value control over efficiency and are non-innovative and resistant to change is too well known to be elaborately discussed once again. The challenge before academics is to offer alternative forms of organising work in effective, humane, efficient and productive ways. However, the contribution of the book in providing some fresh insights into organisational functioning cannot be denied or underestimated.

**Technology transfer — to bring you the best in the world**

Voltas is implementing a programme of technology transfer. The objective is to bring the best of products and processes for the benefit of industry and agriculture. The sophisticated SF 6 circuit breaker which Voltas manufactures in collaboration with Merlin & Gerin of France is a case in point. The Voltas P & H Omega crane made in collaboration with Harnischfeger of the USA, a world leader in crane technology, will help speedy implementation of very large national projects. Volrho is yet another example. Voltas has promoted this Rs. 17 crore enterprise in the core sector to produce agro-chemicals in association with Rhone-Poulenc, the largest chemicals group in France. Technology transfer is a major example of the multi-dimensional activities of Voltas.

Voltas is what it has to be. An extensively diversified business to satisfy the essential needs of society. It believes excellence in performance is an achievable virtue.

# Concentration and Marketpower in Indian Automotive Tyre Industry

Sunil Mani

*Though industrial concentration at the firm and business house levels has been studied, no attempt has so far been made, in the relevant literature, to relate effects of rising concentration to market conduct variables like the pricing behaviour of firms.*

*The purpose of the present paper is to trace the rising concentration in the tyre industry and its resultant effects on the pricing behaviour of firms. The industry which was dominated by MNCs has now come to be dominated by Indian business houses and the recent horizontal and vertical integrations by some of the firms have added a new dimension to the concentration. The government's effort to deconcentrate the industry has been effectively neutralised by these developments.*

## INTRODUCTION

INDUSTRIAL concentration refers to the size distribution of firms that sell a specific product or a group of products. It is usually regarded as a significant dimension of market structure because it is thought to play an important part in determining market power and thence business behaviour and performance.

Industrial concentration is one of those aspects of the Indian manufacturing sector which have received special attention. Interest in the studies of concentration stems from the potential value for competition and anti-monopoly policies. There are basically two lines of research that has taken place in this area. The distinction between the two lies in the unit of reference: for one, it is the controlling unit such as the firm or still higher unit such as the business house; for the other, it is the technical unit such as the plant or factory while in the former there are many studies,[1] in the latter area there is just one study.[2]

In the above literature the focus has been mainly on the level and to a certain extent the determinants of concentration *per se*, at the product/industry/business house/plant levels. In standard micro-economic theory monopoly capitalism is criticised on the ground that increasing industrial concentration leads to unduly low outputs and excessive high prices and profit. So there is a need to examine the relationships between concentration and certain dimensions of market behaviour and performance. Of course a large body of literature exists in the west, quantitatively testing the relationship between concentration and profitability, often, at the inter-industry level.[3] But no attempt has been made to relate the effects of concentration in a specific industry to such dimensions of market conduct or behaviour as pricing behaviour and to various dimensions of performance. Here in this paper we are concerned this aspect, i e, to examine the effects of concentration on one dimension of market conduct, *viz*, the pricing behaviour of the firms in the Indian automotive tyre industry. Our choice of this industry is due to the fact that it is one industry which has been heavily concentrated, and has attracted much public attention in recent times.

The history of the tyre industry begins with the year 1936, when the first tyre plant was established in the country. Thereafter, analytically, one can divide the evolution of the industry into three phases on the basis of concentration in production.

Briefly the first phase is from early 1930s upto early 1960s when there were only two manufacturing firms. This was a period of rather heavy concentration in production. The second phase is from the early 1960s to the mid-1970s when the government licensed more units. This phase also marks the entry of Indian firms into the industry, which led to a drastic reduction in concentration and hence to a certain degree of competition. However after a short time competition gave away to collusion in price fixing and output sharing on the basis of an agreement between the firms. In fact the significance of this phase is that the collusive agreement between the firms was formal or written as opposed to tacit agreements usually found in oligopolistic industries. Finally in the third phase, which commences with the mid-1970s, we see the entry of Indian business houses into tyre manufacturing. With the horizontal and vertical integrations that has become characteristic of this phase, we see that concentration is once again on the increase.

The paper is divided into four sections. In the first section, we describe the genesis of the Indian tyre industry, with a view to providing the basic background against which the industry evolved subsequently. Thereafter in the subsequent three sections, we analyse the three phases. Finally the last or the fifth section deals with the policy implications of the study.

## I

## The Genesis

The Indian rubber goods manufacturing industry is of comparatively recent origin. The end of the first world war marked the beginning of the industry and it was in 1920 that the first rubber plant in the country was established for waterproofing of fabrics. Thereafter a few concerns grew in quick succession in Bengal Presidency and elsewhere. But it was only in the 1930s that the manufacturing of tyres commenced in India. There were many favourable factors which led to this. Broadly they can be classified as general and specific factors.

On the general side, there was the availability of adequate quantities of raw rubber at extremely low prices. This was the result of an International Rubber Regulation Agreement (IRRA) which operated between 1934 and 1942 and of which India was a member. By restricting the export of rubber through quotas, it raised the world price of natural rubber and maintained it at a level considerably above the minimum price obtained hitherto; at the same time as a result of the quota system, a substantial portion of the indigenous production could not be exported and this became available at relatively low prices for internal consumption. Another factor was the availability of cheap labour. Thus these two favourable factors having a direct impact on the cost of production, of rubber products in general, in terms of cheap inputs (raw material and labour) paved the way for the growth of the industry.

Dunlop Rubber Co, was the first to establish a tyre plant in the country;[4] the plant was set up in 1936 at Calcutta. Apart from the above mentioned general factors, there were certain more proximate or specific causes in prompting Dunlop to set up its plant. First and foremost was the stores purchase policy of the Government of India which gave preference to products of domestic manufacturers (including subsidiaries of foreign companies operating in India) made from domestic raw materials.[5] A large proportion of Dunlop's business was done with the government and other public bodies, and so this policy of favouring domestic firms induced Dunlop to set up its plant. Secondly the imposition of revenue tariffs on imported tyres and the cost of freight between the foreign sources of supply and the Indian territory was another factor.[6] Thirdly the growth of nationalist feeling from the early 1920s led to a consideration of ways to strengthen the firm's local identity and specifically the Swadeshi movement prompted the company to consider establishing a local rupee capital company instead of selling its products through an agency.[7] Finally the expanding Indian tyre market and the anticipated moves of a rival company, *viz*, Good Year was still another factor.[8] Thus we see that government-policy and oligopoly-induced factors, go a long way towards explaining the domestic investment by Dunlop. They were soon followed by Firestone Tyre and Rubber Co, a US based MNC, with a plant at Bombay in 1939. This was the genesis of the Indian tyre industry, which as we see, began as one dominated by subsidiaries of MNCs.

In this section we have seen the basic background against which the automotive tyre industry evolved in India. We shall now concentrate on its subsequent evolution. We begin with the first phase—a phase of heavy concentration.

## II

## First Phase, 1936-1960

The phase begins with the year 1936, when Dunlop established its plant. The structure of the industry was such that there was rather heavy concentration in production, namely, in the hands of two manufacturers. In addition there were two more, purely, trading firms, *viz*, Good Year and India Tyre and Rubber Co (ITR).[9] Both these firms were using Dunlop's manufacturing facility. There were many inter-company arrangements between these three firms (i e, between Dunlop, Good Year and India Tyre and Rubber). The arrangements could be described as follows.

Good Year had arrangements with Dunlop in respect of several markets, according to which one of them manufactured tyres and tubes for the other where it had a prominent position. In India the agreement between Dunlop and Good Year was entered into in 1937 whereby tyres and tubes bearing Good Year brand names were manufactured at the Dunlop's plant, the technological specifications and mould being supplied by Good Year, while the capital investment required to provide the basic manufacturing facilities was furnished by Dunlop. The products were charged to Good Year on a cost plus basis, the profit margin being open to revision each year. A similar agreement was entered into by Dunlop with ITR in 1938, the terms of which were similar to the above. These kind of arrangements were a common business reaction to the economic vicissitudes of the 1930s and was found in many industries.

This arrangement conferred two kinds of advantages on Dunlop: first it ensured that its plant worked at its full installed capacity, second it precluded any form of meaningful competition between these three firms.

The concentration in production had its repercussions on tyre prices. This will be evident from the features of the pricing system which prevailed during that period. The main features of the pricing system were that:

(i) Tyres and tubes were sold at the same price throughout the country irrespective of the differences in transport costs from the place of production;

(ii) There was very little price differential between the manufacturers for the same type and size of tyres and tubes; and finally as a corollary of (ii); and

(iii) Competition between different manufactures were being carried out on the basis of quality and service and not of price.

It is quite clear that this system of uniform prices were the natural outcome of the organisation of the industry, which we have just described. The reciprocal agreements between Dunlop, Good Year and ITR precluded any form of price competition between these firms. They, therefore, had to act in unison. Firestone, the other manufacturing firm was also not in a position to engage in any price competition with the other three. In short there was a certain degree of tacit collusion between the firms. This could be explained as follows:

First of all Firestone had already 37 per cent of the market. Any reduction in prices by Firestone with a view to capturing other firms' market would have been of net advantage to Firestone only if they succeeded in securing additional business of sufficient volume to compensate for the reduction in their profit margin. All the firms, however, had large financial resources and were able to offset their losses in one market by gains in another. Consequently price cuts by one firm were likely to be matched by counter price cuts and this would have triggered off a series of price wars which would have proved costly to all of them.

Secondly, at the uniform price, Firestone made more profit than Dunlop since its cost of production was lower than that of the latter. In other words it means that at uniform prices and with a differential cost structure, the size of the profit margin earned by Firestone was higher than that of Dunlop. This will be evident from Table 1 which shows the net profit and the rates of profit to capital employed, for the period 1947 to 1953.

The rate of return of capital employed, in the tyre industry was much above the average obtained for Indian industries. The average percentage rate was only 8.1 in 1949, 8.8 in 1950 and 10.6 in 1951.[10] This shows the extent of profitability in the tyre industry.

Since price competition was ruled out

Table 2: Average Actual Prices Realised vis-a-vis Fair Prices

| Year | Excess ( + ) of Actual Prices Realised over Fair Prices (in Per Cent) |
|---|---|
| 1946 | + 21.79 |
| 1947 | + 18.90 |
| 1948 | + 15.26 |
| 1949 | + 9.28 |
| 1950 | + 7.70 |
| 1951 | + 6.88 |
| 1952 | + 11.24 |
| 1953 | + 8.52 |

Table 1: Net Profit of Dunlop and Firestone: 1947-1953

*(Rs in crore)*

| | Dunlop | | Firestone | |
|---|---|---|---|---|
| | Capital Employed | Net Profit | Capital Employed | Net Profit |
| 1947 | 3.14 | 1.17(35) | 2.29 | 1.22(53) |
| 1948 | 4.13 | 1.77(28) | 2.06 | 1.59(77) |
| 1949 | 4.80 | 1.28(27) | 1.89 | 1.30(69) |
| 1950 | 4.84 | 1.17(24) | 2.05 | 1.30(64) |
| 1951 | 5.71 | 1.40(24) | 2.52 | 1.74(69) |
| 1952 | 6.73 | 1.33(20) | 3.27 | 2.32(71) |
| 1953 | 6.63 | 1.25(19) | 3.54 | 1.68(48) |

*Note:* Figures in brackets indicate percentage of net profit to capital employed.

*Source:* Tariff Commission, Report on the fair prices of Rubber Tyres and Tubes, Bombay, 1955.

on these grounds, the only mechanism by which individual manufacturers could seek to expand their respective market shares was on the basis of competitive claims in regard to quality and after sales service. This resulted in excessive reliance being placed on publicity, personal liaison and service attractions of various sorts leading to a competitive increase in selling and distribution expenses (or what is called post-manufacturing expenses in modern parlance).[11] However since Good Year, ITR and Dunlop used the same manufacturing facility, there is a limit to the extent to which qualitative differences could exist between these producers. Thus the element of competition between firms being rather weak, gave them quite a leverage by which they could collude in price fixation and output sharing. This being the case, at the selling prices fixed by the firms they could earn very high profits.

This excessive profiteering attracted the attention of the government, which therefore asked the Tariff Commission in 1952, to undertake an enquiry into the tyre industry. The terms of reference were: (i) Whether prices charged by the tyre manufacturers between 1946 and 1953 were fair in relation to costs? (ii) What should be the fair prices of tyres and tubes manufactured by existing producers?

The Commission, by adopting Dunlop as the representative unit, determined fair prices for the industry as a whole on a uniform basis. These prices were then compared with the average actual prices realised by each of the firms during the period 1946 to 1953. Table 2 shows the excess of average actual prices realised by all the firms over the fair prices determined by the Commission.

The Commission thus found that the prices were excessive in relation to actual costs, on an average by about 12.5 per cent. This is further corroborated by the overall trading results of Dunlop and Firestone presented in Table 1. It was also found that for comparable types and sizes of tyres, the prices in the country were higher than those which prevailed in both UK and the USA.

Although the profits earned in any period are the net results of costs and prices, the manner in which the profits are utilised in any period can have significant effect on costs and prices in subsequent periods. It should be clear that although the firms earned substantial profits year to year, no effort was made by them to lower their prices in order to reduce their profits to a reasonable level. Instead these excessive profits were frittered away by declaring huge dividends and only a small proportion of it was retained in business. This is illustrated in Table 3.

Table 3 shows that while Dunlop retained 28 per cent of the amount available for distribution, the corresponding percentage for Firestone was only about ten. This low percentage for Firestone was due to the fact that it was a fully owned subsidiary of its US parent firm to whom it therefore remitted the entire dividend.[12] What is more striking is the virtual non-provision for reserves by Firestone inspite of its excessive profits.

It is thus clear that by declaring dividends at high rates, the firms have given away a good part of their earnings which could have been utilised for expansion and modernisation of thier business. Though they have retained a small portion, this might have only facilitated them to effect savings in interest and other elements of cost and thus enlarge their profit margin for the subsequent periods.

TABLE 3: AMOUNT AVAILABLE FOR DISTRIBUTION AND THEIR UTILISATION BY DUNLOP AND FIRESTONE, 1946-1953

*(Rs in lakh)*

| | Dunlop | Firestone |
|---|---|---|
| Amount available for distribution | 1000.46 | 1231.66 |
| Distributed as follows: | | |
| Extra depreciation | 68.39 (6.84) | 33.63 (2.73) |
| Bonus | 94.01 (9.40) | 31.74 (2.58) |
| Interest | 48.20 (4.82) | 4.10 (0.33) |
| Taxation provision | 362.17 (36.20) | 488.11 (39.63) |
| Reserves | 204.50 (20.44) | Nil |
| Dividends | 200.26 (20.02) | 554.94 (45.06) |
| Debenture issue exp | 7.76 (0.78) | Nil |
| Misc adjustments | 4.35 (0.43) | 30.29 (2.46) |
| Closing balance | 10.82 (1.08) | 88.85 (7.21) |
| Total | 1000.46 (100) | 1231.66 (100) |
| Amount retained | 283.71 (28.36) | 122.48 (9.94) |

*Notes:* 1 Figures in brackets indicate percentage of the amount available for distribution.
2 Amount retained includes extra depreciation, reserves and closing balance.

*Source:* Tariff Commission (1955), op cit.

The Commission also found that the tyre companies had received government assistance during the war for various projects, which enabled them to expand their manufacturing activities in certain directions without incurring the full capital cost involved.[13] Inspite of this, no effort was made by the firms to pass on these benefits to the consumers. In short the excess profiteering virtually amounted to siphoning off funds from the national economy.

As regards the second term of reference, *viz,* what should be the fair prices of tyres and tubes, the Commission by adopting the cost of production of Dunlop for the period April-June 1955, recommended a fair price. This was on an average, 11 per cent less than the actual prices which prevailed during that period. They also recommended a formula for price escalation to cover a rise in cost of production. Its report which was submitted in 1955 was accepted by the government. The prices fixed as per formula were to last till 1957. But they remained in force till 1963.

However the more significant recommendations of the Commission were the measures to deconcentrate the industry and thereby increasing the degree of competition in the market. For this it suggested two options before the government: first to explore the possibility of securing imports of tyres and tubes with a view to providing some measure of competition and; secondly to offer special assistance to Indian firms willing to enter this market, either independently or in collaboration with foreign enterprises. The government favoured the latter one as it was found to be a feasible and long term solution to the problem.

In view of the expanding market, the government allowed the existing firms to expand. However only Dunlop seized this opportunity by substantially expanding its Shahaganj plant and also by setting up a new second plant at Ambattur (Madras) in 1959. The desire to retain its market power might have prompted Dunlop to take this decision especially when seen with the proposed move of the government to expand the industry by inducting in more firms. The entry of these new firms, leads us to the second phase in the history of the industry.

## III

## Second Phase, 1960-1974

The commencement of this phase roughly corresponds to the beginning of

# SELF-RELIANCE
## IN STEEL PLANT ENGINEERING AND TECHNOLOGY

**Pioneer in steel plant consultancy in India**, DASTURCO has been closely involved in the planning, design and engineering of steel and allied projects for both the public and private sectors. It is consultant to several foreign governments, UNCTAD, UNIDO, World Bank and other international agencies.

### Integrated Steel Plants
For Visakhapatnam Steel Project—India's first coast-based steel plant—DASTURCO as the Principal Consultant is providing comprehensive design and engineering services. DASTURCO is also engineering consultant for ☐ Modernisation of TISCO, Jamshedpur ☐ Silicon Steel Project, Rourkela Steel Plant.

### Alloy and Special Steels
DASTURCO is the consultant to ☐ Alloy Steels Plant, Durgapur (initial plant as well as expansion) ☐ the Special Steels Plant, Salem ☐ Firth Sterling Steel, Nagpur etc.

*TISCO modernisation : Charging molten metal into the 130-ton LD convertor*

### Mini Steel Plants
India's first modern mini steel plant with advanced S-type curved mould continuous casting for Mukand Steel at Thane, Bombay was designed by DASTURCO as far back as 1959. Since then, DASTURCO has engineered a large number of mini steel plants in India and other countries ☐ Steel Complex, Feroke, Kerala ☐ Krishna Steel, Bombay ☐ Oswal Steel, Faridabad ☐ PT Badja Indonesia Utama, Jakarta etc.

### Sponge Iron Plants
For SIIL's sponge iron plant, Kothagudem—India's first DR plant based on non-coking coals—DASTURCO has provided comprehensive design and engineering services.

Now, it is consultant to the Governments of Gujarat and Maharashtra for their two gas-based sponge iron plants.

### Superalloys
Midhani's Superalloys Plant, Hyderabad—one of the most sophisticated and complex metallurgical plants in the world—was designed and engineered by DASTURCO.

### Export of Know-how
As in India, DASTURCO is actively assisting steel development in the Arab world, South-East Asia, Africa and Latin America. Among the numerous assignments handled, the largest and most prestigious is the Misurata Iron and Steel Complex, Libya, now under construction, for which DASTURCO is the Principal Consultant. Currently, DASTURCO is also the Project Consultant for the Trengganu Direct Reduction/Electric Arc Furnace steel plant of HICOM, Malaysia. In Venezuela, DASTURCO provided design/engineering services for SIDOR plant expansion.

DASTURCO is the consultant to the Government of Oman for their first integrated steel plant (DR/EAF) and rolling mill. In Egypt, DASTURCO recently prepared a Master Plan for the development of the steel sector up to 2000 AD. And now, for the Government of Mongolia, DASTURCO is drawing up detailed plans for the establishment of the steel industry in the Republic.

the Third Five-Year Plan. The target for tyres for the plan period was fixed at three million.[14] And subsequently five new units were licensed. Of this Good Year and Ceat were subsidiaries of foreign MNCs and the remaining three (Premier, MRF and Inchek) were Indian companies with foreign technical collaboration, though MRF had a minority equity participation by its foreign collaborator. We will now explain the manner in which these units came about.

Though the target for the Third Plan was fixed at three million, for reasons best known to it, the Commission originally recommended only a capacity of 2.2 million tyres. And the view was that this could be taken care of by the existing firms, *viz*, Dunlop and Firestone, and the three new units that had already been licensed—Premier, Ceat and Good Year. Later on the Commission revised its estimates upwards by 0.60 million to 2.8 million. As a result two more new licences had been issued to Madras Rubber Factory[15] and to General Tyres (whose name was later changed to Inchek Tyres). However in view of the continued demand for tyres, the two established firms (Dunlop and Firestone) made a new representation to the government, conceding the probability of considerable improvement in the demand for tyres and therefore recommending a target of four million tyres for the Third Plan period. The government welcomed this appraoch and agreed with their view and expansion licences were issued to Dunlop and Firestone[16]—a clear violation in spirit of the Tariff Commission's recommendations.

TABLE 4: FEATURES OF THE NEW TYRE UNITS

| Sl No | Name of Company | Form of Management | Technical Collaborator | Location of the Plant |
|---|---|---|---|---|
| 1 | Good Year | Public limited company with majority participation by Good Year Tyre and Rubber Co, USA | Good Year Tyre and Rubber Co, USA | Ballabgarh, Haryana |
| 2 | Ceat | Public limited company with majority participation by Ceat Gomma SPA of Italy | Ceat International S S Laussane Switzerland[1] | Bhandup/Bombay, Maharashtra |
| 3 | MRF[2] | Public limited company with majority participation by the Mammen Mappilai Group and minority equity participation by the technical collaborator | Mansfield Tyre and Rubber Co, USA | Thiruvottiyur/Madras Tamil Nadu |
| 4 | Premier | Public limited company with majority participation by C S Desai[3] | US Rubber Co (Uniroyal) | Kalamassery/ Ernakulam, Kerala |
| 5 | Inchek | Public limited company with majority participation by K N Mookerjee | Techno Export Foreign Trade Co, Czechoslovakia | Kankinara/Calcutta West Bengal. |

*Notes:* 1 Ceat International SA Switzerland is a wholly owned subsidiary of Ceat Gomma SPA Itlay and the former is in charge of the technical collaboration of the latters' overseas plants. Under an agreement, the American manufacturer, General Tyre and Rubber Co agreed to make their technical improvements available to Ceat Gomma SPA which in turn makes these improvements available to the company (i e, Ceat India). It may also be mentioned that the house of Tatas did have a small shareholding in Ceat Tyres (A Second Tier concern).

2 Madras Rubber Factory was already engaged in the production of Cambel back or tread rubber, used in retreading tyres.

3 The licence for Premier Tyres was initially obtained by a Kerala based banker named K P Mathew. However due to financial difficulties it had to be passed over to C S Desai—a Bombay based stock broker who along with the Kerala state government (the state government holds about 33 per cent of the paid-up capital of the company) implemented the project.

The capacities though sanctioned after licensing the four units mentioned earlier, could be implemented by the existing producers and one of the new ones, *viz*, Good Year, by the time the other four new units went on stream in view of the formers' command over financial and technical resources. As a result of all these expansions and the new units going into commercial production, there was a temporary glut in the tyre market during the period 1963 to 1967. Consequently the new Indian units and Ceat Tyres passed through enormous difficulties, their capacity utilisation being only about 30 per cent.[17] The consumers preference was for Dunlop, Firestone and Good Year, names which had been well established in the Indian market for over quarter of a century.[18] As a result the profitability of these new firms suffered immensely.

Table 4 illustrates the features of these new units. In view of their higher initial capital investments and consequent higher interest and depreciation charges, the new units requested the government to sanction some excise duty concessions.[19] However the government sanctioned only a token reduction, working out to about Rs 4 to 5 lakh per year. With these gentle proddings in new units were able to stand on their on by 1967.

In 1968, as a result of the increased production of vehicles and the consequent spurt in demand for tyres, the tyre market underwent a major change. The temporary glut was reversed to a situation of marginal shortage which finally resulted in the emergence of a sort of seller's market. These conditions prompted the manufacturers to reconsider their independent positions on price and output decisions. Specifically this meant whether or not to act in collusion to arrive at a consensus on these decision variables, instead of competing with each other. The new firms, being not yet well established in the market thought it more prudent on their part to join hands with the established manufacturers. All the available qualitative evidence suggests that Dunlop, which was the oldest and the largest firm, took the lead to form a cartel of the existing producers.[20]

In this context it is important to digress a bit into the theoretical explanations for this kind of collusive behaviour as opposed to other options available to the manufacturers. One way of avoiding the uncertainty arising from oligopolistic interdependence is to enter into collusive agreements. There are two main types of collusion, cartels and price leadership. Both forms generally imply formal (written) or tacit (secret) agreements. However open collusive action is commonly illegal in most countries at present. Successful collusion encourages oligopolistic co-ordination by strengthening the participants financially. Once most firms in the industry have gained sufficient financial strength, price wars and vigorous competition offer few rewards. Higher returns can be obtained by formal or tacit co-operation.

The variety of collusive pricing arrangements in industry is limited only by the bounds of human ingenuity. Some are casual and short lived, e g, the spontaneous meetings called to terminate price wars. Others endure for years held together by an elaborate organisational web and binding written contracts.

The Indian tyre industry consisting of eight firms (including ITR which continued as a purely trading firm using Dunlop's manufacturing facility) during the post-1967 period, can quite justifiably be characterised as a cartel with formal or written collusion. We will substantiate this below.

As a result of the changed market conditions and specifically those emanating from the seller's market which had emerged by that time, the tyre manufacturers, who were hitherto acting on their own, decided to cartelise. In order to facilitate co-ordination among themselves, they jointly gave rise to an elaborate written agreement, prescribing clearly a code of conduct to be followed in matters of mutual interest. This agreement was known as, "The General Code of Conduct for Members of the Automotive Tyre Industry of India". This comprehensive agreement touched upon the following issues: (1) price fixing in concert; (2) limiting, restricting or withholding output or supply in a mutually agreed manner; (3) restricting persons or classes of persons to whom tyres are sold; (4) resorting to an agreed distribution system and restricting appointment of dealers of one's own choice by the member tyre manufacturer; (5) collective agreements relating to terms or conditions of sale other than pricing, like credit policy, mode of transport, method and place of advertisement, etc; and (6) allocation of area or market for the disposal of tyres.

TABLE 5: EXPANSION IN INSTALLED CAPACITIES IN 1969

*(In lakh Nos)*

| Name of Company | Existing Installed Capacity | Expansion Licensed | Total |
|---|---|---|---|
| 1 Dunlop | NA | 2.50 | — |
| 2 Ceat | 4.00 | 2.50 | 6.50 |
| 3 MRF | 3.60 | 2.50 | 6.10 |
| 4 Inchek | 3.00 | 3.00 | 6.00 |

*Source:* Shetty, H P, "Tyre Industry of India", Polymer Publications, Bombay, 1976.

It would not thus be an overstatement to believe that the code of conduct was made as elaborate as perhaps "human ingenuity can devise". An examination of the code of conduct shows that it tended to bring about manipulation of prices, and affected the distribution of tyres in the market. Briefly through the code, the tyre manufacturers had completely eliminated competition among themselves. Thus though with the licensing of new units, the concentration in the industry had come down, these collusive practices effectively nullified any benefit that would have accrued to the consumer as a result of the increase in the number of units.

In view of the shortage of tyres, the government decided to lift the industry out of the "Banned List"[21] and allowed the existing manufacturers to substantially expand their existing installed capacity. Excepting for Firestone, Good Year and Premier, all the rest seized the opportunity to substantially expand their capacity.[22] Table 5 gives an indication of this expansion.

As before, once these expansions were fully implemented by the existing firms, the government further decided to issue something like 14 letters of intent. As many as five of these were taken by State Industrial Development Corporations and hitherto they have remained unimplemented. Of the remaining 9, one was issued to Premier Tyres—an existing firm. Among the rest Modi Industries, JK Industries, Ruby Rubber Works and South India Export Co Pvt Ltd have converted them into licences subsequently and have gone into commercial production, on varying dates, since the mid-1970s. Nothing much is known about the remaining four, which were taken by either individual entrepreneurs or existing private corporate companies.[23]

TABLE 6: TRENDS IN LICENSED AND INSTALLED CAPACITY

*(In lakh Nos)*

| | 1971 | | 1972 | | 1973 | | 1978 | |
|---|---|---|---|---|---|---|---|---|

| Inchek | 9.00 | 5.50 | 9.00 | 5.50 | 9.00 | 5.50 | 9.00 | 5.50 |

*Notes:* 1 L = Licensed; I = Installed.

2 In 1973, the MRF was issued a licence for 3.90 lakh tyres plus a fresh licence to the tune of 4 lakh tyres and tubes per annum for setting up a new plant at Goa.

The expansion by the existing units did not make any perceptible impact upon the supply position in the market as a result of the code of conduct which was being pursued vigorously by the existing firms. It may be quite reasonable to speculate that through this expansion the existing firms not only capitalised on the ever rising demand for tyres, but also successfully preempted the recepients of the letters of intent from entering the tyre market by creating an impression of glut if the latter too entered the market.

However this did not proceed without interruption. In December 1971, the Registrar of Restrictive Trade Agreement (RRTA), of the then newly formed MRTPC instituted an inquiry into this alleged cartelisation by the tyre companies. Incidentally this was the first enquiry conducted by the MRTPC since it was formed. The Commission commenced its enquiries in 1972.

Though between 1968 and 1973, the manufacturers were not allowed to increase prices, the 'Code of Conduct' helped them to bring about manipulation of prices and conditions of delivery. In November 1973, however, they announced a joint price hike on grounds of increases in cost of production. However the government reacted sharply and imposed statutory control on prices (for the first time since 1963, when prices were decontrolled consequent to the improved supply position) and compelled the industry to revert to pre-November 1968 prices.

But in 1974 the government once again decided to decontrol the prices. The reason for this change in policy was stated thus: "The difficulties of enforcing price control on the end-product at a time when the prices and availability of essential raw materials for that product were fluctuating, are well known. Under these circumstances, the government have decided that formal price control imposed in November 1973 on certain categories of tyres and tubes should be withdrawn and conditions created for augmenting production rather than refixing prices now and revising them further at short intervals in response to the raw-material prices."[24]

The 'conditions for augmenting production' reflected itself in terms allowing the existing manufacturers, to further expand their capacity. All the units were also allowed to exceed their respective licensed capacities by 25 per cent in case they have the extra built in capacity or if the same can be achieved by the installation of balancing equipments. Table 6 gives trends in licensed and installed capacities for the period 1971 to 1974.

In short the government's effort to increase the installed capacity was, by and large, taken advantage of by the existing producers themselves. This helped them to continue their collusive practices, though quite tacitly, in view of the ongoing MRTPC enquiry.[25]

In 1975, the cartel received a severe jolt in the form of one of the recepients of the letters of intent, M/s Modi Industries Ltd, converting it into a licence and deciding to enter the market. The entry of the Modis, the first Indian business house to enter the tyre industry has completely altered the working of the industry and with this we enter the third and the latest phase in the evolution of the industry.

## IV

## Third Phase, 1975-1984

The characteristic features of this phase are the entry of Indian business houses into tyre manufacturing and the resultant competitive struggle in the industry and the vertical and horizontal integrations which have shown itself in rising concentration. Simultaneously we also see the exit of important MNCs like Firestone, Ceat and, of late Dunlop. The industry is undergoing a succession of changes, all having their impact on the pattern of competition within the industry and also affecting the market power of certain firms.

The Modis started their commercial activities in late 1974. Within a period of two years or so, i e, by 1977, they were able to achieve a significant share of the market, and became a strong force to be reckoned with. Being a new entrant, the Modis found that it was not in their interest to join the cartel.[26] Many reasons could be attributed to this. First of all the existing cartel had uniform distribution and pricing policies and therefore joining the cartel would mean being subservient to the interests of the cartel. The Modis had, therefore, to develop their own independent and effective sales network, since the existing dealers were threatened with black listing if they sold Modi tyres. Consequently a large proportion of their dealers were totally new to the business; older dealers who were dissatisfied with the cartel in which certain dealers were given preferential treatment, also joined them. Secondly given the dominance of cartel, there was a perennial shortage of tyres in the market, since production was also restricted to ensure higher unit value realisation. Thus the consumer had no choice and had to purchase all brands of tyres at virtually the same price and the general quality of tyres available in the market was extremely bad. Nevertheless because of the artificial shortages, tyres and especially truck tyres were sold at a premium. As stated earlier, one of the provisions of the 'code of conduct' was that the market was parcelled out among the members of the cartel. By mutual agreement the market share in each state for each type of tyre was predetermined and the dealers directed accordingly. Hence there was absolutely no competition between the firms and therefore not much of enthusiasm was shown by them in giving effect to the important technological changes that have been taking place in tyre design and manufacture and specifically in the introduction of nylon tyres.[27]

Sensing the mood of the market, the Modis came out with a product which was technologically superior coupled with an independent and effective sales network. So it was not difficult for them to make inroads into the market. The impressive rise of the Modis is also sometimes attributed to their taking full advantage of the various concessions/reliefs extended by the Central and state governments and streamlining of their operations for achieving higher production, etc.

Like the new Indian tyre firms in the second phase, the Modis too requested the government to sanction excise duty concessions on the plea of heavier capital cost and consequent incidence of interest and depreciation charges. But unlike the

TABLE 8: MARKET SHARES OF THE VARIOUS GOENKA UNITS

| Industry | No of Goenka Units | Percentage Market Share |
|---|---|---|
| 1 Automotive tyres | 2 | 35 |
| 2 Carbon black | 3 | 60 |
| 3 Nylon tyrecord | 1 | 24 |
| 4 Rubber chemicals | 1 | 46 |
| 5 Bead wire | 1 | 90 |
| 6 Tube valves | 1 | 90 |
| 7 Rubber machinery | 2 | NA |

*Note:* Market share is defined as the share in total industry production.

TABLE 7: INPUT MANUFACTURING UNITS UNDER GOENKA HOUSE

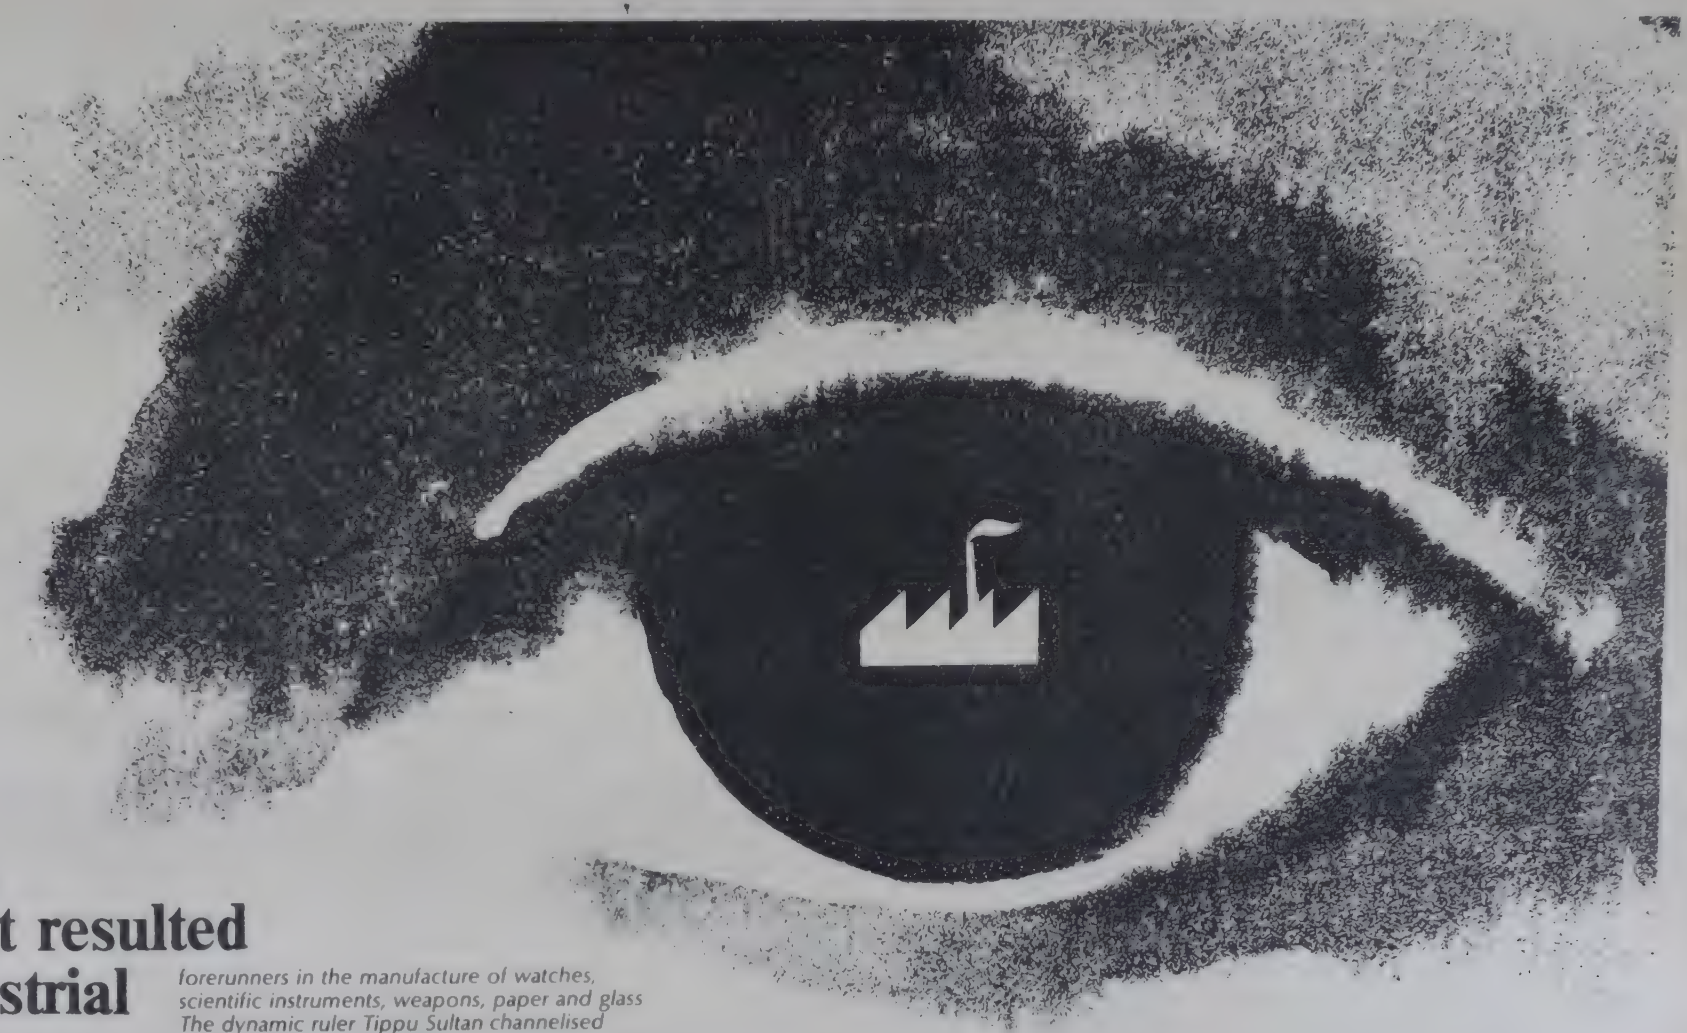
| Sl No | Year of Promotion Take Over[1] | Name of Unit | Product | Capacity Statistics (In '000 tonnes) | |
|---|---|---|---|---|---|
| | | | | Licensed | Installed |
| 1 | 1960 | Phillips Carbon Black | Carbon black | 36 | 36 |
| 2 | 1961 | Schrader-Scovill Duncon | Tyre tube valves | 12.8 | 12.8 |
| 3 | 1962 | National Standard Duncan[2] | Bead wire<br>Tyre moulds | 9.2<br>100 Nos | 9.2<br>100 Nos |
| 4 | 1978 | Oriental Carbon Black | Carbon black | 28 | 28 |
| 5 | 1979 | Gujarat Carbon | Carbon black | 20 | 25 |
| 6 | 1983 | National Rayon Corporation | Nylon tyrecord | 5 | 5 |
| 7 | 1984 | Alfred Herbert (India) | Tyre machinery | | |
| 8 | 1985 | Bayer (India)[3] | Rubber chemicals | 10.3 | 7.8 |

*Notes:* 1 Nos 1 through 5 were promoted by the Goenkas and 6 through 8 were acquired by them through take overs.

2 NSD has received government approval for a new plant for bead wire manufacture and another for manufacture of rubber machinery. The company's application for licence to manufacture steel tyrecord (with an installed capacity of 3,000 tpa) was recommended for grant of licence by the MRTPC and the letter of intent is awaited.

3 Bayer AG, Western Germany still holds about 51 per cent of the equity of Bayer (India).

4 Goenkas also hold about 1875 shares in Harrisons Malayalam—Cochin based largest natural rubber plantation in the corporate sector.



# Karnataka. Where foresight resulted in an Industrial Revolution

Karnataka's industrial heritage dates back to its colourful history. Canals, built during the Vijayanagar Kingdom at Hampi, even today form part of the Tungabhadra Irrigation Project proving that feats of engineering skill are very much part of Karnataka's heritage.

Tippu Sultan later moulded Karnataka's growth with his innovative concept of State-supported industry. Sir M Visvesvaraya, the genius of Karnataka, turned Tippu Sultan's Hydro Electric Project into a reality—the first of its kind in Asia. This magnificent impetus saw the emergence of Karnataka as an industrial trend setter and a force to be reckoned with. Karnataka, blessed with rich natural resources, has many firsts to its credit, being: forerunners in the manufacture of watches, scientific instruments, weapons, paper and glass The dynamic ruler Tippu Sultan channelised the State's overseas trading enterprise and also laid the foundations of sericulture that has today brought Karnataka to the forefront in this agro-based industry. From as far back as 1780, these industries set up with state support have been part and parcel of Karnataka's everyday life.

In 1930, Sir M Visvesvaraya set up the country's first Directorate of Industries and made a bold pioneering effort into steel that is today Visvesvaraya Iron & Steel Limited. This was possible because, the then Maharajas of Mysore shared his enthusiasm and patronised his efforts.

400 large and medium size industries and over 44,000 small scale units with a total investment of Rs 11,220 crores and a disciplined labour force of over 800,000 comprise our state, throbbing with industry.

Karnataka is proud of what it is today. Thanks to great people, great minds and great visionaries whose foresight promised us a bright future.

Karnataka—
continuing a tradition of industry

MCA DIC 5

earlier attitude of the government, when only a token concession was sanctioned, this time they announced an attractive scheme of excise duty relief.[28] This gesture by the government vastly helped the Modis in pricing their products on par with the established companies; while at the same time it brings out the preferential treatment given to units belonging to business houses *vis-a-vis* those of individual entrepreneurs.

It is also surprising that the Modis, who had a licensed capacity of just 4 lakh tyres and tubes (and an installed capacity of 4.55 lakh)—which worked to just about six per cent of the total industry capacity, could achieve a significant share of the market by 1978. This was mainly due to their very high capacity utilisation, touching almost 80 per cent in the first year of operation and thereafter in excess of installed capacity by about 40 to 60 per cent. They (the Modis) attributed this to the very high levels of productivity achieved by them, while there is no doubt that they also had certain in-built excess capacity.[29] All these factors jointly helped the Modis in busting the cartel and thus enlarging its market power.

The 'success story' of the Modis encouraged some of the other recepients of the letters of intent like JK (Singhania House) and Apollo (Raunaq Singh)[30] to enter the market. Both started their commercial operations in 1977. In fact it is quite interesting to note one of the promoters of JK Industries was JK Synthetics (a manufacturer of nylon tyre cord)—the first instance of vertical integration in the tyre industry. Of course this tendency of forward and backward integrations has become more pronounced in the early 1980s and the rationale for this seems to be the desire to increase the market power of each firm by having control especially over the input, and in certain cases, the output market too.

To take advantage of the rising demand for two wheeler and three wheeler tyres, Falcon Tyres came up in 1975, for the exclusive manufacture of these items. It is interesting to note that it came up in technical collaboration with MRF—the first case of horizontal transfer of technology in the industry. Finally Vikrant Tyres was set up in 1980 for the manufacture of different kinds of tyres. The letter of intent for this company was taken in the early 1970s (along with Modi, Apollo and JK) by a Madras based private firm named South India Export Co Pvt Ltd. The original promoter ran into financial difficulties and the project was finally implemented by the active co-operation of Karnataka Industrial Investment Corporation. It was thus the first tyre company in the joint sector.

Thus of the four major tyre companies which came up in the 1970s, three of them were promoted by business houses. None of the State Industrial Development Corporations which had taken letters of intent along with these firms in the early 1970s, have implemented their projects; hitherto supposedly due to lack of adequate financial resources.[31] However all those three business houses were assisted by public financial institutions and nationalised banks (e g, 38, 35 and 29 per cent of the total capital cost of Apollo, Modi and JK respectively, were met by the institutions and banks). The precise reasons as to why the SIDCs did not implement their projects at a time when there was enough scope for new units need to be looked into. Non-viability of their initial (proposed) scale of operation could not have been a factor as all the units, with the exception of the Modis, were of three lakh capacity and have later on substantially expanded their capacities in varying magnitudes once they came into commercial production.

Meanwhile in 1976, after protracted proceedings, the MRTPC inquiry was completed. The Commission found sufficient evidence for cartelisation and hence

TABLE 9: STRUCTURE OF THE INDIAN TYRE INDUSTRY (AS ON 31-3-1984)

Notes: 1 Sl Nos 1 through 3 are under the management of the Goenkas and 4 to 5 under that of the Modis.
2 Wholly owned subsidiary of Dunlop India till 1979. Uses DIL's manufacturing facility.
3 Good Year is the only MNC in the tyre industry now.
4 Government approval has been received for setting up a new plant with an installed capacity of 8.25 lakh tyres at Gujarat.
5 Sl Nos 13 to 15 manufacture only 2/3 wheeler tyres.
6 Commercial production commenced only in November, 1983.
7 KTC is a joint sector project with Kerala State Industrial Development Corporation and P V Chandran who, among other things, owns rubber plantations, as joint promoters.

passed a "cease-and-desist" order against the tyre companies.[32] This led to the formal breaking up of the cartel. By this time with the strong challenge provided by the Modis and with the increase in the number of new firms, we see a fall in concentration. As noted above, Modis soon emerged as the price leader, beating even well established names like Dunlop.

The industry during the late 1970s and early 1980s affords a classic example of price leadership being used to establish a price structure which tended to yield collusive profits. The Big Four (*viz*, Modi, Dunlop, Ceat and MRF) selling from 70 to 73 per cent of industry output, clearly recognised their mutual interdependence. This was quite evident from a price increase effected by all the companies together in March 1978.

Once again this attracted the attention of the MRTPC, which instituted an RTP enquiry on 6-7-1978. The main complaint was that the tyre firms were all acting in concert while fixing prices of tyres and tubes. The enquiry has since been disposed of vide order dated 24-3-1983. The respondent firms have given undertakings assuring that they will not indulge in any concert in fixing prices at any time.

A higher installed capacity than the projected demand for all kinds of tyres made licensing of new units difficult to justify. It should also be borne in mind that licensing remains the main barrier to entry (in most industries) in the Indian manufacturing sector. Since there is no substitute for tyres, the tyre manufacturers enjoyed a certain degree of discretion in choosing the price of their product.

However such discretionary powers have become increasingly constrained, in these days, especially due to two factors. First, is the technological changes in the retreading system, which can cut deep into the demand far new tyres from the replacement market. This could be explained as follows:

The demand for tyres originates from two kinds of markets, original equipment and replacement with the former constituting ⅓ and latter ⅔ of the total demand. Because of the high price of tyres, consumers in the replacement market and especially those for passenger car tyres, have been increasingly turning their attention to retreading their old tyres than purchasing a new one.[33] But the latest technological developments in retreading systems and especially the cold process pressured retreading have considerably enhanced the retreadability factor and might in the years to come pose a serious challenge to the demand for new tyres from the replacement market.

Second it is the stiff consumer resistance which has constrained the abilities of the tyre manufacturers. Various consumer organisations like the All India Motor Transport Congress—an apex body of truck operators in the country—have been in the vanguard of such resistance movements. The government has also referred, complaints against tyre companies, received from various quarters to the MRTPC. There are at present 8 RTP enquiries going on either against all the companies or against certain individual firms relating mostly to pricing behaviour. Very recently the government has even appointed a full-fledged Committee on Tyres and Tubes (known as the Satyapal Committee) to make a comprehensive study of the industry.[34] Among the terms of reference are, "to review and recommend rationalisation and improvement of distribution system of tyres after looking into the complaints thereto". Finally the BICP has also been involved in making cost of production studies, from time to time, to see if price increases effected are justifiable. However even with all these government surveillance machinery, the industry has been proceeding on its own course, which can have serious repercussions on the future pricing behaviour of the industry.

These changes have become very pronounced in the 1980s—changes which are altering the degree of concentration in the industry and affecting the market power of certain firms. Inchek Tyres, one of the three Indian firms which came up during the second phase ran into severe managerial and technical difficulties which finally resulted in its nationalisation by the Central government. Now known as the Tyre Corporation of India, it has become the first public sector company in the industry. Dissatisfied with the provisions of the FERA and more due to the financial position of its parent firm, Firestone decided to sell off its Indian subsidiary. It was acquired by the Modis in 1981 and by virtue of this it was able to control approximately 25 per cent of the market.[35]

In the same year Ceat was taken over[36] by the Goenkas (K P Goenka House)—a Calcutta based business house, which has acquired a reputation for take over in the country. Very recently the Goenkas have taken control over Dunlop too and consequently have emerged as the largest group in the industry, controlling about 35 per cent of the industry's output. As a result the Modis and Goenkas, would be controlling about 60 per cent of the market which would mean that the concentration in the industry is once again on the increase.

It may be quite natural that the Goenkas have virtually integrated, forwards, into tyre manufacturing as they already had controlling interests in certain inputs used in the tyre industry like carbon black, bead wire and tube valves. Recently in a spate of take overs, the house has extended its control over other inputs like nylon tyre cord, tyre machinery and rubber chemicals.

Tables 7 and 8 illustrate the house's control over the various inputs.

Tables 7 and 8 clearly bring out the predominant position of the Goenka's in the industry. All these will have important implications for the future growth of this group and might pose a serious threat to the Modis in wresting the leadership. Modis too, on the contrary, in their attempt to retain their market power have been trying to integrate backwards and have therefore taken letters of intent for the manufacture of nylon tyre yarn and steel tyre cord. A vain attempt was also made to take over Firestone's equity holdings in the leading synthetic rubber manufacturing unit in the country.

Very recently two more business houses have either entered the market or in the process of entering it: Srichakra Tyres belonging to the TVS Iyenger Group has already commenced commercial production while Kesoram Industries and Cotton Mills, belonging to the House of Birlas has received a letter of intent for the manufacture of one million tyres and tubes per annum. For both the houses it is a backward integration from vehicle manufacturing (Sundaram Clayton and Ind-Suzuki in the case of TVS and Hindustan Motors in the case of the Birlas).

Table 9 illustrates the present structure of the industry.

## V

## Policy Implications

We thus see that the government has tried to deconcentrate the industry by licensing more units. However the collusive practices, and of late the horizontal and vertical integrations, have effectively neutralised this policy. The result has been that the concentration in the industry which had declined for a while, especially in the early part of the second phase, is once again on the increase. Even for the short periods when concentration had declined, the collusive practices of the firms in either of the cartel or price leadership variety, have resulted in abnormal prices being charged.

Another important feature is the exit of some of the original and well known MNCs like Dunlop, Firestone and Ceat. But this has however to be seen in the context of the severe recessionary conditions obtaining in the western tyre industry and the consequent impact of it on the operations of their respective parent firms.

### Notes

[This paper forms a part of my Ph D dissertation being submitted to Jawaharlal Nehru University. In working out the ideas contained in this study I have drawn liberally from my contribution in a joint paper entitled, "Competitiveness in the Indian Tyre Industry: 1936-1984", by myself and P K Michael Tharakan. I am also grateful to Chiranjib Sen, K K Subrahmanian, D Narayana and R Nagaraj for discussing various aspects of the present paper. However the remaining shortcomings are of course mine.]

1 The literature on business house concentration is quite vast. However the following two studies are quite comprehensive in their scope and coverage. Chandra N K (1979), 'Monopoly Capital, Private Corporate Sector and the Indian Economy: A Study in Relative Growth, 1931-76', *Economic and Political Weekly*, Vol XIV, Nos 30, 31 and 32 (Special Number), pp 1243-1272. Ranganekar, D K (1982), 'Growth of Big Business Houses', *Business Standard Annual*, pp 9-18.

2 See Sandesara, J C (1979), 'Size of the Factory and Concentration in the Factory Sector in India, 1951-1970', *Indian Economic Journal*, Vol 27, No 2 (October-December), pp 1-34.

3 For a fairly detailed survey of concentration-profit relationship, based on the US manufacturing industry, see Weiss, L S (1974), 'The Concentration—Profits Relationship and Antitrust', in Harvey J Goldschmid, et al (ed), "Industrial Concentration: The New Learning", Little, Breson and Company, Boston, pp 184-233.

4 The Dunlop Rubber Co Ltd, of England commenced their trading activities in India as importers and distributors of their tyres and tubes in 1898. However in 1926, Dunlop Rubber Co (India) Ltd was floated as a public limited company for taking over these activities. Till 1936 these activities were confined to importation and distribution of tyres and tubes.

5 Tomlinson, B R (1978), 'Foreign Private Investment in India, 1920-1950', *Modern Asian Studies*, Vol 12, No 4, p 669.

6 Ibid.

7 Jones, Geoffrey (1984), 'The Growth and Performance of British Multinational Firms before 1939: The Case of Dunlop', *Economic History Review*, Vol 37, No 1, February 1984, p 50.

8 Ibid.

9 The Good Year Tyre and Rubber Co of India Ltd was registered as a trading company in 1922. Prior to that date Good Year products were sold throughout India through distributors, but after 1922 the business of distribution was taken over by the company.

India Tyre and Rubber Co, of Scotland commenced distributing their products in India through distributors in 1930. In 1938, it was incorporated as an Indian company, from which date distribution of their products was handled by the company itself. Though it had become a wholly owned subsidiary of Dunlop UK as early as 1933-36 it was only in 1979 that it became one of Dunlop India's.

10 See, "Report of the Taxation Inquiry Commission" (1955), Government of India, Vol 1, p 122.

11 The tyre manufacturers have been consistently inflating their selling and distribution expenses, right from the beginning. This was because this item or what is termed at present as Post Manufacturing Expenses (PME) were not exciseable. However recently (i e, October 1983) the Supreme Court ruled that the tyre companies (among others) have to pay excise duties, not just on current manufacturing costs, but also on post manufacturing expenses, as the total of both go to determine the final selling price. The arrears on excise duty from tyre companies (PME cases) as on 15-7-1984 works out to Rs 186.57 crore. No individual cases having a bearing on PME pertaining to tyre industry has yet been decided by the Supreme Court or the High Courts.

12 Firestone Tyre and Rubber Co started their import business in tyres and tubes in India in 1930. They established themselves as a manufacturing concern in 1939. Firestone was a private limited company with a paid-up capital of Rs 20,000 made up of 200 shares of Rs 100 each, all of which are held by the Firestone parent company in USA. For all practical purposes the Indian company functions like a branch of a parent company obtaining funds for capital expenditure (when needed) from the latter and remitting all surplus profits to the parent company as dividends without maintaining a reserve fund. In addition, the domestic subsidiary also paid royalty to the parent firm at the rate of 1.5 cents per each 100 lbs of all products manufactured in the Indian plant, for having access to the research facilities of the parent firm.

13 The products manufactured under these projects were mostly sold to government or under government's instructions at negotiated prices. At the end of the war, the firms took over many of the plants by paying for them and there is no evidence that the plants were sold to them at concessional rates. See, Tariff Commission (1955), op cit, pp 125-128.

14 The target was not fixed at one stretch.

15 Madras Rubber Factory or MRF as it has later come to be called was established in 1946 for the manufacture of toy balloons and since 1953, it started the manufacture of camel back or tread rubber. For a good account of the early history of MRF and specifically how the tyre project came about, see Philip, K M (1977), "Memoirs of a Working Life", Polymer Publications, Bombay, pp 91-174.

16 Firestone applied for SE licence in August 1961 and a letter of intent was issued in September, 1962. The condition attached was that the company should have Indian participation to the extent of 40 per cent. The firm agreed in August 1964 to have 30 per cent Indian participation. The company however did not comply with the necessary formalities and hence the letter of intent was cancelled in August 1968. This only shows the aim of the firm was only to pre-empt new entrants and thus create an artificial barrier to entry. For details, see, "Report of the Industrial Licensing Policy Inquiry Committee", Main Report, Government of India, 1969, p 92.

17 See, Philip, K M (1977), op cit, pp 168-169.

18 Even the request by the new Indian companies to give a preferential treatment to them in state purchases and especially those by the state transport undertakings was not heeded. This behaviour of the Government of India is in sharp contrast to the stores purchase policy of the British government which favoured only local companies.

19 See, Philip, K M (1977), op cit, p 170.

20 It is quite interesting to note that there were parallels to such collusive behaviour as early as 1929 in the British tyre industry. In 1929 Dunlop took the lead in establishing the Tyre Manufacturers Conference (TMC); to provide machinery for joint consultation within the industry, to eliminate price cutting and to regulate distribution. The conference was instrumental in restricting competition, chiefly by establishing recommended prices; limits were agreed on 'wasteful' advertising. Identical prices, to be followed by all producers and distributors, were set for the same size and type of tyre in the replacement market; an Investigation Department of the British Motor Trade Association 'staffed mainly by retired police officers' was used to enforce the set prices. For details, see, Prais, S J (1981), "Productivity and Industrial Structure", Cambridge University Press, 1981, pp 210-212. It is quite plausible that the "code of conduct" for the Indian tyre industry was based on the British one.

21 See, ILPIC Report (1969), p 92.

22 We had already seen above that Firestone was not interested in bringing down its foreign equity holdings and was therefore not interested in expanding its capacity because if it were to expand it had to comply with the government stipulation about its shareholding. However it is not known as to why Good Year did not expand, but it should also be borne in mind that while Good Year is the largest tyre company in the world, its Indian subsidiary has been consistently "lying low". Premier was to expand in the early 1970s.

23 They were as follows:

| Name | Letter of Intent Issued on |
|---|---|
| 1 Jaswant Worah, Dhanbad, Bihar | 25-11-1970 |
| 2 Universal Tyres Limited, Allahabad, UP | 25-11-1970 |
| 3 Premier Rubber and Cable Industries, Bombay | 8-7-1971 |
| 4 K Kalappa, Hyderabad, AP | 9-7-1971 |

Among these, Universal Tyres belongs to

the House of Birlas. It is quite surprising to note that this firm was issued a licence in August 1961, and according to the ILPIC Report it was revoked in March 19, 1968, for non-implementatin of the same. In 1974, the company surrendered the letter of intent issued in 1971, upon reassessment of the scope and demand for automobile tyres.

24 NCAER, "A Study of Price Control and Impact of Excise Duty on Selected Industries", New Delhi, 1978, p 99.

25 In the meantime, the All India Motor Transport Congress, New Delhi, complained to the Commission in 1972 that all the 8 tyre companies were fixing prices in concert, making discrimination in dealings, restricting and withholding supplies of tyres and making a disproportionate supply to some dealers and discriminating against the others, and that some of them were dumping, on dealers, accessories and other motor vehicle parts not manufactured by them at exhorbitant prices as a condition for the sale of tyres. On the basis of a preliminary investigation by the Director of Investigation, the MRTPC instituted an enquiry in November 1974. Some of the allegations, particularly those of price fixing in concert and discriminatory dealings, were common to this and the other earlier enquiry.

26 See, Modi Rubber Ltd, 5th Annual Report, 1974-75, p 4.

27 There was of course a shortage of nylon tyre cord which would have hampered a smooth change over from rayon to nylon tyres.

28 For a preliminary account of this scheme and the subsequent schemes and the estimated benefits claimed by the various companies, see, Ninan, T N (1984), 'The Excise Exercise', *India Today*, Septembr 15, pp 122-24.

29 See, Modi Rubber Limited, 8th Annual Report, 1977-78, Director's Report, p 4, wherein they refer to a study by IIT, New Delhi and National Productivity Council, of the capacity analysis and utilisation and of the factors which enabled the Modis to obtain substantially higher productivity from their plant without any additional plant or machinery being installed. According to the report, "both these organisations have confirmed that higher productivity has been achieved by us through our assiduous efforts in effecting improvements and innovations in the manufacturing techniques, increase in manning levels, continuous working, overall optimum utilisation of men, machines and materials and harmonious labour relations and without installation of additional plant and machinery".

30 The letter of intent for this firm was obtained by Ruby Rubber Works Limited, a Kerala based cycle tyre firm, the promoters of which had considerable interests in rubber plantations. The promoters of Apollo ran into financial difficulties and hence joined hands with Raunaq Singh in implementing the project.

31 Press reports refer to Gujarat Industrial Development Corporation, joining hands with a Bombay based private firm by name Nirlon Synthetic Fibres and Chemicals (which manufactures among other things nylon tyrecord) in implementing a tyre project, with an installed capacity of one million tyres and tubes per annum in a phased manner. Similarly one also learns APSIDC is implementing a tyre project with APSRTC. However official confirmation is lacking on both these projects.

32 See, MRTPC, New Delhi, "Restrictive Trade Practices Enquiry No 1 of 1971", April 19, 1976.

33 For instance the price of passenger car tyres have registered the highest compound annual growth rate of 13 per cent between 1971 and 1984. However it has registered the lowest rate of growth in output which works out to just 3.65 per cent per annum during the same period.

34 For a comment on the terms of reference of this committee, see, Mani, Sunil (1984), 'Tyre Industry: Taking the Buyer for a Ride', *Economic and Political Weekly*, Vol XIX, No 27, July 7, p 1013.

35 The Union Industry Ministry gave the green signal to the Modi-Firestone deal in late 1981 despite representations made by the Bombay Taximen's Union and the employees of Bombay Tyres to take over the company, reportedly offering Rs one crore more than the Modis.

36 In the late 1970s Ceat's parent firm, Ceat Gomma SPA, Italy ran into a series of financial difficulties and therefore decided to phase out tyre manufacturing operations which were no longer financially viable. As a result 11 per cent of the shareholding of Ceat India was passed on to Indian shareholders and in that process the Goenkas took over the company.

# The 'Macro-Economic' Study of the 'Public Enterprise Sector'

**Ramaswamy R Iyer**

*Faced with sub-optimal performance by public enterprises and the strains which this imposes on the national plan and the budget, we can either consider how best that performance can be improved, or assume that public enterprises as a class are bound to be less efficient than private enterprises and recommend privatisation. Those who have no doctrinal discomfort with the notion of public enterprises will take the first course; and those who believe that the market is the norm and that any deviation from it (including the advent of the state into business) is a 'distortion', will tend towards the second course.*

*In terms of practical recommendations in a given situation the two groups may possibly find themselves in agreement. Those who believe in a mixed economy could be mindful of the need to keep the growth of public enterprises within manageable and monitorable limits, to conserve scarce financial and managerial resources for important purposes and activities, and to shed public investments of no great consequence. Those who basically believe in free market economies and minimum state intervention could also be realistic enough to accept the position assigned to public enterprises in the strategies of many developing countries, and to concede that ways and means must be found to improve the performance of public enterprises while keeping them public, and that privatisation can at best be a remedy of the last resort, to be applied only in a very limited number of cases.*

*And yet a difference in attitude and bias remains; and it is this which becomes evident in the terms in which 'the macro-economic analysis of the public enterprise sector' is advocated by some.*

## I

IN the field of public enterprises, a new kind of study has made a tentative advent in recent years, *viz*, the macro-economic study of the public enterprise sector in developing countries. The tentativeness arises from methodological difficulties and not from any doubts concerning the nature and significance of this kind of study. The argument for such studies runs as follows. Over the years public enterprises have been growing in number, size and importance in most developing countries. Their share of the national output has been increasing. They account for a substantial part of the national investment. There are massive transfers from the government budget to public enterprises in many countries not only towards new investments but also to cover working capital needs or current deficits. Public enterprises are thus of considerable consequence in the national planning and budgeting processes, and in a number of cases they contribute significantly to the budget deficits or external debts of the countries concerned. It follows that the macro-economic aspects of the existence and activities of public enterprises need to be studied; the results of such studies would be of interest to those responsible for planning or budgeting or the management of the external debt as well as to students of the economy in general; they would also provide a basis for the formulation not merely of macro-economic policies in general but also of policies towards public enterprises themselves.

That seems a fairly straightforward, almost self-evident argument; and yet with a little reflection the surface simplicity disappears and unsuspected depths become evident. While not questioning the validity of the general tenor of the argument summarised in the preceding paragraph, this note will endeavour to examine some obscurities and complexities, and to signpost the conceptual, logical (and ideological) quicksands that lie below the surface.

## II

The quotation marks within which the two key expressions in the title have been placed indicate some reservations; the doubts regarding the two expressions are in a way interrelated, and can be summed up in the question: "What is 'the public enterprise sector' and what is the 'macro-economic' study of it?" The macro-economic study of an economy is a clearly understood discipline—an important part of economics: one can study output, consumption, saving, investment, capital formation, internal transfers, etc, in the economy. One can also understand the importance of the disaggregation of the national accounts by segments of the economy or categories of activity or actors such as production/infrastructure/services; agriculture/industry; specific industries; firms/households/individuals; and so on. But how does the category "public enterprise sector" fit into this system? Is it an economic category at all? Is it not rather an organisational category belonging to public administration or management studies, and extraneous to macro-economics? It is often argued that national accounts do not distinguish between the public and private sectors, and need to do so. But how is this disaggregation to be achieved? By distinguishing between "public" and "private" units in (say) an industry? But what is the difference from a macro-economic point of view between, say, a private sector steel plant and a public sector one? Both will buy input materials (or have captive sources), draw utilities from public systems (or have captive supplying plants), employ skilled and unskilled workers, produce finished products (adding value in the process) and sell them to users, industrial or individual. A steel plant is a steel plant whether in the private sector or in the public sector and has the same kind of interrelationships with other economic activities in either case (and steel is steel, and value added is value added in either sector). The only difference is in the pattern of ownership (and/or control). While the national accounts can be disaggregated by industry, and we can examine the interrelationships of, say, the steel industry, and "disaggregation" between "public" and "private" within this seems to import an extraneous category into the area of macro-economic analysis.

But of course the recommendation of such disaggregation is not based on any presumption of a qualitative difference between "value addition" in a public sector plant and that in a private sector plant in a given industry. The aim is rather to arrive at economy-wide totals of value addition (say) in public enterprises in all areas of activity (public sector steel plants, fertiliser plants, engineering units and so on). Leaving aside for later consideration what we can do with such magnitudes, the question to ask at this stage is: how to arrive at such magnitudes? The thought that his note would put forward in this context is that the "public enterprise sector" is merely the totality of public enterprises in an economy, and has no other conceptual or structural significance; and that the best means of obtaining figures for "the public enterprise sector" as a whole is to follow the logic of the expression and put together the figures relating to all the public enterprises. In other words, we need not start with the national accounts, try to disaggregate them for a category which is not a logical or economic category at all, and perplex ourselves with all kinds of conceptual and methodological questions; we need merely start with enterprise accounts and aggregate the figures relating to the totality of public enterprises. (It will of course be necessary to bring the figures of diverse enterprises to a uniform basis for aggregation; and to effect a reconciliation of these figures with corresponding figures in records maintained in the Administrative and Finance Ministries).

The observation that "the public enterprise sector" is not a logical category at all may seem surprising. The point being made is not that there are differences in the definitions of "public enterprises" in different countries, or (from time to time or industry to industry) even in the same country; or that it is difficult to determine the precise combination of public ownership and control which should be adopted as the criterion for categorising a unit as a public enterprise. We are all familiar with these problems, but there are workable definitions in use. What needs to be noted is that all these are definitions of "public enterprise" and not of "public enterprise sector". The "sector" is merely an agglomeration of public enterprises. But in what sense is this a "sector"? One can understand the distinction between the rural and urban sectors; the agriculture and industry sectors; the manufacturing, trading and service sectors; the large-scale and small-scale sectors; the corporate and non-corporate sectors; but what precisely is the public enterprise sector? The purpose and objectives for which public enterprises are established vary so much, and there are so many different ways in which they come into existence, that together they cannot be said to form a "sector" of the economy in any structural or taxonomical sense. (The public/private sector distinction is of course something that one can grasp. In that distinction "public sector" is a much wider concept than "public enterprise sector" and encompasses the totality of public systems including the government.)

We shall revert to the legitimacy of the concept of "public enterprise sector" later when considering the question of performance evaluation. Meanwhile, the point sought to be made is that if we want to study the "macro-economic" aspects of public enterprise operations, we shall do well to start at the enterprise level and aggregate the figures drawn from enterprise accounts. The result may indeed be a magnitude having macro-economic significance, but it could be built up from "micro" levels.

## III

Even with that re-defined approach the aim is still to arrive at aggregate figures relating to the totality of public enterprises, as these are felt to be magnitudes of some macro-economic significance. The question to be considered next is: What purposes can they be made to serve?

If our aim is to study the role or roles of public enterprises in socio-economic development in developing countries then we have to recognise that macro-economic studies can tell us very little. Public enterprises are established for a wide range of purposes and objectives and they are expected to play a multiplicity of roles. Among the aims and goals of national planning are the following: the promotion of industrial development and economic growth; the development of the infrastructure needed for such growth; the channelling of investments into areas and activities not favoured by private investment; the stabilisation of the supplies and prices of some essential commodities; export promotion; import substitution; the promotion of self-reliance whether in regard to certain basic industrial and constructional materials such as steel or non-ferrous metals or agricultural inputs like fertilisers or vital defence requirements, or in regard to technology; the building-up of trained industrial, technological and managerial manpower; the conservation and planned utilisation of scarce natural resources; industrial dispersal and the development of as-yet-undeveloped regions; the generation of employment; the fostering of small-scale industry and entrepreneur development; the ensuring of social control over important sectors of the economy and vital industries (the "commanding heights"); the prevention or abatement of monopoly power and influence over the economy on the part of large private (domestic) groups or transnationals; and so on. Public enterprises are often established as instrumentalities for the achievement of one or more of these objectives. At the same time, they are also (often) expected to generate resources for re-investment, function as model employers, promote the welfare of their employees, provide medical, educational and other facilities not only to their workers but also to the people in the areas surrounding their plants, show a concern for emvironmental protection, serve as promoters of certain national policies such as adult education or family planning, etc. They are also sometimes thought of as modernisers and as instruments of social transformation. Any study of the "role" of public enterprises will have to identify which of the items in that long enumeration apply in a given case and then proceed to examine how well or ill the role (roles) has (have) been played. Clearly, a macro-economic study would be relevant to only a few of the aspects listed above.

The macro-economic study of public enterprises in the aggregate can mainly tell us two things: (a) the size and extent of the public enterprise presence in the economy as a whole or in specific segments of the economy (e g, in particular industries); and (b) the flow of resources from the government to public enterprises and *vice versa*. The usefulness of this kind of information and the need for macro-economic analyses for this purpose need to be looked into somewhat more closely

Indicators such as share in the national output or investment can give us an idea of the magnitude of the "public enterprise sector". This is a measure which is relevant only in a mixed economy. In a fully socialist state, the aforesaid magnitude has to be by definition close to 100 per cent; there is little room for private enterprise except perhaps in agriculture and in small-scale retail trade and minor services. In a country with a political philosophy which envisages a private sector as well as a public sector, and which has definite ideas regarding the position which public enterprises should occupy and the kind of influence they should exercise in important segments of the economy, studies which give an indication of the magnitude of the public enterprise presence should certainly be of interest; and it is reasonable to suppose that such a macro-economic analysis would be an important basis for policy decisions in such a system.

Even in such a context, however, we must be careful not to entertain exaggerated notions of the practical importance of such studies. Most developing countries have a good knowledge of the existing configuration of public enterprises and private sector units (including large domestic industrial groups as well as foreign companies and transnationals); the extent of power and/or influence wielded by the latter; the effectiveness of their own control and regulatory policies and instruments; and the adequacy or inadequacy of the pace of new investments in certain directions: and in the light of that knowledge, form their judgment as to where the regulation and guidance of private activity needs to be supplemented by direct public investment or by a strengthening of the existing public enterprise presence. Such judgments are often based on direct knowledge of events and developments and do not await macro-economic analyses, though such analyses are bound to be useful in periodical reviews of position and policy.

Where a very substantial public enterprise presence has been brought about as a matter of policy, macro-economic magnitudes will tell the government only what it knows already. It is only in those cases in which there has been an inadvertent slide towards a higher public enterprise presence than planned, that the magnitudes brought out by macro-economic studies can tell the government something new; even in such cases, however, the excessive growth of public enterprises would have made itself felt in other ways, such as increasing drafts on the budget for new investments, strains on the administration and managerial capabilities, etc. (Theoretically, a macro-economic study could also lead to the conclusion that there should be more public enterprises; but one suspects that most of those who stress the importance of macro-economic analyses of the public enterprise sector for policy reviews and decisions would be surprised and uncomfortable, if the decision were to increase the public enterprise presence!)

Further, assuming that a macro-economic analysis shows that public enterprises account for x per cent of the GDP or y per cent of the value added in a given industry, what follows? An overwhelming public enterprise presence may be an indicator of the socio-political complexion of the country; but in such a case, one could have known that complexion in advance of any macro-economic analysis. In most cases, however, public enterprises are brought into being as instrumentalities of certain public purposes, and the mere fact that public enterprises account for a certain share of the national output or investment is of no great significance; we have to go on to examine how effective they have been in subserving the intended purposes and objectives.

Size is also not necessarily an indication of strength or influence. The relative importance of public enterprises in two countries cannot be guaged by a comparison of the respective shares of public enterprises in national output or investment in the two countries. A country may build its public sector around an existing private sector, and limit public investments with reference to the availability of financial resources and entrepreneurship in the private sector; and yet the public enterprises in that country may be as strong and influential as those in another country with a bigger public-enterprise share in output and investment.

Lastly, macro-economic magnitudes must of necessity ignore qualitative considerations. Let us take a hypothetical case of two countries with one public enterprise each, the share of the public enterprise in the national output being the same in the two countries; can we infer that the position or importance of the "public enterprise sector" in one country is similar to that in the other? How would this inference be affected if we found that the public enterprise in one country was a fertiliser plant and that in the other was a cosmetics plant?

But such "cross-country comparisons" can be highly misleading and are probably unrewarding exercises. If, as has been argued, there is an enormous diversity of public-enterprise characteristics, features and circumstances even within one country, the diversities between one country and another are even greater; and the "public enterprise sectors" of two countries cannot really be compared. Comparisons are indeed possible (and often very useful)—with due attention to local circumstances and factors—in regard to organisational and structural patterns, patterns of government-enterprise relationships, personnel policies, management styles, modalities of control, accountability agencies and arrangements, etc, between one country and another. However, cross-country comparisons of macro-economic magnitudes and relationships pertaining to public enterprises are beset with so many pitfalls, and need such a weight of caution and interpretation, that one wonders whether they are worthwhile at all.

In any case, such comparability cannot be assumed in advance. It is sometimes argued that methodology and criteria for macro-economic analyses should be so devised as to facilitate cross-country comparisons at a subsequent stage. This presumes the possibility of such comparisons. The macro-economic study of public enterprises in a country is in itself sufficiently difficult not to need the complication of an advance plan of comparisons with other countries. Such a study has to be necessarily country-specific; the best course would be to proceed with the assemblage of enterprise-level data and build up aggregates, and at a later stage to attempt comparisons with other countries, if such comparability exists.

Further, it must be borne in mind that it is the individual enterprise which, as an economic actor, has an impact on the economy. A large public enterprise—say, a large steel plant, or the national shipping line or airline, or a large mining organisation or power-generation complex, or a state trading organisation with a large turnover—is certainly likely to have a significant impact on the economy; but so will a large private sector organisation: the impact arises from the importance of the activity, the complex interactions with other economic actors and the sheer magnitude of the operations, and not from the fact that the unit is in the public or in the private sector. There is indeed a case for disaggregating the national accounts not merely by segments like agriculture or industry or services, or by particular industries, but also in such a way as to exhibit separately very large organisations having a significant impact on the economy. As a matter of fact, most of them may be public enterprises, but this is not necessarily so; we all know the importance of the large corporations in the USA (e g, the saying "What is good for General Motors is good for America"), but even in developing countries there are large private sector corporations or complexes whose existence and operations are of considerable consequence to the economy. But when we speak of the impact of "the public enterprise sector" we are unconsciously (or consciously) attributing the impact, not to the nature and magnitude of the activity, but to the fact that it takes place in public enterprises. The implication is that the impact would have been different, had the same activities taken place in the private sector. This in turn frequently carries the further (and not so very subtle) implication that that alternative situation would have been better for the economy.

## IV

All those reservations were meant to qualify but not to deny the statement that indicators of the size and extent of the public enterprise presence derived from macro-economic analyses can serve certain useful purposes. Let us consider next the usefulness of information regarding resource flows between the government and public enterprises. The planners, in estimating the resources available for the plan, are interested in determining the extent to which they can reckon on the generation of resources by public enterprises. The Finance Ministry officials in their budgetary exercises need to know the likely drafts on the government budget by public enterprises. It is essentially from the planning and budgetary points of view that aggregate figures relating to public enterprises as a whole are necessary and useful. By the same token, however, this information is so necessary a part of the planning and budgetary exercises, that it is already being obtained in most countries. As a matter of routine public enterprises are asked for projections of deficits/surpluses, fund requirements for projects under construction, and other relevant information needed for national planning and budgeting. There are certainly deficiencies in the availability and quality of data, and there is need for improvement in their timeliness and reliability. What is needed , then, is not so much the development of new methodologies or indicators, as improvements in the data already identified as needed. This is not to deny the usefulness of macro-economic analyses of public enterpirses from the government's budgetary point of view. Indeed, here we come to the heart of the matter: it is the concern with deficits, subsidies and losses that provides the main motivation for "macro-economic" analyses of public enterprises. Those who urge such studies are primarily interested not so much in the "role" or roles played by public enterprises in the socio-economic development of developing countries, as in the role played by them as contributors to the budgetary deficits or aggravators of external debt-servicing problems. The key words often used are "macro-economic impact", "drain on the budget", etc. Public enterprises are essentially perceived as drags on the economy and it is that perception which lies behind much of the advocacy of macro-economic analyses of the "public enterprise sector". Thus in many cases a negative attitude to public enterprises colours the advocacy and practice of macro-economic analyses of those enterprises. It is of course entirely possible for a concern about budgetary deficits to be combined with a positive attitude towards public enterprises and an unreserved acceptance of the role or roles envisaged for them by many developing countries; but that combination is not often found.

However, we need to look a little more closely at the expression "public enterprise deficits". That is a summary and general description of the financial results arising from a multiplicity of factors; and the mix of factors varies from enterprise to enterprise. The following are some of these:

(i) the quality of the original (governmental) investment decision leading to the creation of a public enterprise or the undertaking of a new project (if the investment decision was illconsidered or unsound, there are limits to the extent to which subsequent good management can overcome the consequences of that decision);

(ii) governmental policies such as the subsidisation of inputs or outputs, restraints on public-enterprise pricing, etc;

(iii) bureaucratic or political interventions in executive action and decision-making in public enterprises, and the erosion of the autonomy of the managements;

(iv) extraneous circumstances such as the prevalence of nation-wide or even international recession leading to marketing difficulties or even cut-backs in production, infrastructural problems (such as the inadequate availability of power supplies or coal or rail-transportation facilities) which affect the production and marketing plans of manufacturing public enterprises, industrial action by workers, and so on;

(v) factors which are within the control of management, and the quality of the management.

Each of these accounts for a part of the final result and we cannot lump all these components together under the umbrella term "public enterprise deficit". In so far as the deficits are attributable to the unsoundness of the origianl investment decision or to governmental policies regarding subsidisation of public-enterprise pricing or to governmental interventions in executive action or decision-making by public enterprises, we are assessing the performance not of public enterprises but of the government: the "economic impact" here is not that of "the public enterprise sector" but of the government as economic policy-maker and administrator. (As regards external factors such as demand recession, infrastructural problems and so on; these are bound to affect both public and private enterprises. It is rather difficult to distinguish between "external" factors and factors within the control of the management. To a considerable extent, good management consists in managing both these, and in internalising factors which are at first sight felt to be external.) It is that part of the deficit in any given case which is attributable to poor management and to an inability to cope with "external" factors, which can be truly described as the deficit contributed by the public enterprise in question.

It is of course individual enterprises and not "the public enterprise sector" which are well or badly managed. This will be elaborated further in the next section. Meanwhile, the above analysis seems to point to the conclusion that "public enterprise deficits" call for a study not of "the macro-economic impact of the public enterprise sector" but of (a) governmental economic policies; (b) the quality of investment-decision-making in government; (c) the relationship between the government and public enterprises; and (d) the quality of management of individual enterprises. But of course it is quite clear that when economists of a certain persuasion use the expression "the macro-economic impact of the public enterprise sector", they really have in mind the larger question of state intervention in the economy and the use of the instrumentality of public enterprises in this context, and not merely the question of the performance of public enterprises; on the other hand, when governments—particularly the finance ministries—talk about the deficits contributed by the public enterprise sector, they tend to use this phrase as a convenient hypostatisation which could be held responsible for a substantial part of the budget deficit overlooking the government's contribution to and impact on the performance of public enterprises. Certainly, some public enterprises are a drag on the economy, and drastic decisions are called for in such cases; but this is evident enough even without "a macro-economic analysis of the public enterprise sector". Governments of reasonable competence know which enterprises are making heavy drafts on the budget and having an adverse effect on the economy, and if they are unable or unwilling to take drastic decisions, the reasons are likely to be complex and of a socio-political nature; and governments which do not even know which enterprise is making what kind of a draft on the budget, have to make basic improvements in their budgeting and in information flows from the enterprises, and are unlikely to be able to undertake sophisticated macro-economic analyses, or to use such analyses if made by an external agency.

## V

Apart from their usefulness in the budgetary context, macro-economic studies of "the public enterprise sector" are also said to be useful for assessing the performance of the sector. That brings us back to a question referred to earlier in a different context: in what sense is "the public enterprise sector" an entity, i e, something more than the totality of public enterprises? When we use expressions like "evaluating the public enterprise sector" we are making one of two assumptions, *viz*, that all public enterprises put together form an entity with a performance of its own which can be judged; or that while the "public enterprise sector" may not be a separate entity, public enterprises as a class have a common (or average) standard of performance which can be measured and compared with that of private enterprises (again, considered as a class). What is the warrant for either assumption?

As already mentioned, in measuring the performance of public enterprises allowance must be made for the impact of government policies and interventions; but once such adjustments have been made, it would be logical to suppose that performance will vary from one public enterprise to another in relation to the quality of the management. It seems hardly likely that all public enterprises in a country will be managed equally well or equally badly: there will be extremely good performers and extremely poor performers, and a whole range in between. How then can we lump them all together and talk about the performance of the "public enterprise sector" as a whole, as if it were one vast corporate entity?

In the private sector too there are good, bad and indifferent performers, and we normally do not try to assess the performance of the private sector a whole (except that in talking about the performance of the public enterprise sector as a whole, we tend to contrast it unfavourably with a putatively more efficient private sector). We do of course refer to the performance of a whole industrial/commercial complex which may contain a number of companies but is united by a common controlling group; and it may be argued that "the public enterprise sector" is also a similar group united by common ownership by the government. But the analogy is misleading. In the private sector, a group is in a way under a common management; the different companies in the group have their own legal existence, their own boards of directors and substantial autonomy in operational matters, but there are certain matters like major investments which are decided by the top management of the group as a whole (say, through a holding company with its own board). The managerial performance of such a holding company can indeed be evaluated, quite apart from the performance of the subsidiaries. There is no such holding company controlling the totality of individual public enterprises; or if there is one, it is the government itself. Between the government and the individual public enterprises there is no intermediate corporate entity called "Public Enterprise Sector Ltd"! The macro-economic evaluation of the public enterprise sector must thus necessarily become an evaluation of the government's economic management. But if we do wish to undertake that kind of assessment, we have to evaluate the performance of the total government system (policies, strategies, and implementation both by government departments and agencies and by public enterprises). We can evaluate the preformance of individual public enterprises; we can study the total economic management by the government; but we cannot evaluate "the public enterprise sector".

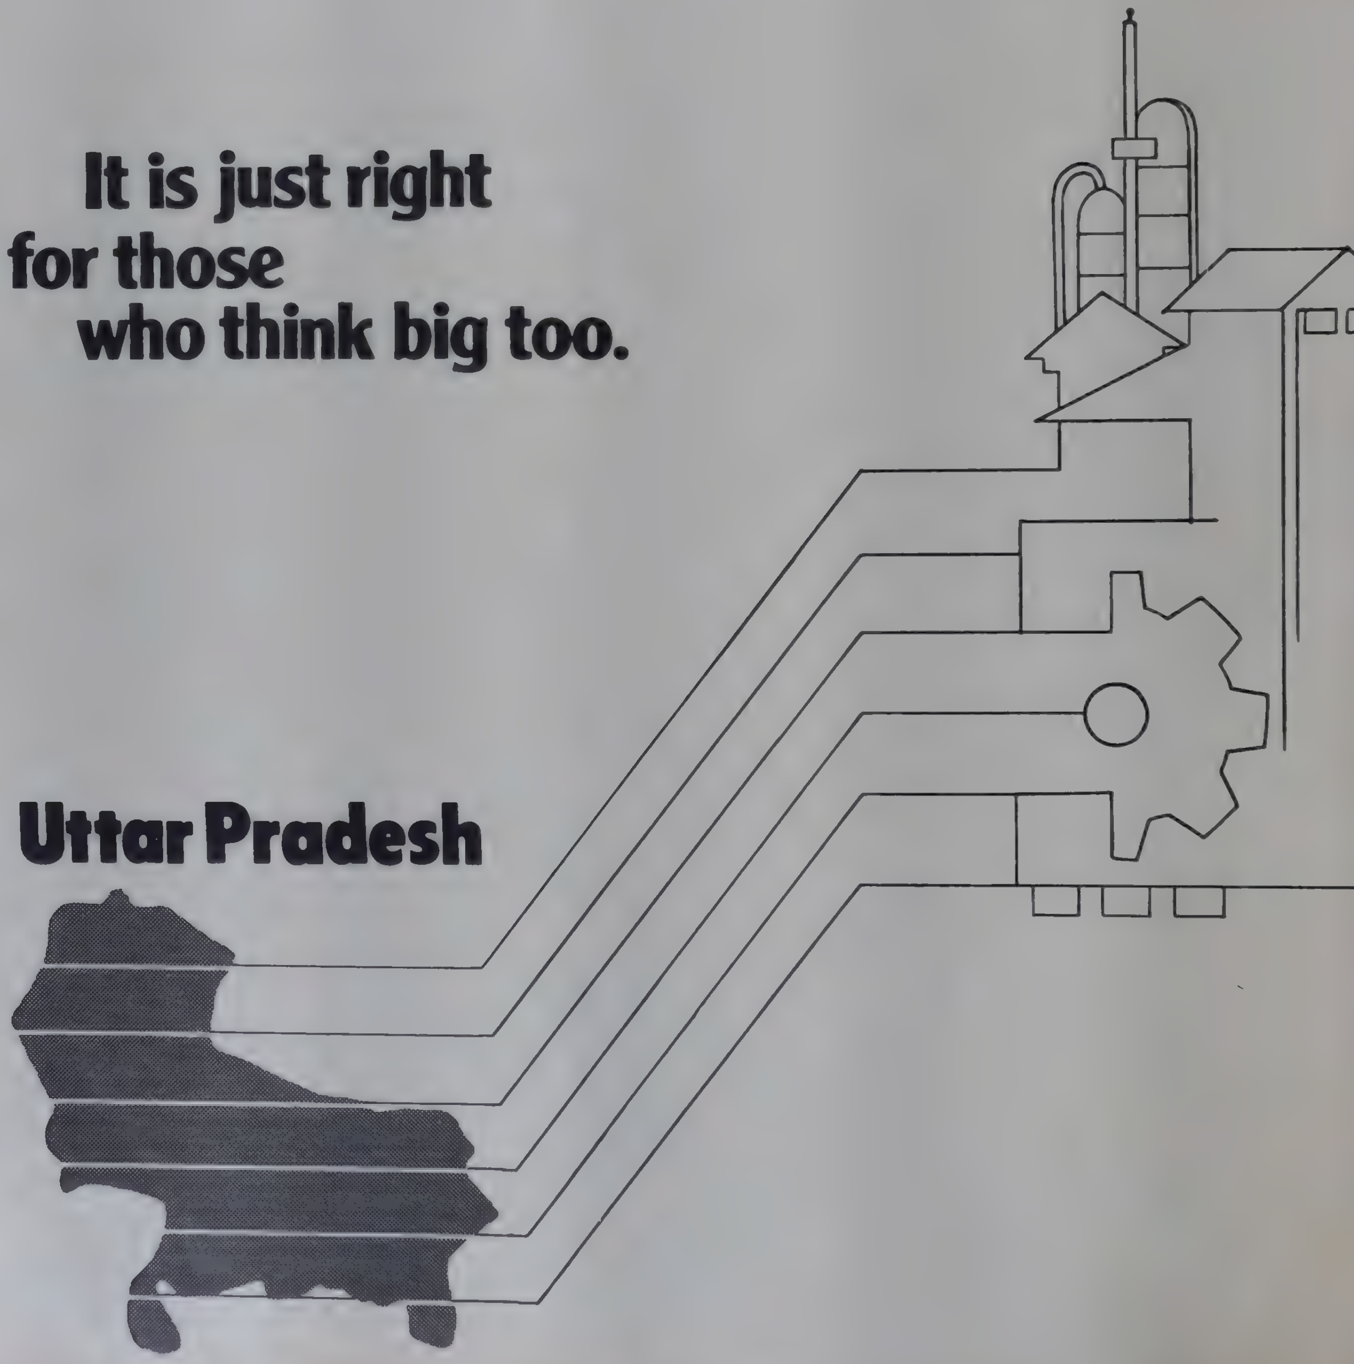
It would be perverse to deny the observable and widely acknowledged fact that—shining exceptions apart—public enterprises are in general less efficient in the utilisation of the investment resources entrusted to them, less cost-effective in their operations, than private sector units. The proposition being put forward here is that there is no warrant for presuming that this is an ineluctable characteristic of an entity called "Public Enterprise Sector Ltd". If indeed we do find that after making allowances for governmental policies and non-commercial objectives, public enterprises, while differing from one another in regard to quality of management, are also in general less well-managed than manufacturing or business concerns in the private sector, then we have to consider why this should be so. Surely it is reasonable to look for the cause in that which is common to public enterprises and distinguishes them from private enterprises—*viz*, ownership and control by the government? Unless we presume that managers in public enterprises as a rule are inferior to managers in the private sector (and there seems to be no warrant for such a presumption, even though salary levels in the public sector in many developing countries are lower than those in the private sector), we have to examine the factors which tend to depress managerial performance in public enterprises, such as a lack of clarity (and changes) in regard to goals and objectives, inadequate autonomy, the erosion of such autonomy as is nominally granted through excessive bureaucratic interference and intervention, too minute an overseeing by the legislature (and sometimes improper interferences by politicians), accountability concepts and procedures which are preoccupied more with process than with the result, more with isolated action and decisions than with the over-all achievement of assigned tasks, and a negative attitude on the part of agencies and authorities enforcing accountability which inhibits or even paralyses managerial decision-making and executive action. Contrariwise, we must also take note of the fact that the threat of collapse which imposes a salutary discipline on the private sector is absent in the public sector, as public enterprises are rarely if ever allowed to die; that they have (inspite of governmental procedures and delays) an easier access to investment resources than units in the private sector (and consequently a weaker motivation for economising on their use) and that if they face liquidity problems governments sooner or later help them out. On the personnel front, public enterprise managers usually do not have the same incentives or disincentives as those in the private sector; if they do very well they are not necessarily rewarded, and if they do badly, they do not face severe consequences (though if they take an action or decision of doubtful propriety or procedural correctness, they do face unpleasant consequences even if their over-all record of performance is good).

It may be argued that the preceding paragraph in fact amounts to an enumeration of factors which are common to all public enterprises and which distinguish them as a class from private sector units. Yes indeed, but this does not prove the existence of an entity called "Public Enterprise Sector Ltd" which can be evaluated, as will be clear from the following.

First, in spite of these common factors (which do not impinge with the same intensity in all cases) there is a wide range of enterprise-specific factors and problems. In some cases changes in top management personnel may be called for; in others, the enterprises may need consultancy assistance in regard to technological or marketing or personnel problems; a few may need changes in product mix or supplementary investments; some may be struggling with difficult and intractable problems of a long-term nature and may need relief by way of debt-rescheduling or tax concessions; and some may be beyond redemption and may have to be closed down. The enumeration of such possibilities can go on, but the point is clear; any evaluation of the performance of public enterprises has to be done at the enterprise level. There is no such thing as the evaluation of the public enterprise sector as a whole.

Secondly, when an analyst projects figures and relationships such as "return on capital" or "debt-equity", "inventory-turnover" or "capital-output" ratios for all public enterprises together, he is misleading himself and others by a false analogy. These are measures of managerial performance which can be applied only at the corporate level of individual enterprises, and cannot be extended to a mythical corporate entity comprising the totality of public enterprises.

Thirdly, while it is entirely natural and appropriate that both the national planning organisation and the finance ministry should be concerned at the relatively low level of return on the total investment up-to-date in public enterprises, and the aggregate figure is not without significance



It is just right
for those
who think big too.
Uttar Pradesh

**SETTING UP INDUSTRY IN UTTAR PRADESH IS NOT JUST FOR THE BIG NAMES**

It is true that some of the biggest names in Indian industry are setting up projects in Uttar Pradesh. Yet the industrial opportunities of the state are just right for medium scale entrepreneurs who want to grow big too. And examples are plenty.

Indian Communication Network promoted in UP by a group of executives with a small capital is today one of the most popular manufacturers of electronic typewriters and office systems. Harig India of UP, also with a modest a beginning, is today setting up a Rs. 15 crore Automotive Crankshafts project. Transtel Pvt. Ltd., established as a small transformer assembly unit has recently commissioned a Rs. 3 crore paper project. The reasons behind these success stories are many.

**HUGE POWER POTENTIAL**

UP has an excellent scenario for power availability. With giant State power generation projects at Anpara, Parichcha, Tanda, Maneri Bhali, Unchahar, etc. gradually reaching full generation. As well as UP's share in Central Sector power projects like Narora. Singrauli and Rihand. So that UP's power availability is steadily growing at more than 17% per annum, and the industrial sector will have a power surplus by mid-1985. Even today there are no scheduled industrial power cuts and new units are assured of no power demand cuts for 5 years.

**THE LARGEST LABOUR FORCE**

UP has the largest traditionally skilled and most peaceful labour force in the country — easily adaptable to precision work. Labour unrest is rapidly on the wane. A traditional cosmopolitan culture precludes communalism and parochial feelings.

**THE MOST ATTRACTIVE "BACKWARD AREAS"**

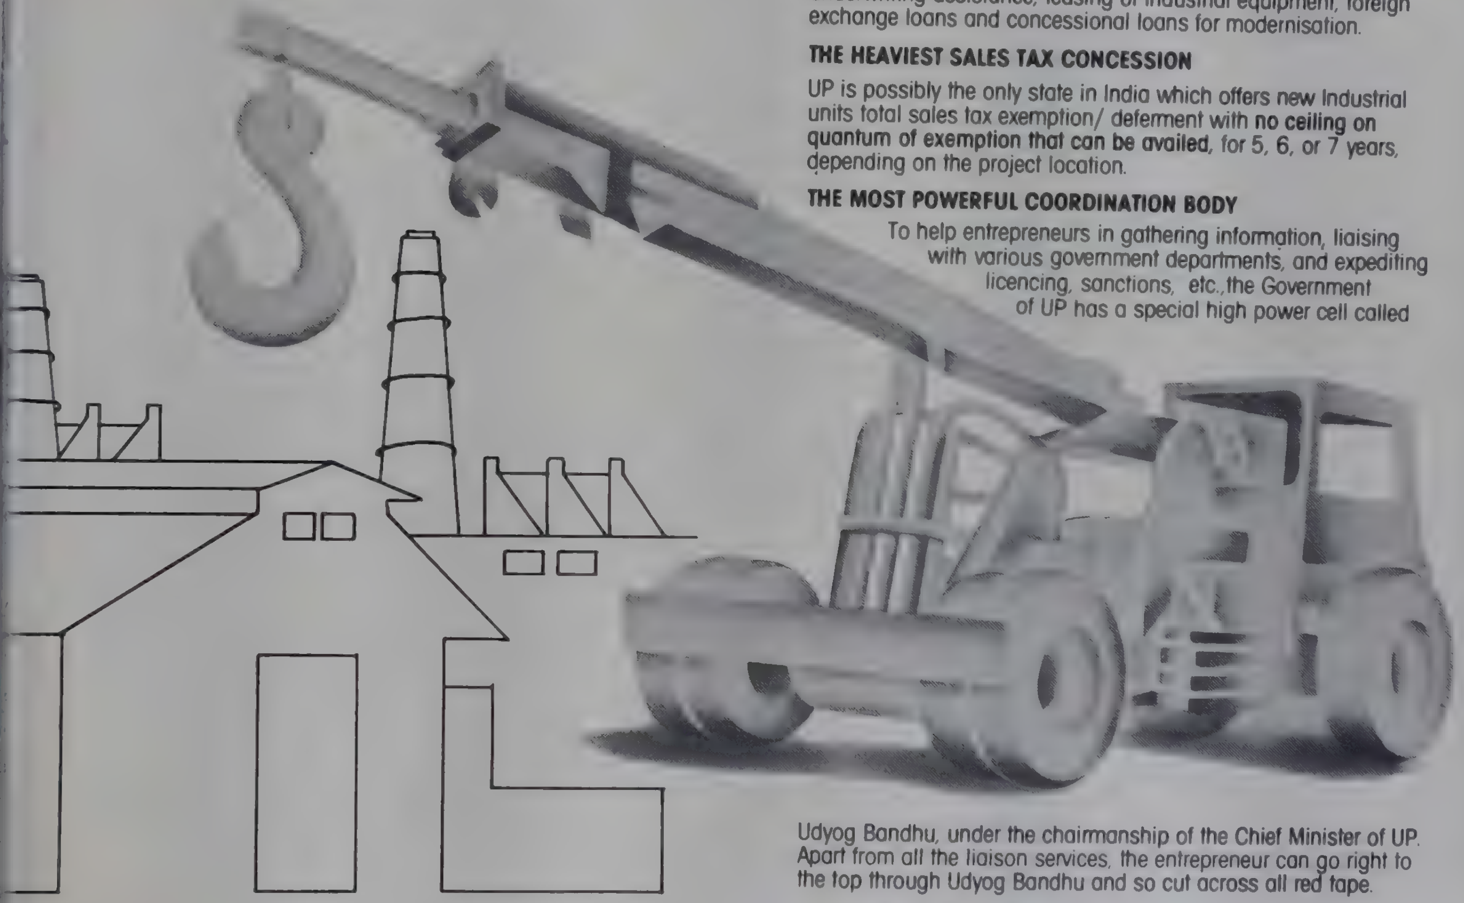
There are as many as 43 districts eligible for Backward Area concessions in UP. But even the 15 Category A (most backward) districts include areas like Kanpur Rural, Dehra Dun, Nainital, Sultanpur (adjoining Lucknow), Jaunpur (adjoining Varanasi) and Fatehpur (adjoining Allahabad/Kanpur). Districts with developed infrastructure like trunk railways, national highways and convenient air connections. Industries in these Category A districts are eligibie for Central Capital Subsidy of 25% of capital investment, subject to a ceiling of Rs.25 lakhs. Subsidy that can be clubbed with the promoter's equity for determining equity : debt ratio. To enable larger loans with promoter's contribution as low as 10% of project cost. Financial facilities include liberal term loans, seed capital, underwriting assistance, leasing of industrial equipment, foreign exchange loans and concessional loans for modernisation.

**THE HEAVIEST SALES TAX CONCESSION**

UP is possibly the only state in India which offers new Industrial units total sales tax exemption/ deferment with **no ceiling on quantum of exemption that can be availed,** for 5, 6, or 7 years, depending on the project location.

**THE MOST POWERFUL COORDINATION BODY**

To help entrepreneurs in gathering information, liaising with various government departments, and expediting licencing, sanctions, etc.,the Government of UP has a special high power cell called Udyog Bandhu, under the chairmanship of the Chief Minister of UP. Apart from all the liaison services, the entrepreneur can go right to the top through Udyog Bandhu and so cut across all red tape.



**THOSE WHO ARE MOVING TO UP**

● Modi Xerox ● Bharat Gears ● TELCO ● DCM-Toyota ● TEXMACO ● Lohia-Piaggio ● Escorts- Yamaha ● Wheels India ● Phillips Carbon Black ● Ceat Tyres ● Century Pulp and paper ● Bajaj Auto ● Hindustan Motors ● Orient General Industries ● Hindustan Brown Boveri ● Gulf Consolidated Company for Services and Industries of Bahrain ● HMT ● BHEL ● Bharat Electronics ● Hindustan Aeronautics ● Indian Telephone Industries ..... to name only a few.

For further details of industrial opportunities and facilities, do get in touch with us at

**THE PRADESHIYA INDUSTRIAL AND INVESTMENT CORPORATION OF UP LTD.**
Jawahar Bhawan (Annexe), 2nd Floor, Ashok Marg,
Lucknow 226 001.

**UDYOG BANDHU**
Nav Chetan Kendra,10, Ashok Marg, Lucknow 226 001.

**PICUP** **UDYOG BANDHU**

Big things are happening in Uttar Pradesh.

ULKA-D-PICUP-1172/3

in this context, the over-all deficit or low return is merely an indication that all is not well and that the matter needs to be looked into; for any actual evaluation we must look at the performance of individual enterprises. An aggregate positive return may conceal very large losses on the part of individual enterprises and encourage complacency; and an aggregate negative return (or low positive return) may obscure large profits made by particular enterprises and may tend to promote adverse judgments on public enterprises in general, demoralising even the successful ones.

## VI

But surely (it may be argued), despite all those qualifications and reservations it cannot be denied that macro-economic analyses will provide useful material for policy reviews and decisions by governments? It would be foolish to deny self-evident propositions: we are always better off with information than without, and decisions are always better if based on analyses rather than on hunches. However, what we are considering here is not governmental macro-economic policy-making in general, but specifically policy reviews and decisions in relation to public enterprises. What kinds of decisions are these? The following are some which come to mind:

(i) reviews of pricing policy and a consideration of enhancement or of release from restraint—in those cases in which the prices of the output of public enterprises have been kept depressed by governmental action;

(ii) reviews of subsidisation levels, and a consideration of enhancement, reduction or elimination;

(iii) reviews of governmental policies in regard to modalities of project implementation (such as the maximum utilisation of indigenous engineering, equipment supply and project management capabilities, or the allocation of packages of foreign exchange from certain easily available aid sources even if this means buying know-how and equipment not of the best), if it has come to be felt that these have led to time- and cost-over-runs and need to be subordinated to the over-riding need to ensure project completion within the approved cost and time-schedule;

(iv) an examination of the manner in which the governmental machinery impinges on the performance of public enterprises and a reappraisal and re-ordering of the relationship between the government and pubic enterprises;

(v) a review of personnel policies in relation to the top management of public enterprises—the selection processes, tenures, remuneration levels—and of the structure and composition of the boards of directors;

(vi) the establishment or improvement of systems for the monitoring and evaluation of the performance of public enterprises.

The list can be extended, but that should be adequate by way of illustration. It will be seen that it involves a mix of economic, public administration and management issues; but which of these require a macro-economic analysis of "the public enterprise sector"? Pricing and subsidisation policies certainly need to be considered with reference to their macro-economic—or shall we just say "economic"?—effects, but these have to be considered specifically in relation to particular industries or commodities—say, steel pricing or fertiliser subsidisation or power tariffs. Each of these is a major separate exercise requiring economic analyses—but none of them involves a reference to a postulated "public enterprise sector".

Governments in mixed economies may also wish to consider or re-consider their policies in regard to public investment or disinvestment, the place assigned to public enterprises in their development strategies and the proper mix of public and private sectors. In this context, information regarding the share of public enterprises in the national output or investment, or in the output or investment in particular industries, will certainly be useful; but even here the importance of such macro-economic magnitudes and relationships should not be over-stated. Questions such as whether there should be further public investment in a particular industry, or whether one or more existing public enterprises should be partly or wholly thrown open to private ownership, or whether private investment may be allowed in an area earlier reserved exclusively for the public sector, are usually considered by governments partly with reference to ideological considerations; partly in the light of their knowledge of the nature and composition of the private sector groups in the industries in question and the exercise (actual or potential) of politico-economic power by them, and their (the governments') perceptions of the consequences of allowing further private investment in these areas; and partly with reference to the resource constraints and the desirability of leaving some investments to be undertaken in the private sector, financed at least in part by recourse to resources which are supplementary to those available to the government. In considering whether in a given area—say the steel industry or the fertiliser industry—public enterprises have reached a "commanding" or at least influential position, and whether the field could be left to private investment for the time being, governments may indeed take note of the fact that public enterprises account for a certain percentage of the output or investment in that industry, but they are likely to be guided to a much greater extent by their direct knowledge of the facts and circumstances of the industry.

Governments are also likely to be guided by the consideration that a large and growing body of public enterprises makes enormous demands on the available pool of technological and managerial manpower resources and imposes severe strains on the government's own administrative machinery by way of onerous responsibilities for co-ordination, monitoring, control and evaluation. Considering the severe (financial) resource crunch, the difficulty of finding competent managers to run public enterprises, and the still greater difficulty of equipping the supervising ministries with the necessary monitoring capabilities, there is a great deal to be said for keeping the public sector within manageable limits and leaving as much as can be safely left to the entrepreneurial, resource-raising and managerial capabilities of the private sector. This is another "policy" aspect likely to engage the attention of governments in developing countries—those which believe in a mixed economy and envisage a role for the private sector. This again is a fairly obvious proposition (except to those ideologically committed to the exclusive instrumentality of public enterprises for socio-economic development) which is likely to be valid for most developing countries: there is hardly any developing country which does not face a resource crunch or in which the available managerial/administrative capabilities are not under a strain. This caution against an over-extension of either governmental or public-enterprise bureaucracies need not be arrived at through the route of macro-economic analysis.

Governments also need to review from time to time the operation of the usual tools of economic regulation and administration, such as systems of industrial approvals, statutory price controls, import control regimes, exchange control and exchange rate policies, etc; but these are questions of general economic policy and strategy, and not specially questions relating to public enterprises.

## VII

It is time to gather the different strands of the argument together.

(i) The importance of macro-economic analyses for a consideration of economic policy issues by governments, and for the planning exercises of the body responsible for national planning, is self-evident. However, the stress on "macro-economic studies of the public enterprise sector" arises out of a mixture of legitimate concern, conceptual confusion and ideological bias.

(ii) It is certainly true that many public enterprises make heavy drafts on the national Budget and are a drag on the economies in question. It is also evident that in general the return on the total investment in public enterprises made by many developing countries has been low, causing concern to both the planners and the finance ministries. But the low returns on investments in public enterprises in the aggregate and the large losses of individual enterprises are evident enough without macro-economic studies.

(iii) Further, such macro-economic studies relating to public enterprises are of limited value, as they can give us mainly an idea of the size and extent of the public enterprise presence in an economy or in an industry, and of the total surpluses or deficits generated by all public enterprises together (and both these kinds of information can be arrived at through the aggregation of enterprise-level figures without macro-economic studies or the disaggregation of national accounts).

(iv) Macro-economic magnitudes and relationships (such as the share of public enterprises in national output or investment), while useful from the planners' and the Budget-makers' points of view, cannot tell us much about the role or roles assigned to or played by public enterprises in socio-economic development or the place occupied by them in the national life: that kind of understanding of public enterprises can only be derived from detailed studies of the evolution and position of individual enterprises.

(v) Nor can macro-economic studies assist in the evaluation of the performance of public enterprises, which has necessarily to be done separately for each enterprise; there is no such corporate entity as "Public Enterprise Sector" mediating between governments on the one hand and individual enterprises on the other, with a performance of its own which can be evaluated. Any aggregations of figures for public enterprises as a whole can be very misleading, as (a) by implication it assumes the existence of an entity consisting of the totality of public enterprises; and (b) by offsetting the losses of some and the profits of others it obscures the performance of individual enterprises.

(vi) Efforts to improve the performance of public enterprises have to be directed at individual enterprises, and have to consider problems specific to particular enterprises or affecting groups of enterprises; at the same time governments have to undertake an examination of the manner in which their own administrative machinery impinges on the performance of public enterprises. The postulation of a concept of "Public Enterprise Sector" with a macro-economic "impact" tends to divert attention both from enterprise-specific problems and from the responsibility that governments themselves bear for the performance of public enterprises in general.

(vii) Governments certainly need economic analyses as the basis for policy decisions of diverse kinds but that is a general proposition relating to all economic policy-making and planning. Specifically in relation to public enterprises, governments may have to consider questions of pricing policy, levels of subsidisation, policies in regard to the approach to project implementation, etc. Each such question has to be separately considered with due regard to the economic and other consequences of different policy options. Many of these questions are enterprise-specific or relate to particular groups of enterprises or industries, and few of them call for macro-economic studies of "the public enterprise sector". As for a review of the government's relationship with public enterprises and of the factors which affect managerial performance, such as excessive bureaucratic interference, counter-productive accountability concepts and procedures, etc, these belong to the fields of public administration and management; and the general perception that public enterprises are hampered by inadequate autonomy and the impact of the governmental machinery does not need macro-economic analyses.

(viii) Macro-economic magnitudes and relationships such as share of public enterprises in the national output/investment or in the output/investment in particular fields of industries, may be of some use when governments begin to consider the size and spread of the public enterprise presence, the public-private mix in specific areas, and the desirability and feasibility of changes; but even here the decisions are likely to be governed much more by general socio-political considerations and a direct knowledge of the facts and circumstances of particular industries (including the presence of large private groups or of transnationals and the extent of influence wielded by them) than by macro-economic percentages.

(ix) As for the general proposition that governments should keep the growth of public enterprises, and indeed of the public sector in general (including departmental operations and agencies) within manageable and monitorable limits, this is valid for most countries, and is a self-evident proposition which does not need to be—and cannot be—derived from macro-economic studies of "the public enterprise sector".

(x) The recommendation to undertake "macro-economic analyses of the public enterprise sector" arises essentially from a concern at budgetary deficits and balance of payments problems—a concern which is legitimate, but is often accompanied by a discomfort with all state intervention in the economy, including the establishment of public enterprises. Recommendations for "macro-economic studies of the public enterprise sector" are often in effect recommendations for studies of state intervention.

## VIII

Two kinds of misreadings of this paper are possible. The first is that the paper is anti-macro-economics, and that the writer has a non-specialist's hostility to a specialist discipline; the second is that the paper is an apologia for public enterprises. There is really no room for either misreading, and a careful look at the paper will dispel such wrong impressions.

A possible response to the paper on the part of some may be to say: "Yes indeed, we are talking about state intervention; when we refer to the macro-economic impact of the public enterprise sector, we are quite aware that we are talking about the impact of state interventionism. We do want to draw people's attention to this". But if state intervention is what one has in mind, why not say so? Why refer to "the public enterprise sector"? Moreover, all states intervene in the economy and in a number of ways; it is impossible to cost the whole of state interventionism. What one can do is to cost each particular policy or act of interventionism—particular subsidies or price controls, specific public investment decisions, etc. To talk of "state interventionism" as a whole and its "impact", or "the impact of the public enterprise sector", is to assume tacitly that state intervention and public investments are deviations from the "norm".

It can of course be argued that the expression "the public enterprise sector" is a reference to state interventionism of a particular kind, i e, intervention through public investments and the instrumentality of public enterprises; and that there are other and better means of intervention available, such as incentives/disincentives through credit and taxation policies, guiding or controlling private sector activity through direct controls or indirectly through various mechanisms, etc. However, as already mentioned, the case for less direct public investment and for greater recourse to other forms of intervention (direct or indirect), could well be urged on the basis of considerations such as the need to minimise the draft on the budget, to avoid over-straining the managerial and monitoring capabilities available in public enterprises and in the governmental system and to make full use of the energy, initiative, financial resources and man-power and managerial capabilities available in the private sector in the cause of national development: this does not require macro-economic studies of the public enterprise sector.

It is rather puzzling to find even economists from socialist countries urging the undertaking of macro-economic studies of the public enterprise sector. One can only suppose that they have allowed themselves to be persuaded by the advocacy of those who are basically unenthusiastic about both state intervention and public enterprises. Perhaps a shared professional interest in the potentialities of the discipline and the capabilities that certain techniques and methodologies seem to promise, tends to blur the perception of attitudinal differences.

Faced with sub-optimal performance by public enterprises and the strains which this imposes on the national plan and the Budget, we can either consider how best that performance can be improved, or assume that public enterprises as a class are bound to be less efficient than private enterprises and recommend privatisation. Those who have no doctrinal discomfort with the notion of public enterprises will take the first course; and those who believe that the market is the norm and that any deviation from it (including the advent of the state into business) is a "distortion", will tend towards the second course. That is of course too sharp a contrast. The first group (i e, those who believe in a mixed economy) could be mindful of the need to keep the growth of public enterprises within manageable and monitorable limits, to conserve scarce financial and managerial resources for important purposes and activities, and to shed public investments of no great consequence (for instance, in hotels or bakeries or shoe-manufacture or contraceptive plants—but such illustrations are fraught with risk: each one of these could conceivably be of strategic importance in national planning in certain countries under certain circumstances). The second group (i e, those who basically believe in free market economies and minimum state intervention) could also be realistic enough to accept the position assigned to public enterprises in the strategies of many developing countries, and to concede that ways and means must be found to improve the performance of public enterprises while keeping them public, and that privatisation can at best be a remedy of the last resort, to be applied only in a very limited number of cases. In terms of practical recommendations in a given situation the two groups may possibly find themselves in agreement. And yet, a difference in attitude and bias remains; and it is this which becomes evident in the terms in which "the macro-economic analysis of the public enterprise sector" is advocated by some.

# Managerial Trade Unions

**E A Ramaswamy**

*Managers and officers are increasingly banding themselves into collectivities of associations which are gaining the aspect of trade unionism. This paper seeks to present the extent of this phenomenon, the underlying factors responsible for it, the problem of recognition and the associations' response, union-association relations and likely trends in the future.*

THE Indian manager is getting collectivised. Managers and officers from such diverse organisations as manufacturing enterprises, commercial banks, insurance companies, non-banking financial institutions, research and development laboratories, electricity boards, trading corporations, the merchant navy and the civil service are banding into collectivities which are gaining the aspect of trade unionism, The word 'manager' is not the only possible label for this diverse group of people. Industry employs managers; the civil service and merchant navy have officers, as do the banks and insurance companies; research institutes and laboratories employ scientists and technologists; and engineer is probably the right appellation when it comes to electricity boards and sections of commercial airlines. Although called by different names and doing varied jobs, it is quite clear that these men and women have a great deal in common. They belong to the higher echelons of the organisational hierarchy where they are expected to bring knowledge and discretion to the job. They are as different from white collar groups such as clerks, draughtsmen, technicians, salesmen and laboratory assistants whose tasks are routine and repetitive, although non-manual, as from the blue collar which is paid for the exertion of physical effort. The label given to this diverse group by the ILO is 'professional worker'. Peter Drucker refers to them as knowledge workers. The people in question often call themselves officers, especially in India. We may simply title them managers. Our calling them managers will not set definitional controversies at rest. While the core of the category may be clear, there is much room for debate at the periphery as to who is included or excluded. However, there is no need to be hamstrung by definitional problems which this essay does not seek to resolve.

There is a semantic problem concerning the label for the collectivity as well, although this is more readily disposed of. Typically, managers prefer to think of themselves as belonging to associations rather than trade unions. Officers' associations is, in fact, the popular nomenclature in this country. The claimed difference between associations and unions does not lie in their ends since they both exist to protect and advance the work interests of their members. The difference lies in the means. Whereas trade unions aggressively demand, the associations with their solid roots in middle class values set out preferring the method of representation. Managers, have, however, been forced by the ineffectiveness of this method to bargain in the manner of trade unionists. With the exception of groups such as civil servants who are bound by civil service conduct rules, it is difficult to discern fundamental differences in the *modus operandi* of unions and associations. Even though managers may not replicate all the methods of their workmen, the difference between the two is one of degree than of kind. The phenomenon that we have is managerial trade unionism. Strictly speaking, the terms 'association' and 'trade union' can be used synonymously. However, we will refer to combinations of managers as associations so that they are readily marked off from combinations of workmen.

Given the present state of knowledge, it is impossible to estimate with any precision the spread or density of managerial unions. Organisations of managers appear to have been in existence for decades, with associations of merchant navy officers, airline pilots and flight engineers dating back to the period around Independence. Civil servants have similarly been organised for a long time. The early associations were, however, quite different from their later-day counterparts. They were concerned with the advancement of professional interests, mutual benefit and welfare, scarcely ever bargaining the terms and conditions of employment. Thus, while associations may be said to have existed for long, they are certainly an emerging phenomenon in their present form as bargaining agents.

The proliferation of associations and the transformation in their character owe much to the rapid growth in the ranks of middle managers since the sixties. The phenomenal expansion in banking and insurance and the massive investments in public sector enterprise caused a spurt in their numbers. Growing numbers created the need for organisation while simultaneously providing the critical mass for viable formations. Bank officers pioneered by the State Bank of India have been in the forefront of this new wave. There is almost no public sector enterprise today whose managers are not organised. The steel plants; coal mines; petroleum refineries; rail, road, sea and air transport undertakings; manufacturing enterprises in engineering, chemicals, textiles, electronics and fertiliser; the entire banking and insurance industry; the many finance corporations established to induce industrial growth and recovery—in fact, the entire gamut of organisational activity—has come under the influence of the associations.

Contrary to popular impression, the private sector has not escaped the sweep of organising effort although it would be true to say that associations are less pervasive in the private than in the public sector. Associations have existed in the foreign oil companies long before they were nationalised. The best known and best-paying multinational enterprises in the field of pharmaceuticals, engineering chemicals and consumer products are organised. The list includes such firms as Glaxo, Pfizer, Guest Keen Williams, Indian Tobacco, General Electric, Metal Box and Indian Oxygen, to name only a few. Several large family-controlled enterprises are organised as well, instances of this being Tata Electric, Gwalior Rayon, Kamani and the Mafatlal group of companies. There also exist federations of managers' associations, the more prominent ones being the All India Confederation of Bank Officers' Organisations (AICOBOO), the All India Centre of Officers' Organisations (AICO), Steel Executives Federation of India (SEFI) and All India Power Engineers' Federation.

It would be hazardous to guess the number of associations or their membership. One estimate from the managers' movement places the number in the corporate sector at two hundred and their membership at 300,000.[1] This appears a reasonable guess, considering that several associations have a membership that would be the envy of many a blue collar union. The SEFI has 18,000 members and its counterpart in coal has even more. The associations in the Employees Provident Fund Organisation (EPFO) and Employees State Insurance Corporation (ESIC) have over 12,000 members. The banks and electricity boards which are excluded from this estimate would undoubtedly swell the numbers further. Both the sectors are highly organised, and the State Bank

Officers' Association (SBOA) alone has 40,000 members.

No less problematic than the extensity of organisation is the determination of the limits of association membership, or the boundaries of association constituency. At the base, associations take up from where white collar clerical and staff unions stop. At the apex they would evidently leave out the top layer of managers who may not join, or be acceptable to the associations. What lies in between these two points is association territory. While this manner of drawing the boundaries may be all right at a broad level of generality, vast differences can be discerned between different kinds of organisations, or even different enterprises in the same industry, if we get down to specifics.

The common pattern is a three-tier system where the blue collar have their union, the lower white collar comprising clerks, stenographers, office assistants, accountants, draughtsmen and such others have their union/association, and managers and officers have their own exclusive forum. But two-tier systems where the white collar staff team up with managers, as in some banks, or with the blue collar, also exist. What is uncommon is for the blue collar and managers to span the vast chasm separating them. A further source of variation comes from groups which straddle the dividing line between managers and white collar staff such as supervisors, secretaries and accountants. They commonly constitute the top crust of the staff union, but in a rare case they may make up the base of the managerial association.

At the apex the reach of the association varies from one organisation to another. In the commercial banks, association membership normally stops at the Regional Manager, which is a middle management position. Officers of the level of Assistant or Deputy General Manager would normally keep out, although a stray activist may retain his link with the association even after elevation to these ranks. Membership extends a little further in the Life Insurance Corporation where Zonal Managers are also organised. The steel plants and coal mines probably represent the ultimate, with association membership reaching right upto the level of General Manager. In the same category belong to ESIC and EPFO where a mere half-a-dozen managers in a total force of nearly 13,000 have stayed out of the association. The only discernable pattern at this level is for association membership to reach further in the hierarchy in the public than in the private sector. Even this constant is not without qualification. In a private sector power distribution company only eight managers out of a total of 300 remain outside, which is quite unusual for this sector. There is thus infinite variety with regard to both the floor and ceiling of association membership, making it hard to generalise.

### WHY MANAGERIAL UNIONS?

The common reaction to the growing collectivisation of managers is one of disbelief and puzzlement. Trade unionism evokes strong negative reactions among those charged with managing protest. After a century of existence, unions continue to be viewed as a disruptive force with little positive purpose. The top echelons of industry are perplexed that managers who make up the steel frame of the organisation should emulate their blue and white collar subordinates. Why should managers with a strong tradition of individual advancement, and aversion to trade union methods, feel the need to collectivise? The search for an explanation has taken bizarre directions. Some wishfully hope that their purpose, especially in the public sector, is to increase productivity, improve efficiency and function as the watchdog of the public interest. Yet others believe them to be cultural organisations, mutual benefit societies or harmless welfare oriented collectivities. That managers could be collectivising to grind the sectional economic and political axe, is rarely conceded. The frequently advanced argument is that it cannot be their intent to bargain, for whom will they bargin with? How can managers organise against themselves? Would they not suffer loss of credibility before workers if their own methods are no different from those of the latter? Would they not be hurting themselves rather than their bosses by choosing the path of conflict?

These views find expression in formal utterances by top managers as well as in their everyday interaction with the associations. Consider, for example, the expectations the Managing Director of a public sector firm has of the associations: "If officers' associations come forward to help the management improve performance and reduce problems, well, they ought to be accepted and even encouraged. When people organise into a group, the group possesses kinetic energy which can be put to use either for benefit or for destruction. My experience and interaction tell me that the leaders of the association are for constructive work like productivity improvement, quality assurance and fulfilling social obligations ... In fact, we can think of a score of other ways of putting the associations to use. We can give them assignments in various fields including manpower planning, feasibility assessment for new products, etc. We may use them to prop up our position in delicate matters with the Bureau of Public Enterprises and the government. All we have to do is to let them share some of our responsibilities, for which they seem so eager."[2]

The expectation that the associations would not, or should not, pursue sectional interests is carried to the realm of everyday interaction. In the words of a senior official of the managers' movement: "Today most of the associations have not been accorded official recognition. They are being meted out treatment once given to the pioneers of the trade union movement. There have been cases of victimisation resulting in the termination of service of office bearers in a few organisations, including the state-owned HAL and BHEL. Even the organisations which are willing to grant recognition insist that officers' associations must behave only as officers' clubs and that their constitution must be so written. They are not prepared to accept the associations on the same footing as the trade unions. Today the associations think of themselves as different from trade unions. But if the government and management continue to be intolerant, it is only a matter of time before the associations become trade unions."[3]

Managers unionise for much the same reasons as anybody else. Trade unions of managers have an essential and striking similarity with those of the blue and white collar. This contention will be amply borne out by the discussion that is to follow. To place matters in the right perspective, however, we shall first consider the situation in the industrialised west where managers have for long been organised.

A study of managerial unionism in eleven European countries by the European Association of Personnel Management offers a good base for building our arguments.[4] Like their counterparts elsewhere, European managers had traditionally thought of themselves as having a special relationship with the employer. As individuals they had easy access to the top functionaries of the organisation. The growth in the size of organisations, the vast increase in the numbers of managers and growing bureaucratisation put an end to that special relationship. Managers began to be administered as a group, but not in the total sense of the term. In other words, they had lost their identity as individuals but without the countervailing advantage of the power flowing from a group. As a result, "manual workers had, through their formal systems of representation, more direct and comprehensive access to the top management than they had themselves".[5] The resulting information rationing and information starvation put the manager at a serious disadvantage with regard to workers, and ushered in the era of the "managerial production line".[6] Some commentators go so far as to say that the consequence of these forces has been to reduce managers to a "technologically deprived, emasculated, disenfranchised and a relatively disadvantaged section of the employee population".[7] It was only natural that managers should redress the situation by organising themselves and wresting as a collectivity what they had lost as individuals.

The managers' desire for formalised say as a collectivity in the affairs of the organisation, while present in almost every situation, is especially pronounced where workers have gained wide-ranging participatory rights. The example of West Germany where co-determination has vested the workers with such rights is especially striking. Hartmann observes:

> Foremost among the issue mentioned by our respondents (in a survey of 305 'executive-grade' employees) was ... participation. Considering that the interviewees belong to levels presumably well endowed with powers of decision-making, the extent of such interest in participation must seem surprising; 87 per cent of our informants said they were concerned with "more participation", and no other issues were backed so widely ... Participation referred to all conceivable linkages to the decision-making process; for information to consultation and joint deliberation ... We infer that they consider more participation desirable because other groups have won formal representation—and therefore it is now their own due.[8]

Narrowing differentials are another source of concern to managers. The common experience in several European countries, especially those with a poor growth rate, is that blue and white collar categories gain significant pay increases through collective bargaining whereas the managers do not get matching benefits. Differentials have therefore narrowed. In addition, rapid changes in technology have caused in managers a sense of job insecurity. Workers are insecure as well, but their unions at least fight redundancies tooth and nail.

Managers with specialist professional qualifications, such as engineers, technologists and scientists, are also dismayed to find their career advancement blocked by generalists. It cuts the scientists and technologists to find that plum positions in specialist organisations are captured by generalists who are no more than mere administrators. One of the major platforms of the Institution of Professional Civil Servants in England—which, behind its misleading name, is really a trade union of professionals in government employment—is that specialists should have an equal share of the top jobs. The IPCS observed as early as 1929: "Who can expect the classical scholars who control the civil service to have a change of outlook and recognise the strengths of scientists and those with a professional and technical training?"[9] This observation still rings true, especially in this country where the generalists and specialists have been fighting a running battle. There is no doubt that myriads of engineers and scientists in such specialist organisations as the electricity boards and the Oil and Natural Gas Commission will strongly empathise with the IPCS. As an engineer from the ONGC acidly remarked: "The only organisation which generalist administrators have not so far headed is the Directorate General of Health Services!"

It will be seen that every pressure for collectivisation emanates from within the work organisation. Managers see in trade unionism the means of shoring up sagging differentials, fighting job insecurity and balancing the growing power of workers. In contrast, wider social considerations are strongly arranged against managers banding together. The social background of managers disapproves of the general ethos of trade unionism and the political ideology associated with unions. "They are presented with a conflict between what is industrially expedient and that which is socially permissible."[10] Managers are reluctant militants, creatures of circumstances forced to attribute greater salience to workplace considerations than social forces. As Fox perceptively observes, the view that managers would not collectivise to protect their work interests is not a natural law but a mere social convention.[11]

If we step back in time, it would be seen that the reasons adduced for unionisation by managers are not entirely unique to this category of personnel. Much the same reasons explain why white collar groups organised. White collar employees thought of themselves as having a special relationship with the employer, till that vanished with growing numbers and greater impersonalisation. In similar fashion, white collar work was perceived as skilled, allowing the individual considerable flexibility and freedom. It is now universally accepted that white collar jobs have become de-skilled, to use a phrase made famous by Braverman. Consider, for example, the following observation about draughtsmen: "... the design function is becoming increasingly dispersed over a wide range of more specialised jobs, which range from design engineer to production planning. It is extremely rare for the machine to directly take over a draughtsman's role; the demise of the latter is usually accompanied by the creation of several other roles at various levels of expertise but usually demanding skills that are much more specific to the work situation than the more generalised craft accomplishment of the draughtsman."[12] One of the most interesting recent works highlighting the de-skilling of white collar labour is the personal account by a computer programmer of how programming has become routinised and the programmer's work itself severely programmed by the employer.[13] The aura and mystique have gone out of programming and their place taken by monotony and tight control. It is no wonder scholars now routinely speak of white collar *labour* and white collar or clerical *factories*. In the words of one "... the office is now a highly mechanised place and large numbers of clerical jobs can be characterised as feeding paper at one end and collecting it at the other".[14]

Salary differentials have narrowed even as freedom, flexibility and craft skill and pride have evaporated. A great deal of evidence can be mustered to show that the white collar have lost monetarily in absolute terms as well as in relation to the blue collar. And, in common with managers, the white collar too have had problem shedding their inhibitions and taking to the path of trade unionism. As C Wright Mills observes of America: "In the minds of the white collar workers a struggle has been going on between economic reality and anti-union feeling. Whatever their aspirations, white collar people have been pushed by twentieth century facts towards the wage-workers' kind of organised economic life, and slowly their illusions have been moving into closer harmony with the terms of their existence."[15]

Collectivisation to bargain the conditions of employment appears inevitable for any group of employees which experiences impersonality, division of labour, powerlessness and other related attributes inherent in large scale factory and office organisation.

With this backdrop of forces underpinning the organisation of managers, we can now move over to the specifically Indian context. A good peg to hang several coats is offered by a survey of managerial perceptions in a large public sector corporation in the field of high technology manufacturing. The survey itself is somewhat elementary, but it has great significance in that the effort has come from a pro-

Change is permanent

**Change is the essence of growth, an edict of management.**

**And, in today's world, the choice before an organisation is not between 'change' and 'no change', but between managing the change and being managed by events.**

**Change, when consciously imposed from within, opens up new opportunities, new avenues of growth. Paradoxically, the process of change is, and has to be, permanent.**

**This is the philosophy behind the changing role of MMTC — from a mere canalising agency to an international trading house.**

Change, to MMTC, has meant putting its expertise in bulk buying and selling to larger purposes of national growth

Like opening up global markets for India's small scale entrepreneurs. Adopting new strategies like Third country trading, Three-way trade, Joint ventures both in India and abroad, Equity participation abroad in sources of raw materials as well as in basic inputs.

Entering the arena of non-canalised items — ranging from importing PVC resins and mercury to exporting diamonds and graphite electrodes

Improving customer service by decentralising operations, streamlining the distribution system and setting up Customer Service cells.

Reorienting the organisation to meet new challenges — through long-range planning, computerisation, systems reappraisal and organisation restructuring.

And this change already reflects in MMTC's performance. Non-canalised exports registered a fourfold increase in the first half of 1984-85, while the year's turnover is poised for a threefold rise. A record quantity of fertilisers was imported, at the right time, resulting in an all-time high foodgrain production and substantial savings in foreign exchange. Long-term contracts worth millions of dollars have been concluded for iron ore, exports. For the first time, a counter-trade deal has been finalised with Zimbabwe for importing Asbestos against the export of engineering goods — an important step towards diversification and growth.

All this has led to increased employment opportunities which now exceed half a million and generated a new industrial and economic prosperity.

Yes, change is permanent. A philosophy chiselled in the minds of everyone at MMTC, the cornerstone of its success.

fessional researcher but the top management of the enterprise. Alarmed at the declining morale of managers, the management decided to conduct a survey. A questionnaire was administered to a sample of 130 managers out of a total force of over 1,500. We have access only to the tabulated results of the survey and not the raw data, and the responses to some salient questions are given in Table 1.

The results of the survey speak for themselves. For a high technology industry which is constantly updating, the extent of job satisfaction is quite modest. Many highly qualified engineers are engaged in routine jobs and file pushing, and not a few perform tasks more appropriately done by draughtsmen. There is more widespread dissatisfaction with compensation. More than a third of the managers view the top management as bureaucratic and rule-bound, which is perhaps to be expected in the public sector. That twenty of them see the management as autocratic is even more damaging. Only ten per cent find the management willing to participate with their own managers. Not many feel that merit counts for much in the organisation. About half of the respondents say that 'other factors' weigh, which is another way of saying that psychophancy, political jockeying and similar other methods pay. Commenting on this aspect of the survey, one highly placed manager remarked that the organisation had become so large that the top bosses did not really know how their managers were performing. The Managing Director had no personal knowledge even of senior managers.

A fair number feel that they participate in setting the goals of the section or department, but the problem here is that more people feel responsible for goal achievement than claim to participate in goal setting. It is not surprising that the majority find the delegation of powers inadequate. An overwhelming majority is quite clear that the policies of the organisation will not help achieve the goals it has set for itself. That a mere two individuals consider the morale of the managers high eloquently sums up the situation.

In more general terms, managers are troubled by a number of salient issues. The foremost among them appears to be compensation policy. The normal expectation is that the wage/salary pyramid of the organisation should correspond to the status pyramid. This notion has come under such serious threat that many managers feel that there is no compensation pyramid at all. In some cases, a column has replaced a pyramid, meaning that monetary gain accruing from a promotion may at best be marginal. Elsewhere, the pyramid may actually appear inverted, at least with regard to certain categories of personnel. It is far from uncommon for lower and middle managers to earn less than their formal inferious. The Life Insurance Corporation which has for long been famous for subordinates earning more than their superiors is by no means unique.

There has been a sharp increase in blue collar wages in recent times. Aggressive union bargaining has significantly pushed up wages, bonus and fringe benefits. A survey of the wage structure of the pharmaceutical industry in Bombay by the Union Research Group (URG) shows the average monthly wage including allowances, but excluding bonus and overtime, to range between Rs 1,381.95 to 1,933.43.[16] Pharmaceuticals, however, is no longer the best paying industry Bombay, which distinction has now be wrested by chemicals. There are chemi firms in the famous Thane-Belapur b where minimum—not average—wa range around Rs 1,600. The attractive p is accounted for in good measure by t leapfrogging dearness allowance.

Formally bargained benefits tell onl part of the story. Organised overtu which finds no mention in wage contra has emerged as a major additional ben fit. Overtime has long ceased to be method of meeting unforeseen conti gencies. Although the vast variety of ove time practices cannot be gone into he some significant trends merit mentio One prominent development is f workers to absent themselves in a plann and pre-arranged way so as to create ove time opportunities for each other. Ma

TABLE 1

How satisfied are you with the following?

| | Job Content | Remuneration and Perquisi |
|---|---|---|
| Highly satisfied | 40<br>(30.8) | 14<br>(10.8) |
| Just satisfied | 70<br>(53.8) | 80<br>(61.5) |
| Not satisfied | 18<br>(13.8) | 35<br>(26.9) |

How do you view the top management of the company?
(multiple choices permitted)

| | | | |
|---|---|---|---|
| Bureaucratic | 50<br>(38.5) | Professional | 27<br>(20.8) |
| Amateurish | 33<br>(25.4) | Participative | 13<br>(10) |
| Autocratic | 20<br>(15.4) | Innovative | 6<br>(4.6) |

What, in your opinion, contributes to success in this organisation?

| | |
|---|---|
| Performance | 44 (33.8) |
| Seniority | 21 (16.2) |
| Other factors | 64 (49.2) |

Do you feel that delegation of power is adequate to improve your effectiveness?

| Yes | No |
|---|---|
| 56 (43.0) | 69 (53.0) |

How do you view your participation in setting the goals of your section/department and your responsibility for meeting them?

| | Yes | No |
|---|---|---|
| Participate in goal setting | 77<br>(59.2) | 47<br>(36.2) |
| Responsible for goal achievement | 93<br>(71.5) | 22<br>(16.9) |

Do you think that the present policies and procedures of the organisation help in achieving the goals?

| Yes | No |
|---|---|
| 28 (21.5) | 80 (61.5) |

How do you rate the morale of the individual manager?

| High | Fair | Low |
|---|---|---|
| 2 (1.5) | 72 (55.4) | 55 (42.3) |

irms pay four times the normal rate for vorking Sundays and festival holidays. Another practice is to demand overtime 'or performing critical and urgent tasks uch as machinery maintenance and rectiication of breakdowns. In SAIL accouning staff demand overtime for opening and closing of accounts, which is a job hat comes up almost every month. In ome cases workers demand and get overime even when they do not work *over ime*, that is, for completing a job during hift hours. In an extreme case, a worker on casual leave may be paid overtime!

It would be rash to conclude that all vorkers in the organised sector are so generously compensated. Within the organised sector there are enormous variaions between regions, cities, industries or even firms within the same industry. The JRG survey shows that average wages within the same industry can vary by as nuch as 40 per cent. Stretching further, one can show that the very firms which pay top-of-the-shelf wages to their permanent workers pay a measly fraction of the noney to temporary and casual workers loing the same work. Even multinationals re known to operate an entire shift with underpaid casual labour. The point then s not so much that all workers in the rganised sector earn enviable pay ackets, but that there definitely exists a ection in the blue collar labour force vhose earnings are impressive.

The wage skew appears far more serious n the private sector. This may come as a urprise, considering the freedom and lexibility they have to redress this kind of nequity. The reasons for this compensaon distortion are several. There is no oubt that the highest wages for blue ollar work obtain in the private sector. The employer would be quite willing to ay the workers an additional five hunred rupees if he gets increased producvity in return. It is well known that he dramatic wage settlements by Datta amant and R J Mehta extracting subantial monetary benefits are often in the rivate sector, and that these settlements ave equally dramatic productivity auses. In contrast, the public sector, aught in the bureaucratic web of the BPE nd the controlling ministry can offer no nore than a modest raise. Opportunities or overtime, at least of the legitimate ind, also appear to be more widely revalent in the private sector. Because nis sector is careful to avoid overmaning, a lot more opportunities for addional work come the way of workers. The ublic sector with its flabby labour force ffers fewer opportunities. It is of course ue that the private sector compensates its managers better, but the skew remains nevertheless. The complaint of managers often is not so much absolute inequity as relative inequity. They may not be dissatisfied with compensation *per se*, but dislike being paid less than their inferiors.

A simple method of assessing the state of differentials is to examine the data published by companies under Section 217 (2A) of the Companies Act, 1956, as amended by the Companies (Particulars of Employees) Rules, 1975. This law requires firms to publish in their annual report a list of all employees earning more than Rs 36,000 per annum. Remuneration is defined to include wage/salary, bonus, commissions, employers contribution to provident fund, leave travel entitlement and various other kinds of allowances. The number of employees figuring in this list has grown so enormously in some firms that they now publish it as a supplement or pull-out to the annual report. Glaxo Laboratories has 2,100 employees figuring in the list. National Organic Chemicals, although engaged in the process production of chemicals with its advantage of low labour intensity, has a list of 1,026 names. The Andhra Valley Power Supply Company has a list of 917, comprising 97 managers, 349 supervisory staff, and 471 blue collar workers and clerical staff. It would be easy to add to this illustrative list. A feature common to most firms is that a significant number of blue collar workers such as fitters, welders, mechanics, boiler operators, machine operators, drivers, watchmen and even an occasional sanitary worker find inclusion. No less pronounced is the presence of white collar clerical staff such as storekeepers, accountants, stenographers and secretaries. Blue and white collar employees earning impressive salaries have frequently put in several years of work, but rarely have high educational qualifications or technical diplomas. Western India Match Company, for instance, has a large number whose designation is listed as unskilled worker with educational qualifications stated to be unknown.

Table 2 distributes the 644 employees listed in the annual report of a Bombay tyre manufacturer by gross yearly earning and formal status in the hierarchy so as to highlight the kind of skew that can occur. Of the 2,500 blue collar workers, 148 figure in the list. The highest blue collar wage is Rs 63,000 paid to a turner. Some other examples are worth citing. A mechanic earns Rs 62,000; driver Rs 60,000; boiler attendant Rs 58,000; watchman Rs 49,000; helper Rs 48,000; and janitor Rs 47,000. A large number of clerical employees also figure in the list, some earning over Rs 75,000. Many storekeepers, accountants, and timekeepers earn around Rs 55,000. Secretarial salaries range around Rs 60,000. By contrast, many managers at the lower and middle levels with such titles as territory mananger, office manager and operating manager find themselves earning less than drivers, machine operators, storekeepers and secretaries. Some poorly paid managers are young and inexperienced, but this is not always the case. A few examples from among the managers would reinforce the point. A maintenance engineer with an engineering degree and eight years experience earns Rs 58,000. An applications development manager with a master's degree in technology and ten years experience grosses Rs 66,000. A product manager with a bachelor's degree in technology and master's in management earns Rs 70,000 after ten years of work. There are younger shift engineers and in-

TABLE 2: DISTRIBUTION OF EMPLOYEES LISTED UNDER SECTION 217 IN A FIRM BY EARNING AND POSITION IN THE HIERARCHY

| Earning (in Thousands of Rupees) | Blue Collar Workers | Clerical Staff | Lower Management | Middle Management | Top Management | Total |
|---|---|---|---|---|---|---|
| 45-50 | 105 | 34 | 60 | 3 | | 202 |
| 50-55 | 24 | 28 | 45 | 5 | — | 102 |

| Total | 148 | 124 | 234 | 128 | 10 | 644 |

*Notes:* 1 The data pertain to the year 1981.
2 No employee is listed in income range of Rs 36,000-45,000.

dustrial engineers grossing just around Rs 50,000. The inversion of differentials is not unique to this firm. Nor are the cases cited exceptional, dramatic though they may sound. Such instances can be had in abundance in the high wage segments of the organised sector. The general trend is for younger managers to earn less than some of their subordinates. Managers with greater experience may find that the differential is still in their favour, but the edge is so slight as not to count.

There are a few caveats to the figures published in the annual reports. One is that certain reimbursements which are not of a regular or recurrent nature, as for example medical expenses or leave travel find inclusion. This could boost the earnings of some individuals in certain years and distort the picture. The other is that many private sector firms, especially family-owned ones, make cash payments to managers which do not enter the account books. This could be either a regular monthly payment or a once-a-year payment at festival time. It would be impossible to build this income into our calculations for obvious reasons. In private, managers express the view that while cash payments are indeed received they are not such as to redress the wage skew and re-establish the pyramid.

Narrowing differentials have not infrequently contributed directly to association formation. Consider, for example, the experience of a private sector fertiliser plant in South India. The personnel manager narrated how managers reacted to compensation policies: "We bargain a wage settlement with blue collar workers every three years. Whenever the workers bargain a raise, managers are given a few increments to keep up the differential. We slipped on this between 1976-80. Workers bargained two settlements during this period but managers got no benefits because the company was not doing well. As a result, 105 of the 2,000 workers got into the annual report whereas many of the 300 managers found no place in it. Our managers are well paid compared to other firms in the region, but they were losing in relation to the workers. Soon we had an association on our hands."

In some cases the force of the association has been moderated by attacking the problem of differentials. The General Manager of an old British company in Calcutta with varied business interests narrrated their experience: "We have a thousand managers, 600 of them in the middle and junior levels. This group formed an association in 1974. We don't think there is anything wrong in that and we do have a consultating relationship with them. By 1977 we decided to have a close look at their problems. We realised they had a genuine grievance over differentials. The basic wage and salary were all right, but dearness allowance was playing havoc. We promised the association that differentials would be examined and their grievances redressed every five years. There has not been much problem since then. In fact, we no longer see the association as a major force in the organisation."

The strategy of preempting the collectivisation of managers by granting suitable increases to the junior and middle levels is slowly gathering ground. The need to grant such a raise is beginning to figure as an input while considering blue collar demands. In an occasional case association leaders may be asked to be present while bargaining with the union, although there is widespread fear that they would push up blue collar wages in order to help themselves to a larger raise.

The policy of giving a raise to managers without their having to clamour for it has obvious limitations. The ceiling for managerial salaries on the Board of Directors is decided by the government, the present limit being Rs 10,500 per month. The constant upward revision of lower and middle management salaries could bring them close to the top management who are pegged to the ceiling and create a problem of differentials at this level. Moreover, it is only the private sector which has some freedom of action with regard to managerial salaries. The public sector with its centralised decision-making and considerations of parity with civil servants permits little elbow room to the top brass of the individual enterprise. Finally, the ability to pay is not judged in the abstract. Within broad limits, the determination of the precise quantum of payment is a function of the pressures brought upon those who take the decision. So long as this is so, different yardsticks are bound to be applied to the determination of workers' wages and managers' salaries. Managers may get a balancing raise when business is good. When business is bad, the top brass could still cave in to union pressure and concede a raise but apply the axe on managers. It would be idle to expect that bargaining and non-bargaining groups would be treated alike.

A second major issue after the question of differentials is the perceived need for protection from militant trade unionism. While union power may be felt in the boardroom once in three years, the every-day business of trade unionism between contracts is aimed more at junior and middle managers. They are the ones responsible for the nuts and bolts of industrial relations, translating managerial decisions into action. And it is these managers who are in the direct line of union fire. There is a growing feeling at this level that for the top brass industrial relations are a matter of expediency rather than of well thought out policy. The fifties and sixties saw the management going all out to beat down the unions. In the seventies and eighties they appear to have swung to the other extreme of unprincipled surrender, at least in the eyes of the middle ranks. In this atmosphere, junior managers may be readily cannibalised to make up with the union. Managers lower down the hierarchy are uncertain how to go about dealing with unionised labour. There is in any case no coherent policy to be followed. This style, or the lack of it, is derisively called in some circles as "somehow" management because the only advise that comes forth from seniors is to manage somehow. If the young manager should decide to chargesheet an offender, his boss may drop the charge on grounds of expediency. Laxity on his part might, on the other hand, evoke the comment that he is not sufficiently firm.

A further irritant is the impression that the top management want to convey the 'no' to the trade unions through the middle ranks, but step in and take the credit when the reply is an 'yes'. Workers naturally think that the top management is broadminded and benevolent, and it is the petty officials in between who create all the trouble. The junior manager is made out to be the villain of the piece although he is only acting out his assigned rôle. Overall, the middle ranks of managers seem convinced that they cannot count on support from above with regard to the union even when they have acted in good faith towards the organisation.

The manager of a general insurance company cited a specific instance to argue this point: "The erosion of the power of managers to manage is one of the principal reasons why they organise. One of our senior officers took disciplinary action against a subordinate for gross misconduct. It would have been a crime to let that fellow get away with what he did. But the top management revoked the punishment under union pressure. They pulled up the officer for acting in haste and advised him to be more tactful in future. Our officers want to know what this 'tactful' handling of industrial relations really means. There are no clear instructions. An officer can always be accused of being too harsh or too soft depending on how the boss wants to look at it. This kind of hypocrisy is typical of the top brass in the entire public sector. Our officers felt that the only way they could safeguard themselves was by forming an association. I think they are fully justified."

The common impression in the middle ranks is that evasion is probably the best policy in dealing with organised labour. Even if they follow the beaten track and keep out of controversy, managers at this level may still have to bear the brunt of union wrath in difficult times. Middle managers have been exposed to a great deal of harassment by irate workers when they themselves have not been at fault. Such treatment has been meted out by union members from the entire range of skill spectrum—by white collar groups as well as by the most unskilled of blue collar labourers. In the coal mines managers have been assaulted by organised gangs engaged by mafia-like trade unions. A minor grouse against an individual manager can explode into violence against managers in general. In the banking sector, at the other end, officers have come in for heavy barracking at the hands of the clerical force. In between, industrial workers can go on a spree over poor canteen food, inter-union squabbles, an industrial accident and a host of other reasons. Junior and middle managers offer a ready target of attack because they are the men on the spot who are considered to symbolise the management. The association is seen to offer a measure of protection against such treatment. Bank officers, for instance, hold the need for protection as a salient reason for association formation. Emboldened by the presence of a back-up, bank officers have taken jeering clerks by the scruff of the neck and given back a dose of their own medicine. The general feeling in many sections is that intimidation by the lower ranks has declined because the men know that the manger is not alone.

The idea of workers' participation in management has been in the air at least since the introduction of works committees by the Industrial Disputes Act, 1947. There has been much controversy over whether participation should be allowed to take root through voluntary effort by labour and management or made mandatory by statute. The government periodically threatens to bring forth legislation that would compel employers to adopt the participatory style, sending shivers down the spine at least of private sector management. The nationalised banks and major ports have workers' representatives on the Board of Directors. Those who understand the spirit and substance of participation are generally agreed that the country has not moved beyond the realm of rhetoric. But that the rhetoric is kept at high pitch is beyond question. This strident call for worker participation is not fortuitous, nor is its introduction even in a limited way gratuitous. The workers have established themselves as a force and so everyone is looking for ways to incorporate them into the system. Junior and middle managers feel that the faceless and voiceless entity of the organisation is not the unionised force but themselves. After all, workers do participate even without participatory schemes. Collective bargaining is itself a form of participation, and this right to participate workers already possess in ample measure. The government and the management who are so concerned to further enlarge this quantum scarcely give a thought to the manager's need to participate in management. A management consultant sums up this dualism as stepmotherly discrimination of managers and grandmotherly pampering of workers. An association periodical from the Electronics Corporation of India caricatures this in a cartoon as the two faces of management—smiling and benevolent towards the unions but stern and hostile towards the associations. The lesson that the managers draw is that they need an organisation to focus attention on their problems.

Job security is another major area of discontentment. In the view of managers, unionised workers are virtually assured of lifetime employment. One of the hardest things in Indian industry is to terminate the services of a worker. Even if the management go ahead with the dismissal in the face of union pressure, the chances are that a court of law will order reinstatment. Having used bargaining power to secure their own employment, workers are now demanding preferential recruitment of their children. Many enterprises offer employment to one child or near-relative of a retiring worker. In some cases there are explicit provisions to this effect in collective contracts. By contrast, a manager can be sent away on payment of three months' notice salary. There is no need for a chargesheet or enquiry, and no opportunity need be given to him to defend himself. Even in the public sector where the civil service is the referent for so many aspects of managerial employment, the manager does not have the job security of a civil servant. The acuteness of the problem comes out in the following observation by the President of the Federation of Officers' Associations of Central Government Industries in Bangalore (FOACIB): "I know from my personal experience and as Member of Parliament that our officers in the public sector do not have job security ... The Class I officers of the IAS have protection under the Constitution. The top management personnel have their terms and conditions of appointment under a contract. But, for strange reasons, the officers employed in the public sector undertakings have been left high and dry. Because of this, there have been many grievances. Till recently there was no method at all of seeking redress. Now the High Courts have started admitting cases of officers in the public sector. I don't know if this is the real solution. Since litigation is a long drawn process, I doubt if some of the cases will be decided during the lifetime of the litigant. Legislative provision for executives is very necessary."[17]

The promotion policies of organisations have also had their effect on association formation. The nationalised banks have to fill by promotion three-fourths of the positions at the lowest point in the officer category. Many organisations promote employees from the ranks to the managerial cadre as a matter of personnel policy even though there is no explicit compulsion. Another common practice is to attack the problem of stagnation through a change of designation while letting the job itself remain unchanged. A sales assistant may be designated as assistant sales officer, or a sales officer as sales manager. Many in industry believe that designations make much difference to the morale of the incumbent, that redesignation as manager would relieve the frustration of a man who has for long borne the label of officer. Promotion from the unionised to non-union categories is also a method of weaning an activist from his union or depriving the union of its leadership. Well known pharmaceutical firms have made extensive use of this strategy in their bid to weaken the union. All these policies, whatever their intention, have the consequence of creating a cadre known popularly as "promotee officers". This category of officers have often been in the forefront of association formation. These employees find it difficult to reconcile to the loss of power they have experienced as union activists and members, and association formation comes naturally to them.

The many reasons for association formation which we have considered point to the existence of a category of employees who fall between two stools—that of worker and of manager. While they are obviously not workers, they are also not managers in that they do not have the power and influence normally associated with managers. The crux of the matter is their lack of influence in the affairs of the organisation and in their own affairs as members of it. This sense of powerlessness as individuals is an important reason why they seek power through the collectivity. In a significant sense other apparently unconnected problems such as erosion of differentials can also be traced back to the lack of power.

The significance of power is highlighted by the reach of association membership to the level of General Manager in the public sector whereas it rarely transcends middle management in the private. The underlying reason is that in the highly bureaucratised public sector there is an acute sense of powerlessness at fairly high levels. As a private sector manager remarked: "Power means different things in the two sectors. In the public sector they think of it as power over people whereas for us it is more over things. In the private sector, a manager who has an idea would be listened to. The idea wouldn't be accepted merely because it comes from him, but it wouldn't be dismissed off hand. In the public sector controlled by the distant BPE, even the GM may have no say over things. And power over people has vanished everywhere with unionisation. So what are they left with?"

The overall situation in which managers find themselves is succinctly summed up in the following observation by an industrial relations consultant with long and varied experience: "The term 'worker' has always meant those who are answerable and accountable for their own work, as opposed to managers who are accountable for the work of others under their charge . . . Under the Industrial Disputes Act, all the personnel in industry are classified as either managers or workmen. Whether such simplistic division of personnel into only two classes at all conforms to the realities of the situation is a point to ponder . . . Manager is one who is responsible for producing results through others under him and who has the authority to change any system in the organisation whenever necessary for producing the results. If such power to change the system is the essential hallmark of a manager, it is felt that many of the officers, executives and administrators having imposing titles and designations, and surrounded by status symbols and enjoying several perks may not after all be managers in the real sense of the term because they do their work only in accordance with the systems given to them without any authority to change them."[18]

The term 'officer' appears to some as a title for this category. By usage and convention the label might well gain this connotation although its etymological justification is doubtful. "Thus officers are those personnel who are neither managers at the top nor workers at the bottom but are somewhere in between engaged in the work of execution, administration and supervision—but not direction or control—in accordance with and under the systems and policies ordained for them by the managers. It is only by courtesy and not logic that such middle-level personnel are euphemistically called middle-level managers."[19]

### The Problem of Recognition

It is one thing to form an association and quite another to have it recognised. Managers are finding it an uphill task to get themselves accepted as a collectivity. Banking is among the few industries that have extended formal recognition, usually as a sequel to determined collective action by managers. Recognition of the right to form a trade union and immunity from individual accountability for collective action were among the major demands to be backed by the historic seventeen days strike by managers of the State Bank of India in 1969. The experience of the banking industry is clearly atypical. In most other situations, managers have not preferred the methods of bankmen, and their associations enjoy neither *de facto* nor *de jure* recognition. The absence of *de jure* recognition should not come as a surprise because there is no statutory compulsion on employers to recognise any kind of combination, whether of workmen or of managers. Without any kind of *de facto* recognition, however, the associations find it impossible to pursue their objectives. The common reaction of Chairmen and Managing Directors to association leaders who want to present a memorandum or push a grievance is the stern admonition not to behave like garrulous trade union leaders.

Leaving out the banking sector and a few other isolated instances, the reaction of management to association formation ranges from outright hostility to informal consultation. With exception, the private sector brings up one end with implacable antagonism and the public sector the other with some form of consultation.

Many private sector organisations have mercilessly sacked the activists to nip the movement in the bud. Multinationals and family-owned firms alike have followed this practice, although the hostility of the latter is understandably more intense. The Managing Director of a private sector firm explained how he smashed the association: "In a set-up like ours, associations would cause enormous damage to the organisation. Our managers went so far as to register themselves as a trade union. I found the fellows who took the initiative to file the application and asked them to explain why they were away from the office without permission. The attendance register showed them all to be present in the office that day. Caught on the wrong foot, they maintained that they were not in fact absent. The signatures on the registration application must then be forged, I argued. They had no choice but to write to the Registrar that the signatures were not theirs. We then informed all the managers that a fraud had been perpetrated by registering the association on forged signatures. Could they trust such men to lead them, I asked. With this the association collapsed."

A more moderate response, once again from the private sector, was narrated by the Personnel Manager of the firm: "Our first reaction when we got wind of the happening was that our officers should not be allowed to do this. We were concerned to somehow prevent the formal registration of the association. I spoke to the ring leaders besides asking the departmental heads to reason with them. The leaders pointed to some anomalies in the wage structure, especially with regard to some individuals. We saw the point of what they said and immediately constituted an informal forum to look into the problem. Our view was that a formal association was not needed since an informal forum could do the job just as well. However, the ring leaders got together secretly and registered the association under the Trade Unions Act. Soon elections were held and office bearers chosen. We called the president and secretary and impressed on them that their action would harm the organisation as well as their own members. They seemed convinced by what we said, but reported back that they were under pressure to remain as a formally registered association. At this stage the management decided not to have any truck with them. The leaders tried to establish communications, but we were not willing to deal with them in their capacity as association spokesmen. We simultaneously persisted with efforts to resolve the problems through the informal forum. The association now started addressing formal letters to the management. We took a conscious decision not to reply to them. We have tried not to be vindictive towards the activists. They got the usual increments after the annual appraisal.

The association is now getting close to the trade union. While negotiations were under way with the union over the charter of demands, the association president was having frequent meetings with union leaders. When a settlement was eventually signed, we made it known that the officers would also get some benefits. We are reviewing the remuneration policy and improving the channels of communication. The problem persists, however. The chief instigators are some promotees from the ranks. The association and the union have discussed the possibility of putting up a joint front. They may gang up against the management."

The public sector presents a more varied picture. There are occasional instances of formal recognition and more frequent ones of informal consultation and negotiation. The change of heart has usually come about after abortive attempts at crushing the movement. The Hindustan Aircrafts (HAL) has extended formal recognition to the association. The Indian Petrochemicals (IPCL) has actually signed a settlement covering salaries and benefits. The document is significantly titled "Record Note of Discussions between IPCL Management and IPCL Officers' Association". It is not a formal settlement like the one signed with trade unions for reasons we shall soon examine. The Steel Authority of India (SAIL) consults the association over the salaries and benefits of managers, but announces the consensus as its own decision rather than a bipartite settlement. There are also formal quarterly meetings attended by the highest functionaries of the management and the association to resolve routine problems such as promotions, transfers, etc. The Chairman of SAIL presides over the meeting which is attended by the four Directors of Personnel, Technical, Commerce and Finance and two association representatives for each major establishment. Association leaders attend these meetings at Delhi or Calcutta at company expense. So much significance is attached to this forum that the association took serious exception to the absence of the Chairman on one occasion. Bharat Heavy Electricals (BHEL), Hindustan Machine Tools (HMT) and Hindustan Cables also have periodic meetings to discuss problems, but they are not as formalised as at SAIL. In the Electronics Corporation of India (ECIL) the association has modified its constitution in response to management pressure, providing for regular meetings of the general body, proper maintenance of minutes and their circulation, etc. But the management continues to play the familiar public sector ball game of seeking permission from above before recognition can be granted.

The public sector also has cases of outright hostility as in much of the private sector. The top brass of several public sector corporations are implacably opposed to any truck with the associations. One of them argued in a seminar that "in the style of management we practice in our country, there is no need for an officers' association". An association spokesman hit back that the "style of management is the villain and not the hero of our environment", and went on to demolish the manager's contention that associations were unheard of in the west.[20] The government's own policy seems to be to have no more than an informal dialogue with the associations. The BPE has confidentially advised public sector management against formal recognition.

A major difficulty associations face in forcing even informal acceptance is the nebulous position they find themselves in before the law. With their strong middle class sensibilities, managers prefer to adopt methods that are lawful, but the legal system offers them little help.

The Trade Unions Act, 1926, recognises the right of managers to combine in pursuit of common interests. Although trade unions are normally understood as collectivities of manual workers, there is nothing in law to restrict the usage to this category of personnel. According to the Act: "Trade Union means any combination, whether temporary or permanent, formed primarily for the purpose of regulating the relationship between workmen and employer, or between workmen and workmen, or between employer and employer, or for imposing restrictive conditions on the conduct of any trade or business, and includes any federation of two or more trade unions." Associations of managers easily fit into the first category of combination to regulate the relationship between workmen and employer because the term "workmen" is itself defined as "all persons engaged in trade or industry" and includes the manager as well. Under the Trade Unions Act, in sum, managers are also workmen and possess the right to combine to regulate the relations between themselves and the employer. By virtue of being trade unions, the associations enjoy immunity from any civil and criminal liability arising from the conduct of trade disputes. The ultimate test of whether associations of managers qualify as trade unions of workmen is registration under the Act by the Registrar of Trade Unions. The fact is that associations do seek, and obtain, such registration. Indeed, some of the older associations which had earlier registered under the Societies Act now prefer to be governed by the Trade Unions Act.

If associations enjoy the benefit of being trade unions, they also suffer from the disabilities of the latter. Indian trade union legislation enables combinations of workmen to exist as lawful associations, but does not require the employer to take cognisance of them. There is yet nothing on the statute books to compel the employer to recognise the union.

The Industrial Disputes Act, 1947, makes up partially for the shortcomings of the Trade Unions Act by providing the institutional mechanism for resolving the conflict between employers and workmen. A trade union of workers can have access to the processes of conciliation, arbitration and adjudication to settle an industrial dispute. That these processes do not meet the requirements of present day industrial relations is common knowledge. What is significant, however, is that even these imperfect procedures are not available to managers because the Industrial Disputes Act does not consider them as workmen. The Act defines 'workmen' as those who commonly perform work of a manual, clerical or technical nature. Supervisory work merits inclusion only where earnings are below Rs 500 per month.[21] Managers are obviously excluded from the purview of the definition. As far as the Industrial Disputes Act is concerned, managers are contract employees whose relation with the employer is governed by individual contract in terms of contract law, and the violation of contract by either party is to be taken to the civil court of the land. They are deemed to be outside collectivism, which means that officers are deemed in law as not having a community of interests.[22]

The overall legal position, thus, is that managers are recognised as workmen by trade union legislation and entitled to form a trade union, but cannot claim recognition by the employer because the law itself is silent over the question. Nor can they raise an industrial dispute before the labour department because they are denied access to the machinery created under the Industrial Disputes Act on the ground of their not being workmen.

### THE RESPONSE OF THE ASSOCIATIONS

Caught in this cleft, associations have pursued several strategies to assert themselves. One method is to claim that managers do in fact perform jobs done by workmen and that they are, therefore, workmen as defined by the Industrial Disputes Act. In the Indian Oil Corporation a shift superintendent claimed to be a workman on this ground. The court observed in this case: "The categorisation of an employee as a workman under Section 2(S) of the Industrial Disputes Act, 1947, depends upon the substantial part of the work performed by him. If an officer, as part of his duty, is required to perform substantial skilled, semi-skilled, unskilled, clerical or manual work, then he has to be called a workman."[23] The court ruled that the officer in question was engaged in such work and declared him a workman. A similar case was disposed of in the same manner in Burmah Shell. Both the cases pertain to individual managers fairly low in the hierarchy who could establish that they were performing jobs of a manual and clerical nature. Whether managers higher up in the ladder can win such a case remains to be seen. An interesting case claiming the collectivity of managers to be workmen is being fought in Engineers India (EIL), a public sector consulting firm. Significantly, the bulk of the employees of EIL are highly qualified engineers and technologists trained in the best educational institutions. The outcome of this case would no doubt be keenly watched. A verdit favourable to the association could open the floodgates for similar claims elsewhere.

A second strategy is to form federations in the belief that they would wield greater clout than individual associations. The bank associations have federated to the AICOBOO at the apex; the power engineers have the All India Power Engineers' Federation; an assortment of associations have affiliated to the AICO; and there are at least two federations of associations in the Central public sector undertakings—one at Bangalore and other at Hyderabad. What was missing was a body that would federate the associations in public sector undertakings all over the country. Stressing the need for such a body, the President of the Federation of Officers' Associations of Central Government Industries in Bangalore (FOACIB) argued: "The cause for many of the present day ills suffered by the officers, I feel, is the absence of a national body. Though most of the two hundred and odd public sector undertakings have officers' associations functioning in them, the voice of this significant and important section of the working force is not being properly heard at the highest quarters. The experience of FOACIB in this regard has confirmed this feeling. When the Central government announced the Constitution of the tripartite committee on DA for public sector undertakings, it approached the Honourable Union Minister for Labour for representation. Pat came the reply: "the forthcoming national conference has limited participation from bodies of an All India character. I regret that it has not been possible to include your participation in it." It is high time that we effectively organised ourselves into an apex body at the national level".[24]

These views were expressed in a conference organised in 1983 by the associations in public sector industries. The conference in fact went on to form a national body by the name National Federation of Officers' Associations of Central Public Sector Undertakings (NFOA). One of the tasks assigned to the NFOA was to take up with the Central government the question of recognising the associations through legislation.

The third strategy is to seek leadership from outside. It would be an obvious exaggeration to say that the associations are in the grip of outside leaders the way the trade unions are. Many powerful associations are determined that leadership should emerge from the ranks. On the other hand, it is quite easy to cite instances of outside leadership being sought. The association in the Indian Oil Corporation has been led by such luminaries as Rajni Patel and Subramaniam Swamy. The President of FOACIB is a Congress MP. The President of its counterpart in the Hyderabad public sector is also a Congress MP. When the associations of public sector undertakings in Bangalore and Hyderabad decided to form the NFOA, they unanimously resolved that the presidents of the two federations should "jointly approach Rajiv Gandhi, MP, and request him to be the president of the NFOA". There are also several cases of the trade union and association in an enterprise having a common president from outside. The incidence of outside leadership is generally more marked among the federations than among individual associations at the level of the enterprise. Overall, the trend appears to be for the associations to move in the direction of outside leadership.

It is paradoxical that managers should have to seek outside leadership. The induction of outside leaders has meant the politicisation of the movement which is anathema to the middle class ethos of managers. Indeed, managers have been among the bitterest critics of the politicisation of the workers' movement. They have always questioned the wisdom of trade unions, whose goal should be to improve workers' living standards, but is dabbling in politics and vitiating industrial relations. At the end of it all, managers themselves are faring no differently. What is more, managers are looking for leadership at a time when the workers themselves have begun to put their leaders on a tight leash. Workers are displaying a growing capacity to judge their leaders, to have leadership on their terms and conditions, and to change it as it suits them. Managers are just now embarking on a process which workers have already traversed, and there are undoubtedly many unpleasant discoveries ahead.

The tendency of the managers' movement to seek external leadership has a few lessons for those who blindly blame the naivete of workers and villainy of leaders for the politicisation of the labour movement. Surely, no one can argue that managers are being misled by politically motivated outsiders. The answer, whethe for worker or manager, must be sough in the continuing need for political clou to achieve collective ends.

A fourth method open to the associations to gather much needed support is to seek the assistance of the trade unions There are so many ramifications to the relationship between associations and trade unions that the subject merits separate consideration.

### UNION-ASSOCIATION RELATIONS

Employees are fearful of associations and trade unions developing close rapport and empathy. Workers have bargaining power whereas middle managers control critical areas of organisational activity besides possessing intimate knowledge of its affairs. A combination of the two would pose challenges of a magnitude not yet witnessed. Aligning with the trade union appears an easy way out of a difficult situation for the managers' movement. Would not the trade unions deploy their superior power on behalf of the managers and win them the kind of benefits they have won for the workers? Do the two organisations not have shared sentiments and a sense of fraternity as protest movements? Trade unions have in fact responded to fraternal calls for assistance from associations pushed to the wall by management hostility. Witness, for instance, the recent incidents in a private sector firm reported by a Bombay newspaper:

> Another unique feature of the association has been solidarity with workers. During the hunger strike by association members to demand reinstatement of dismissed officers, workers also addressed gate meetings. In fact, both the Kamani Employees' Union and the officers' association have the same President . . . In the first instance of its kind in the country, the union was successful in getting four dismissed officers reinstated in 1971 with full back wages . . . A strike is the last resort (says the President). We are using all other methods of demonstration open to us. But if we are forced to call a strike, we are sure the Kamani Employees' Union and the officers' association will fight it together.[25]

As protest movements, trade unions and associations do have shared sentiments and could develop a sense of fraternity. But at the level of nuts and bolts, the relationship is far too complex to permit either straightforward co-operation or implacable hostility. While they do have a common cause, a certain tension and uneasiness also appear natural to their relationship.

Even though workers and managers

nay belong to fraternally linked organisaions, the basic relationship between them has not undergone any mutation. "Managers have, as a group, not exactly endeared hemselves to the rest of the trade union novement. Historically they have been the leliverers of sad news and more often han not the bad tidings have depended upon their decisions."[26]

Managers continue to direct and conrol the activities of their subordinates. n order to direct and control they need o have sanctions. Innate to the job of nanaging is the power to reward and ounish. At the minimum, even lowly placed supervisors have the power to make an dverse entry against workers. Errant workers need to be pulled up, if necessary hrough formal procedures. It is difficult o see how managers can keep away from he process of issuing charge memoranda, conducting enquiries, giving evidence and awarding punishment. For the manager, exercising direction and control, and being nvolved in the attendant procedures, is not simply a matter of doing what the boss wants him to do. To manage is his job, and the performance of functions ntrinsic to the process of management is above all a matter of self-esteem. But the worker will be inclined to see the manager as functioning at the behest and on behalf of the boss. The mere fact of association formation cannot alter the manager's perception of the business of managing or the worker's perception of the man who manages him. As a manager from SAIL remarked: "We sought union help in 1979 when we called a work-to-rule to gain recognition. We now feel it was wrong to have done that. It has become difficult to discipline workers. Troubled by this insubordination, managers have protested against association leaders getting close to the trade union. Recently the union wanted our co-operation for their work-to-rule, but the association declined. We got a nasty letter saying that the General Secretary (a promotee from the ranks) has forgotten his old days"

Managers also continue to require protection against aggressive workers and clerical staff, which was an important reason why they organised. A strong association may temper their aggression, but not change basic attitudes. The knowledge that the branch manager has an organisation at his back may cause a clerk to behave more cautiously, but not promote a relationship of unity and consensus between them. Attitudes do not change because conflict is inherent in the work relations of managers and the managed.

In the midst of these obvious differences, there are also strong and important common interests, especially with regard to the demands on the employer. The associations ask for more for their members, as do the unions. In some cases, the demands can be identical. Even where they are different, the benefits got by one are rarely at the expense of the other. On the contrary, they are likely to be mutually reinforcing in that the concessions wrested by one can be used to legitimise the demands of the other.

Consider, for instance, what the association wants of the Employees' State Insurance Corporation (ESIC). Among its demands are:

(i) Important positions in the Corporation should be filled by internal promotion and not by deputation from the government. Class II and III staff should also be promoted to higher positions on the basis of tests;

(ii) Pegging the status of the Director General (chief functionary) to the level of Additional Secretary causes the entire cadre of officers to be squeezed into a narraw range. The Director General should be of the rank of Secretary to the government;

(iii) Since the Corporation is autonomous, it should have its own salary structure based after similar other Corporations such as the LIC, STC and FCI;

(iv) The Corporation should be free to recruit its own personnel instead of having the UPSC recruit them;

(v) At least one child of every retiring officer should be preferentially employed by the Corporation; and

(vi) Since the Corporation has been designated as an industry, disputes should be resolved in the manner suggested by the Industrial Disputes Act.

Almost every demand of the association is backed by the union of clerical staff. The support is extended not fof fraternal reasons but for reasons of common interest. The filling of plum positions by deputation affects everyone down the line. The officer who is denied a promotion by the entry of an outsider cannot vacate his own position to be filled by his subordinate. The chain reaction causes stagnation across the board. Recognising this, the association has cleverly demanded a policy of internal promotion for the subordinates as well. Officers want preferential employment of their children, a demand which has been made and won by trade unions across the country. The opposition to recruitment by UPSC comes from all quarters. If the Corporation were to recruit its own personnel, the association and the union would have better chances of influencing policy. They can push for the promotion of insiders and limit the entry of new recruits to the tail of the queue. The Corporation is also likely to be more amenable to the demand for preferential employment of children than the distant, impersonal and bureaucratic UPSC. The pay and benefits are better in autonomous corporations than in the government because of higher basic salaries, more generous neutralisation of living costs by dearness allowance, entitlement to bonus and more liberal perquisites. All employees, regardless of status, have reason to demand that the Corporation be really autonomous in the matter of emoluments. A consultant advising the ESIC on its salary and cadre structure remarked that there was a convergence of interests between the association and the union. If anything, the former was trying to outdo the latter.

What do we make of these conflicting pulls and pressures? Will the two organisations come together or stay apart? What kind of relationship are they likely to forge?

By and large, trade unions would like a closer relationship. The common feeling in union circles is also that this is the only way the associations can stabilise themselves. Union leaders find it strange that managers want to stand apart when the advantages of aligning with the union are so obvious. Remarked a leader from a public sector oil company: "Our managers don't get overtime, and their own association does not have the strength to fight for it. The obvious course is to let the union fight on their behalf, but they seem reluctant. The union can get the lower categories of managerial staff recognised as workmen under the ID Act. This way we can gradually extend the coverage of the Act and benefit more people. The association doesn't seem inclined to seek help."

The associations themselves prefer to keep a distance and take whatever help is available than get too close and be reduced to insignificance. The reason why associations do not want to get close are obvious. While the unions might come to the aid of managers, it is unlikely that the latter would ever have the kind of claim on the union that the workers enjoy. Managers who shed their independent identity might find themselves secondary and inferior constituents of the labour movement when the dust settles. They might even find the unions using them to get more for workers. Apart from the inbuilt prejudices of the labour movement towards managers, the sheer numerical superiority of workers ensures their dominance of the movement. Managers, with their insignificant numbers, would be swamped by the blue collar and clerical force. After all, even within the ranks of workers, small crafts and segments find it difficult to have an effective say, which is one of the reasons behind sectional unionism.

Managers are unwilling to stray far from their middle class moorings. Even if they adopt trade union methods, as in the banks, they still feel uncomfortable about the direction trade unionism is taking.

Managers would prefer to be a separate pressure group, distinct from both the workers and white collar staff below and the employer above. In the manner of their German counterparts who do not wish to be represented by workers' forums in spite of pressures from the unions and the state, Indian managers too seem aware of the dangers of throwing in their lot with workers.[27] In fact, there are signs of tension in the few cases where managers have come together in a common organisation with their subordinates. The bank associations which straddle the division are now experiencing conflict between the two segments.

The relationship between the two collectivities is likely to settle at a level where they neither come together under a single banner nor actively cross each other's path. Except in a rare case, they are unlikely to go so far as to mount a joint campaign. Nor would they allow management to use one against another. The traditional management strategy of using officers to keep the operations going and present a facade of normalcy will become increasingly difficult. One of the most significant recent instances of this comes from banking. Officers of the State Bank of India are unhappy over the methods adopted by the clerical staff. SBOA brochures specifically mention that the association is intended among other things to protect officers from their subordinates. Association leaders are candid that the need for protection continues to be relevant two decades after the founding of the association. The relationship between the two bodies is not exactly one of mutual understanding and active co-operation. In spite of this, the association extended fraternal assistance to the union when the clerical staff went on a day's token strike in early 1984 to press their demands. The association decided that officers would not perform on that day any of the functions normally performed by clerks. In trade union parlance, they decided not to blackleg. This simple act of omission brought banking operations to a grinding halt.

This is the kind of shape that association-union relations will assume in future. The hallmark of the relationship is ambivalance. The relation is unlikely to progress beyond extending token support to each other and ensuring that the employer does not take advantage of the ambivalence.

## CONCLUSION

On the basis of present trends, associations of managers appear set for rapid expansion and growth. The characteristic of the post-industrial revolution is the expansion of employment in the provision of services rather than in the manufacturing of goods. India is now witnessing the growth in white collar salariat that has already swept the more developed societies. If the industrial revolution witnessed the rapid rise of blue collar trade unions, the post-industrial one will mark the rise of associations of the salariat. This is inevitable because many of the causes underpinning the organisation of manual workers have now become relevant to officers and managers.

Having collectivised, managers now find themselves at the crossroads. There is a marked sense of equivocation about the methods to be adopted by the association. Harshly put, managers "constitute an army that shows up well in the parade ground but about whose willingness or ability to shoot there is much doubt".[28] In more charitable language, "managerial employees shy away from using the more direct and forceful instrument of strife. The evidence shows that they intend to rely on argument; there is a strong belief among them that in controversies with the top management the facts will decide".[29]

Which way this dilemma over means would be resolved depends much on how far managers are pushed. In the words of the General Secretary of the AICO: "Top managers in India have come to view the trade union as an adversary, and such a frame of mind cannot but result in action aimed at liquidating the associations. The effort, however, would be just the opposite. It will promote militancy, a situation which we now face in our labour relations due to past sins. It is the management which can avoid a repetition of this by acknowledging the reality of officers' associations and turning them into a positve force."[30] There already are signs that militancy may be growing. As a bank manager remarked: "In the beginning we thought it below our dignity to demonstrate, march the streets and shout slogans. Today we have become accustomed to all this. If you want to be a trade unionist you must accept trade union methods."[31]

Managing the manager is the challenge of the future. Managing knowledge work and knowledge worker is "today and tomorrow" rather than "yesterday". Because it is essentially a new task, we know even less about it than we know about the management (or mismanagement) of the manual worker. It is, therefore, going to be the more difficult task. But there is no long legacy of bitterness, of mutual suspicion, of resentment masquerading as scientific theories, and of folklore that has set into the hard concrete of restrictions, rules and regulations. Managing knowledge work and knowledge worker therefore can focus on developing the right policies and practices. It can focus on the future rather than undoing the past, on the opportunities rather than on "problems".

"Managing knowledge work and knowledge worker will require exceptional imagination, exceptional courage, and leadership of a high order. In some ways it will be a far more demanding task than managing the manual worker was until very recently. For the weapon of fear—fear of economic suffering, fear of job security, physical fear of company guards or of the state's police power—which for so long substituted for managing manual work and the manual worker, are simply not operative at all in the context of knowledge work and knowledge worker. The knowledge worker, except on the very lowest levels of knowledge work, is not productive under the spur of fear; only self-motivation and self-direction can make him productive. He has to be achieving in order to be productive at all."[31]

## Notes

[My interest in managerial associations owes much to the efforts of T K Jagdeesh and R L Kapur. When Jadgeesh, then national President of the National Institute of Personnel Management, invited me to speak on associations to a group of managers, I was most reluctant to dilate on a subject which was then unfamiliar to me. But the bait he offered was hard to resist—he would bring together a group of leading managers and association leaders whom I could guide in a discussion of the subject. I fell readily for it. Kapur did the rest. He hosted us for the discussion at his office in Calcutta and provided the entire infrastructure. The result was not mere generation of fascinating data; it was also the discovery of a new research technique. Some six months later I repeated the exercise with a group of industrial relations managers at the Administrative Staff College, Hyderabad, once again with the same beneficial results. I extend my thanks to both for drawing me into this subject, and to the managers who participated in the meetings for giving the benefit of their understanding. I also thank Shivaji Gupta Roy and B Muraleedharan who kept detailed notes of the discussions on the two occasions.

B R Virmani and R V Sarjotishi helped me lay hands on secondary materials such as seminar proceedings, paper clippings, and court decisions. They also read and commented on an earlier draft of the essay besides sustaining my interest in the subject. My thanks to them.]

## ICICI

INDUSTRIAL CREDIT AND INVESTMENT CORPORATION OF INDIA (ICICI) has had another year of good performance. Its total sanctions in 1984 recorded an increase of 28.7 per cent over those of 1983 and amounted to Rs 567.83 crore. Disbursements amounted to Rs 388.14 crore against Rs 334.76 crore—an increase of 15.9 per cent. Sanctions of assistance in foreign currencies amounted to Rs 165.34 crore forming 29.1 per cent of total sanctions and rupee assistance was Rs 402.49 crore. Assistance sanctioned in the form of suppliers' credit amounted to Rs 56.73 crore as against Rs 36.97 crore in 1983—an increase of 53.4 per cent over that of last year. Disbursements against these credits rose to Rs 31.52 crore from Rs 29.26 crore. Sanctions of direct assistance in 1984 to projects located in backward districts was higher at Rs 278.74 crore forming 57 per cent of the total direct sanctions. ICICI's leasing operations showed a significant growth during the year with assistance aggregating Rs 22.31 crore sanctioned against Rs 12.14 crore in 1983.

The Corporation's gross income increased to Rs 161.05 crore from Rs 132.75 crore in 1983. Net profit for the year was Rs 22.07, after making provision for taxation of Rs 14.60 crore including interest tax Rs 2.90 crore (Rs 13 crore, including interest tax of Rs 2.50 crore for 1983). The Corporation has proposed an unchanged dividend of 16 per cent on expanded capital including bonus shares and on pro-rata basis on 'rights' shares issued in June and September last. In order to meet the multi-currency requirements of its clients, ICICI raised resources in diversified currencies amounting to an equivalent of US $ 114 million. Two syndicated loan agreements were signed: the first for US $ 15 million and £ 10 million and the second for US $ 25 million and ECU 30 million. Japanese Yen 5 billion were raised by way of private placement of bonds in the Japanese capital market at rates available only to prime borrowers. The agreement for £ 5 million allocated to ICICI under UK/India ICICI Grant 1984 was signed and an allocation of DM 25 million from Kreditanstalt fur Wiederaufbau was obtained under the twenty-fourth line of credit.

The total amount of rupee resources raised by ICICI during 1984 amounted to Rs 187.83 crore comprising Rs 6.75 crore by way of increase in share capital, Rs 163 crore in bonds and Rs 18.08 crore as loans and deposits as against Rs 137.50 crore, all raised in the form of bonds in 1983. The total resources of the Corporation (net of repayments and cancellations) as at the end of 1984 aggregated Rs 1,919.29 crore—Rs 789.97 crore in foreign currencies and Rs 1,129.32 crore in rupees. The cumulative assistance sanctioned by ICICI upto the end of 1984 amounted to Rs 3,239.07 crore comprising Rs 1,342.02 crore in foreign currencies and Rs 1,897.05 crore in rupees including guarantees. This assistance was spread over 2,063 enterprises for 4,371 projects, of which 1,038 were new companies. Of these, 400 were set up by new entrepreneurs. During 1984, the Merchant Banking Division of ICICI assisted 51 companies for raising an amount of Rs 505 crore. Since its inception in 1973, the division has assisted 215 companies in raising an amount of Rs 1,543 crore. ICICI set up a Chair for Management and Policy Research at the Jamnalal Bajaj Institute of Management, University of Bombay. A grant of Rs eight lakh was made in 1984.

# Corporate Investment in 1985

## A Forecast

**Philip Thomas**
**Ranjana Pendharkar**

*An attempt is made here to forecast the growth in private corporate investment in 1985. Corporate investment covered includes gross capital expenditure of all companies in the private and joint sectors. The study also sheds light on the level and composition of corporate investment in 1984.*

BASED on the data available with the term lending institutions on the expected phasing of capital expenditures of projects sanctioned by them, forecasts of corporate investment are being made annually since 1970. The methodology for the forecast was developed by C Rangarajan and the same methodology is used for the present forecast of corporate investment during 1985. Details of the technique followed as well as limitations of this approach have been explained by Rangarajan in his earlier writings[1].

The forecast of corporate investment is based on the gross capital expenditures of all private as well as joint sector companies. Besides a forecast for 1985 the study presents data on the composition and level of corporate investment in 1984.

As most projects involving large sums of investment in the private corporate sector are covered by financial assistance from the term lending institutions, a study based on projects sanctioned assistance by the institutions would reflect trends in investment pattern of the entire sector. However, as noted in the study for 1984[2], lately, as a result of liberalisation in government policies, it has been possible for some of the established companies to raise substantial amounts through the capital market, especially through public issues of convertible and non-convertible debentures to undertake large projects without seeking any direct assistance from the term lending institutions. To that extent, this study would not fully encompass the corporate sector investment activity. It would accordingly be necessary to adjust the trends as revealed by this study by allowing for the additional investments financed entirely through the capital market.

Another limitation of this method of forecasting is that part of the capital expenditure to be incurred in any year comes out of the projects sanctioned in that very year itself and the available information may not fully cover the trends in this regard. While pending applications with the term lending institutions can give some indication, these cannot be treated as satisfactory lead indicators.

A third limitation of the model of forecasting as pointed out by Rangarajan[1] is that the validity of the estimate depends upon how closely companies adhere to the expenditure patterns outlined in the initial project proposals submitted to the term lending institutions at the time of appraisal. In the absence of any general formula by which one can modify the original phasing of capital expenditures, one has to be content with incorporating changes in the original phasing of capital expenditures as and when new information is made available to the financial institutions and using judgment so as to take into account the existence of major operating factors such as availability of necessary inputs, the performance of the infrastructural sectors like power, transport and coal, and the state of industrial relations. These factors to a great extent can help or hinder the implementation of projects and in turn affect the level of corporate investment in a given time frame.

In spite of the above limitations, this method indicates at least the minimum investment that will be made and would also indicate, other things remaining the same, the order of fresh sanctions and the amount of investment related thereto, which would have to take place, if investment in the forecast year is to show a rise over the previous year's level.

### CAPITAL EXPENDITURE IN 1984

Based on the phasing of capital expenditures, investment in the private sector in 1984 is presented in Table 1. It is estimated at Rs 2,706 crore in 1984 as against Rs 2,571 crore for 1983. In the light of a review of actual expenditure, the capital expenditure for 1983 is revised downwards at Rs 2,521 crore as about Rs 50 crore of capital expenditure which was supposed to be incurred in 1983 was not incurred. The expected expenditure in 1984 for the projects sanctioned assistance in 1984 itself was to the tune of Rs 1,041 crore. However, in the light of review of actual expenditures it is now estimated that instead of Rs 1,041 crore, the capital expenditure on projects sanctioned in 1984 during that year itself may have amounted to Rs 900 crore and hence the total invest-

TABLE 1: PHASING OF CAPITAL EXPENDITURES ON PROJECTS SANCTIONED ASSISTANCE BY TERM LENDING INSTITUTIONS

*(Rs in crore)*

| Year of Sanction | Expenditure in | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | 1974 | 1975 | 1976 | 1977 | 1978 | 1979 | 1980 | 1981 | 1982 | 1983 | 1984 | 1985 |
| 1962-73 | 442.36 | 169.11 | 68.46 | 50.15 | 18.73 | 13.03 | | | | | | |
| 1974 | 198.32 | 204.13 | 144.11 | 21.93 | 12.45 | — | | | | | | |
| 1975 | 40.16 | 114.23 | 231.22 | 215.35 | 118.54 | 52.00 | 8.79 | | | | | |

| 1978 | | | 3.26 | 59.42 | 280.52 | 432.22 | 321.50 | 169.57 | 54.03 | | | |
| 1979 | | | | | 48.49 | 352.40 | 621.27 | 329.14 | 111.58 | 51.72 | 24.59 | |
| 1980 | | | | | | 103.79 | 509.86 | 880.28 | 446.25 | 269.76 | 201.20 | 103.37 |
| 1981 | | | | | | | 281.24 | 893.92 | 1047.46 | 526.53 | 220.77 | 187.78 |
| 1982 | | | | | | | | 23.43 | 717.64 | 640.40 | 297.27 | 124.18 |
| 1983 | | | | | | | | | 35.80 | 762.46 | 92126 | 504.08 |
| 1984 | | | | | | | | | | 319.84 | 1040.71 | 1180.39 |
| | 680.84 | 529.95 | 705.66 | 1024.95 | 1068.02 | 1207.34 | 1830.07 | 2337.10 | 2412.76 | 2570.71 | 2705.80 | 2099.80 |

ment in 1984 could be placed at Rs 2,606 crore, showing an increase of only 3 per cent over 1983.

Though the aggregate cost of projects sanctioned was significantly higher in 1984 (Rs 3,243 crore), (see Table 2), as compared to 1983 (Rs 2,280 crore), the total investment in the private corporate sector in 1984 in projects covered by institutional assistance is to be placed only a shade higher than in 1983. The main reason for this apparently paradoxical picture is that a significantly large proportion or 31 per cent of the cost of projects sanctioned assistance in 1983 was expected to be spent in 1983 itself, whereas for projects sanctioned in 1984 only 23 per cent of the cost was expected to be incurred in 1984 itself.

Another reason was that unlike in 1983, the advance expenditure (incurred in periods prior to year of sanction) on projects sanctioned assistance in 1984 was quite high. In other words the companies had already incurred expenditures in 1983 on projects sanctioned in 1984.

Besides direct project assistance, disbursements under IDBI's Bill Rediscounting Scheme have been an important source of finance for capital expenditure in the private corporate sector. The aggregate investment in this sector, taking both projects sanctioned direct assistance and investments covered by Bill Rediscounting would work out at Rs 2,906 crore in 1984.

The investment estimates in any given year would be at the price level of that year; while comparing the investment figures for the different years, therefore, there is a need to reduce all the prices to a common level. To arrive at the trends in investment at constant prices all the figures at current prices have, therefore, been deflated with the index of wholesale prices for machinery and transport equipment (1970-71 = 100). The deflated figures for investment work out to be Rs 1,019, Rs 1,087 and Rs 1,020 crore in 1982, 1983 and 1984 respectively. Thus in real terms the capital expenditure in 1984 declined by about 6 per cent over 1983.

## NEW PROJECTS SANCTIONED IN 1984

Table 2 indicates an industry-wise picture of the projects sanctioned assistance during the calendar year 1984. The total cost of all projects in the private corporate sector sanctioned assistance in 1984 amounted to Rs 3,243 crore as against Rs 2,280 crore in 1983. This increase could, to a great extent, be attributed to the presence of 40 large projects each with project cost exceeding Rs 15 crore and aggregating to as much as Rs 1,193 crore (or more than one-third) as compared to 24 projects amounting to Rs 1,079 crore in 1983.

A significant change could be seen in the composition of project cost according to the industries in 1984 *vis-a-vis* the previous year. Of the total assistance sanctioned, Rs 390 crore were for 'cement' projects in 1984 as compared to Rs 629 crore in 1983. The relative share of cement industry also declined from 27.6 per cent to 12.4 per cent over the same period. Similarly, the share of chemicals and petrochemicals also declined from 14.8 per cent in 1983 to 9.3 per cent in 1984.

Unlike cement, chemicals and petrochemicals, textiles (other than jute), pesticides and fertilisers, pulp, paper and its products and electricity generation industries registered significant increases. The sanctioned assistance to textile projects rose from Rs 224 crore in 1983 to Rs 608 crore in 1984 comprising Rs 328 crore towards modernisation and marginal expansion of existing units and Rs 280 crore for setting up new units including man-made fibres. In case of electricity generation, the project cost sharply increased from mere Rs 37 crore in 1983 to Rs 415 crore in 1984 due to a single large

TABLE 2: INDUSTRY-WISE PROJECT COST OF PROJECTS SANCTIONED BY FINANCIAL INSTITUTIONS IN 1984

*(Rs in crore)*

| Industry | Total Project Cost | Percentage to Total Project Cost | No of Projects |

*(Rs in crore)*

| State | Total Project Cost | Percentage to Total Project Cost |
|---|---|---|
| Andhra Pradesh | 448.34 | 13.83 |
| Arunachal Pradesh | 1.11 | 0.03 |
| Assam | 0.20 | neg |
| Bihar | 44.09 | 1.36 |
| Delhi | 25.11 | 0.77 |
| Gujarat | 350.03 | 10.80 |
| Haryana | 60.86 | 1.88 |
| Himachal Pradesh | 15.95 | 0.49 |
| Jammu and Kashmir | 43.94 | 1.36 |
| Karnataka | 100.52 | 3.10 |
| Kerala | 95.53 | 2.95 |
| Madhya Pradesh | 197.00 | 6.07 |
| Maharashtra | 777.00 | 23.96 |
| Orissa | 375.46 | 11.58 |
| Pondicherry | 18.06 | 0.56 |
| Punjab | 132.10 | 4.07 |
| Rajasthan | 85.16 | 2.53 |
| Tamil Nadu | 181.29 | 5.59 |
| Uttar Pradesh | 239.36 | 7.38 |
| West Bengal | 50.04 | 1.54 |
| Other Union Territories | 1.85 | 0.05 |
| Total | 3,243.00 | 100.00 |

electricity generation project. Other industries which showed significant increases were:

Fertilisers (increase from Rs 20 crore in 1983 to Rs 149 crore in 1984) and pesticides (increase from about Rs 50 crore to Rs 101 crore).

At the aggregate level, the total investment intentions in the private corporate sector (including joint sector) has shown an improvement in 1984 as compared to 1983. Though the number of new companies marginally declined from 114 in 1983 to 112 in 1984, their total project cost increased from Rs 1,060 crore to Rs 1,618 crore over the same period, registering an increase of almost 53 per cent.

In case of joint sector companies, the assistance sanctioned was marginally higher in 1984 as compared to 1983. In 1984, the total project cost of 43 joint sector companies assisted by the term lending institutions was Rs 626 crore as against 50 joint sector companies with project cost totalling Rs 612 crore in 1983.

### STATE-WISE DISTRIBUTION OF INVESTMENT

Table 3 presents the picture of the state-wise distribution of the capital cost of private corporate sector projects sanctioned assistance by the financial institutions in 1984. Since the state-wise flow of assistance from all-India institutions in any particular year is governed by the timing and location of a few large projects, there occur relatively large changes in the relative share of states in particular years. For instance, in 1984, Maharashtra ranked first with project cost amounting to Rs 777 crore or nearly one-fourth of the total project cost as against the corresponding figure for this state in 1983 of Rs 372 crore or 16 per cent of the total project cost, principally due to a large power project located in the state which was sanctioned assistance in 1984.

Andhra Pradesh held the second rank with the project cost of Rs 448 crore or 13.8 per cent of total project cost. The cost of the projects sanctioned assistance in Orissa registered a substantial increase from Rs 59 crore in 1983 to Rs 375 crore in 1984. With this large increase, Orissa was in the third position.

### FORECAST FOR 1985

On the basis of the phasing of capital expenditure to be incurred on projects sanctioned assistance by the term lending institutions upto the end of 1984, the investment in the private corporate sector in 1985 is estimated around Rs 2,100 crore. To this, about Rs 850-Rs 900 crore may be added as the likely investment in projects to be sanctioned during 1985 itself or immediately thereafter. (In the total investment in 1984, around Rs 921 crore came from projects sanctioned in 1984 itself.) Another Rs 300 crore of investment could be estimated to be financed under the Bill Rediscounting Scheme of the IDBI. Thus the total investment in the private corporate sector in projects covered by institutional assistance can be expected to be Rs 3,300 crore in 1985 as against Rs 2,906 crore in 1984 registering an increase of 12 to 14 per cent in nominal terms in 1985.

## BHEL

BHARAT HEAVY ELECTRICALS (BHEL) is acquiring the latest technology for prevention of corrosion in underground and under-water equipment from HARCO Corporation of USA, a world leader in the field with 36 years experience. An agreement to this effect was signed recently by K L Puri, Chairman and Managing Director of BHEL and Russel Stambaugh, President of HARCO. BHEL will develop this technology at its Bhopal plant with the existing facilities. The technology called 'Cathodic Protection' will be utilised for the prevention of corrosion in off-shore structures such as drilling rigs, submerged pipelines, semi-submersibles, off-shore platforms, ocean going vessels and submarines. It also has application in underground pipelines (carrying gas, oil and petroleum products), bridges high rise buildings, storage tanks, thermal and nuclear power plants and water supply systems. This technology is also being planned to be used in the prestigious 1,700 km long Hazira-Bijapur-Jagdishpur pipeline to be installed for transportation of Bombay high gas to new fertiliser plants coming up in the Seventh Plan. It is estimated that the introduction of this technology will lead to annual foreign exchange savings of Rs 15 crore, besides increase in the life span of equipment.

The year 1984-85 is the terminal year of the Sixth Five-Year Plan. During the Sixth Plan period, BHEL has doubled annual turnover and increased profits 2½ times. The company consolidated its financial position in such a manner that all investment needs in the Seventh Plan will be met entirely from internal resources without any budgetary support from the government. It doubled the installed capacity of BHEL generating sets in the country, taking its share to 56 per cent of total installed capacity in the country. It geared itself both technologically and manufacturing capacity-wise to meet the entire requirements of the country for power equipment. The company set up four new manufacturing plants in remote areas—at Ranipet in Tamil Nadu, Jagdishpur and Rudrapur in UP and Goindwal in Punjab.

**M.PHIL COURSE IN APPLIED ECONOMICS 1985-86**

The Centre for Development Studies conducts a 1-year course in Applied Economics leading to the M.Phil Degree of the Jawaharlal Nehru University. The minimum qualification for admission is a Master's Degree from a recognised University or its equivalent in either any of the social sciences or disciplines like engineering, physical sciences, agricultural sciences, and law. Fellowships of the value of Rs 500/- per month are available to the selected candidates who do not receive any financial support from elsewhere. The prospectus and application forms will be supplied on request. Candidates should submit along with the application, a statement (of about 1500 words) of the problem which they would like to work on for their dissertation. Candidates may also be required to attend a personal interview, at own cost. The interviews are usually held at Trivandrum, Hyderabad, Calcutta, Bombay and New Delhi in early August. Completed applications should be received not later than July 10, 1985. The course will commence on September 2, 1985.

Director

'How to give
your product
a strong backbone'

**Petrez**

**Aromatic Hydrocarbon Resin**

Golden coloured Petrez. The innovative resin. The backbone of products like rubber, paints, adhesives and printing inks. Specially created in a range of softening points varying from 70 ± 5°C to 130 ± 5°C (DIN 53180), to suit your specific need.

Now from IPCL in technical collaboration with CdF Chimie of France.

Petrez is the uncontested choice when you are looking for a resin that is economical, chemically neutral, and is compatible with other resins.

Petrez is an economical substitute for wood-rosin and the more expensive coumarone indene, terpenic and alkyd resins. This means your profitability goes up, while your quality remains as good as ever.

Petrez is just right.

Now available from IPCL and its regional offices.

To know more about Petrez, contact:

# Treatment Failure in National TB Programme

**Kashyap Mankodi**
**Klass W van der Veen**

*The carefully planned National Tuberculosis Programme (NTP) was evolved after independence and was widely acclaimed as a comprehensive, realistic, and feasible blueprint for achieving tuberculosis control. However, due to various reasons, the programme has failed to make the desired impact on the problem of tuberculosis. Two types of problems beset the NTP: external organisational and administrative ones and those that are internal to it and determine its prospects of success or failure.*

*While it may be hoped that the external problems faced by the NTP can be eventually solved given enough political will and commitment, the problems internal to the programme are an altogether different story. The former are located in organisational and administrative structures and therefore lend themselves to solution by governmental action. The latter are, however, located in the interface between health institutions and the public and are therefore much harder to solve. It is even doubtful that they have yet been sufficiently understood.*

*For the NTP to succeed, detailed studies of who avails of the facilities provided by the NTP and who does not, and who takes proper treatment through the NTP and who does not, and why, need to be carried out. The present study seeks answers to precisely such questions: What is the normal response of persons in the area selected for the study to illness in general and tuberculosis in particular? Who goes to the district tuberculosis centre, why and how? Who takes proper treatment and who does not, and why?*

AN estimated ten to eleven million patients suffer from tuberculosis in India.[1] Tuberculosis thrives where there is poverty—poor nutrition and cramped and unhygienic housing conditions. Hence the only lasting solution to the problem of tuberculosis would be the removal of poverty. However advances in chemotherapy have made possible a faster way of controlling tuberculosis than that provided by improving standards of living. The carefully planned National Tuberculosis Programme (NTP) was evolved after independence[2] to control the disease and was widely acclaimed as a comprehensive, realistic, and feasible blueprint for taking this short cut towards achieving tuberculosis control. However due to various problems faced by the programme there is reason to believe that it has failed to make the desired impact on the problem of tuberculosis.

The NTP could not be an exclusive and specialised ('vertical') programme because to mount such a programme on so massive a scale would perforce drain scarce resources from other equally important programmes. It was therefore integrated with the general health services and it was hoped that it would grow with the growth of the latter. Furthermore the NTP was to have a passive or 'felt need' orientation. It had been found in a seminal sociological study that practically all infectious tuberculosis patients were symptomatic or aware of being ill and nearly half of them had actually sought treatment from existing institutions of modern medicine.[3] It was therefore decided not to concentrate disproportionately on active surviellance for case detection or motivation of patients for accepting modern medical treatment for tuberculosis.

The two main aims of the NTP were to vaccinate uninfected persons for preventing the spread of the disease and to provide chemotherapeutic treatment to active cases of tuberculosis to arrest, and eventually to shrink, the pool of infectors. In the initial stages more stress was laid on mass vaccination with BCG because it was considered to be a simple, practical, and inexpensive preventive measure that could be applied to the entire population. However with the emergence of powerful new anti-tuberculosis drugs, with which the pool of infectors could be reduced, chemotherapy came to be regarded as a relatively more valuable tool for tuberculosis control than preventive vaccination. Now it has also been demonstrated, after a large double-blind study of about 3,00,000 persons, that BCG offers no protection against pulmonary tuberculosis over a ten year period of follow-up.[4]

It is therefore crucial to examine the working of the treatment programme to locate problems and suggest remedies. An expert committee of the Indian Council for Medical Research appointed to review the operational aspects of the NTP in 1975 reported that case finding within the NTP was nominal and there was no machinery for the retrieval of defaulting patients at the peripheral health institutions. One reason for this seemed to be that the full quota of trained staff was not always available and supervision and maintenance were inadequate, hence essential equipment often remained out of order. Actiyities of the peripheral institutions were also found to be localised within a small circle surrounding it.[5]

These observations pertain to treatment taken by tuberculosis patients at government health institutions. Many patients also seek and attempt to complete treat-

ment from private institutions. The interaction between the private and the public sectors in the treatment of tuberculosis will be discussed below, since it strongly influences both case detection as well as case holding by government institutions. Before underlining the importance of case detection and case holding and examining in depth the factors responsible for the poor showing of the NTP on both counts, one general point needs to be made about case holding. Since domiciliary treatment is not supervised, or only minimally supervised, irregularity in drug intake or premature termination of treatment are bound to be rampant, even more so when no proper information on the required duration of treatment is given. Chemotherapy for tuberculosis should normally continue for a year or more, but patients understandably tend to terminate their treatment soon after their symptoms have disappeared especially if they are not instructed properly about the reasons for continuation. With patients taking treatment from private institutions there is additionally the problem of cost which they cannot always afford for the entire duration of treatment required.

TABLE 3: MEDICAL EXPENDITURE INCURRED DURING PRECEDING YEAR

| | Per Cent of General Sample of Households | Per Cent of Patients' Households |
|---|---|---|
| No treatment sought | 41 | 63 |
| Free treatment only | 15 | 15 |
| Medical expenditure incurred | 44 | 22 |

### PROBLEMS AND PROSPECTS OF NTP

Two types of problems beset the NTP: external organisational and administrative ones and those that are internal to it and determine its prospects of success or failure. Many problems of the former type were identified during the early test run of the programme. These pertained mainly to training and reorientation of personnel all the way from village level workers to top policy-makers; to tackle tuberculosis as a social, and not merely a clinical, problem. District tuberculosis centres had to be set up and staffed and the various workers trained and motivated to co-ordinate their efforts with other district level health workers to ensure efficient case detection, an uninterrupted flow of supplies for diagnosis and treatment, and proper documentation and supervision of treatment.

Organisational and administrative problems have unfortunately continued to hamper the operation of the NTP even two decades after its inception. District TB centres have not been set up in all the districts in the country yet.[6] Since health is a state subject state governments were expected to contribute half of the amount set aside for tuberculosis control. However many state governments divert funds earmarked for health to other sectors, and tend to neglect tuberculosis control. In order to rectify this the Union Minister for Health and Family Welfare has announced that the NTP will be converted to a 100 per cent centrally sponsored scheme, and instead of paying cash to state governments, the Central government will directly bear the cost of the programme in toto.[7] Tuberculosis control has also been included in the Prime Minister's new 20-Point Programme, and rigorous targets have been set for the states in order to reactivate the programme.

TABLE 4: HOUSING TYPE AS INDICATOR OF SOCIO-ECONOMIC POSITION IN GENERAL POPULATION AND TB PATIENTS

| Housing Type | General Population | | Tuberculosis Patients | |
|---|---|---|---|---|
| | Number | Percentage | Number | Percentage |
| (1) Huts with thatched roof | 77 | 13.5 | 46 | 11.0 |
| (2) Huts with tiled roofs | 185 | 32.5 | 191 | 47.0 |
| (3) Brick wall house | 296 | 47.3 | 127 | 32.5 |
| (4) Cement-concrete house | 38 | 6.7 | 31 | 8.0 |
| Not available | — | — | 7 | 2.0 |
| Total | 569 | 100.0 | 402 | 100.0 |

TABLE 5: LANDHOLDING AS INDICATOR OF SOCIO-ECONOMIC POSITION IN SAMPLE OF GENERAL POPULATION AS COMPARED WITH TB PATIENTS

| Landholding | General Population | | Tuberculosis Patients | |
|---|---|---|---|---|
| | Number | Percentage | Number | Percentage |
| Nil | 403 | 70.8 | 329 | 81.8 |
| Less than 2.5 acres | 95 | 16.6 | 40 | 10.0 |
| 2.5 to 5 acres | 39 | 6.8 | 19 | 4.7 |
| 6 to 10 acres | 21 | 3.6 | 7 | 1.7 |
| More than 11 acres | 11 | 1.0 | 2 | 0.5 |
| Not available | — | — | 5 | 1.2 |
| Total | 569 | 100.0 | 402 | 100.0 |

While it may be hoped that external problems faced by the NTP can be eventually solved given enough political will and commitment, the problems internal to the programme are an altogether different story. The former are located in organisational and administrative structures and therefore lend themselves to solution by governmental action. The latter are however located in the interface between health institutions and the public and are therefore much harder to solve. It is even arguable if they have yet been sufficiently understood.

With the failure of the immunisation programme against tuberculosis, the only hope for containing tuberculosis in India —apart from the removal of proverty, which is too distant a goal to deserve discussion here—is the treatment programme. In a paper published recently[8] the efficiency of different components of the treatment programme and the overall success of the programme are estimated from published reports of the working of the NTP in different districts.

The three main components of the treatment programme are, (i) case detection, (ii) case-holding, and (iii) chemotherapy. It has been found that the efficiency of the case detection component is about 30 per cent, that of the case-holding component is about 30-35 per cent and that of the third component is about 75 per cent. Thus the overall success, or the percentage of patients of tuberculosis cured by the NTP, is as low as eight per cent. It is argued that for the same amount of increase in the efficiency of a component, the returns are better with improvement in case-finding or case-holding than with chemotherapy. Though short-course regimens of chemotherapy may be expected to lead to better case-holding, at the present juncture the overall success of the treatment programme rests much more heavily on improving the efficiency of case-finding and case-holding than on evolving more and more effective drug regimens under study conditions.[9]

The implication of this finding is clear: for the NTP to succeed, detailed studies of who avails of facilities provided by the NTP and who does not, and who takes proper treatment through the NTP and who does not, and why, need to be carried out.

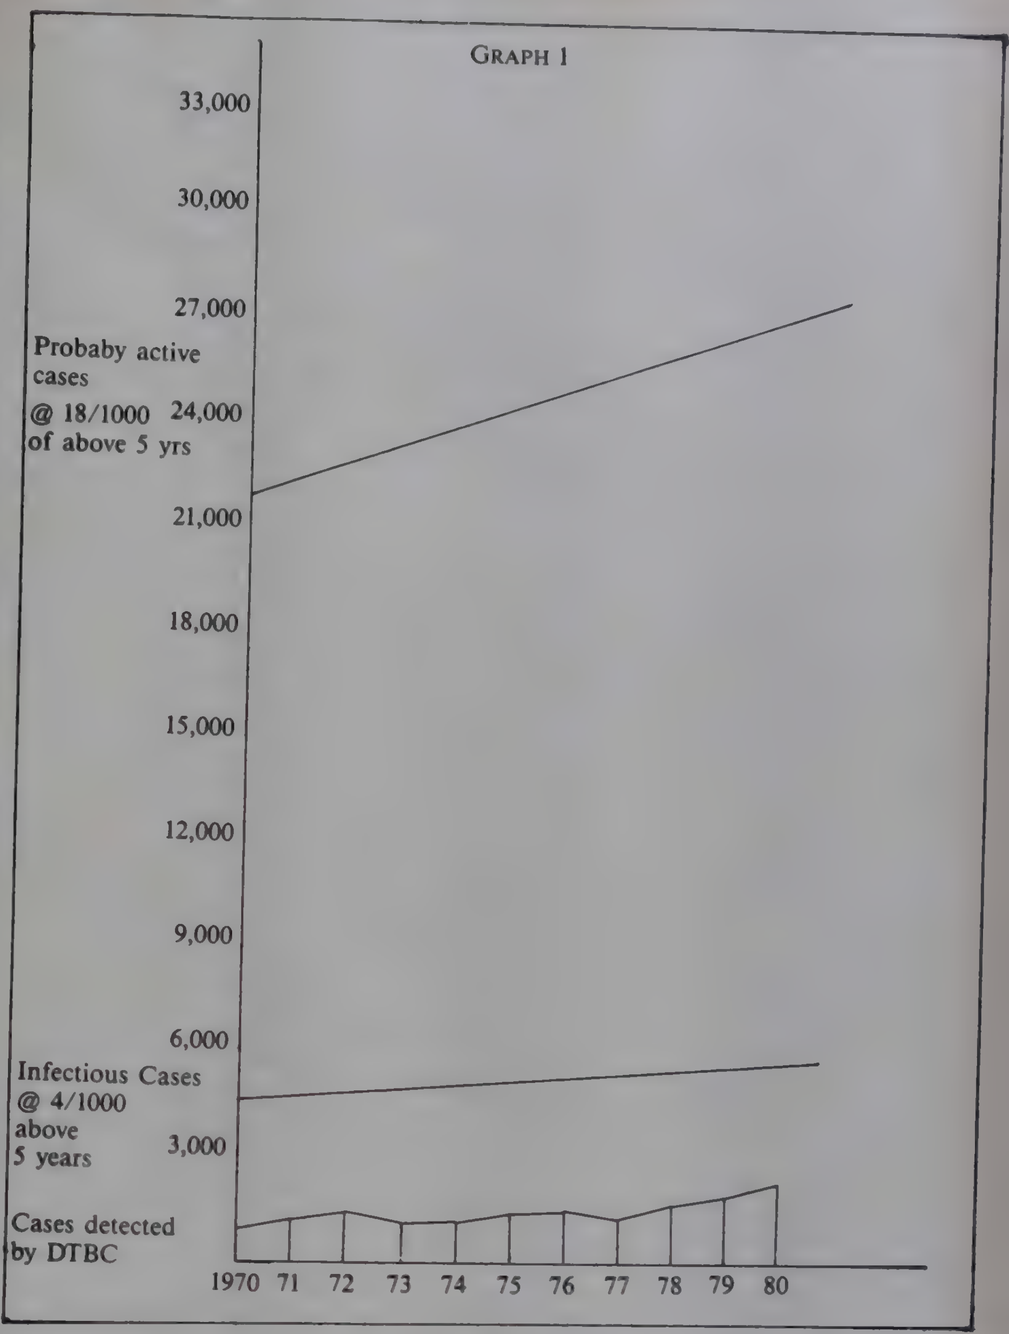
The study described below was motivated by precisely such questions: what is the normal response of persons in the area selected for the study to illness in general and tuberculosis in particular? Who goes to the district tuberculosis centre, why and how? Who takes proper treatment and who does not, and why?

### MATERIALS AND METHODS

The study was carried out in Valsad, the southernmost district on the Gujarat coast. In terms of literacy it is among the top 15 per cent districts in the country. The coastal plain of the district is dense in population and has a highly developed transport and communication network. It is predominantly agricultural, though there is substantial industrial development around the towns of Navsari, Valsad, Billimora, and Vapi. Access to medical facilities in this region is relatively easy as compared to other parts of the district too. Practically every village has several medical practitioners and is close to public or charitable clinics or hospitals, and the nearby towns have a large number of private practitioners and consultants who cater to patients from surrounding areas. Some villages have practitioners of other systems of medicine besides allopathy, including *bhuva-bhagats* or folk healers. The district tuberculosis centre (DTC) which is located in Navsari has been functioning since 1969.

*(a) The first phase:* The study was done in two phases. The first phase involved an in-depth anthropological study of tuberculosis patients from one village with a population of about 5,600. A qualitative analysis of the history of the illness and of the treatment taken by 32 patients in the villages was carried out with a view to design a valid questionnaire for a larger quantitative survey. The emphasis in this phase was on the identification of patterns of treatment *vis-a-vis* the socio-economic status of the patients, and the choice between private practitioners and public health facilities.

GRAPH 1



It was found that private doctors dominated in the public consideration. Most patients first approached private practitioners and many went to public clinics only at a relatively late stage after their health had deteriorated considerably. The poorer patients who were forced to approach public clinics for free treatment seemed to fare much better on the whole. In general, those who took treatment from the DTC relatively earlier, i e, shortly after the onset of symptoms, tended to take more regular and complete treatment. Consequently they were more likely to be cured, and less likely to die of tuberculosis, than other patients.

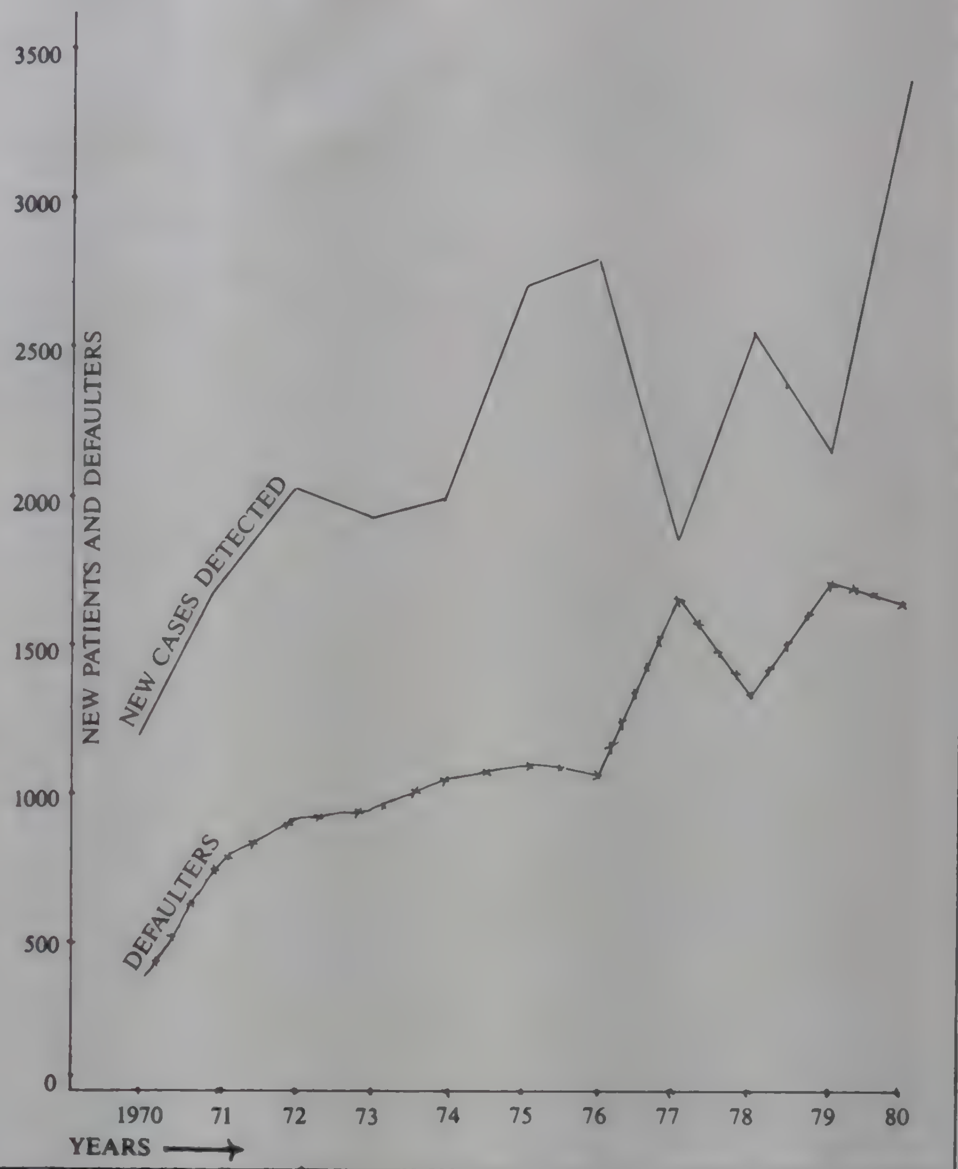
The relatively better off patients preferred treatment from private practitioners for which they had to pay. Often they could not afford to take regular treatment for the entire required duration and hence they tended to take treatment sporadically. Private practitioners often failed to tell the patients how long they would have to take treatment after they had been diagnosed for tuberculosis and often encouraged the belief in quick cures which sometimes led to doctor-shopping and irregular treatment.

These factors not only perpetuated the on-and-off pattern of treatment, and the consequent relapses and chronicity; they also strangely reinforced popular beliefs about the relative efficiency of the private sector *vis-a-vis* the public health system.

The findings of the first phase thus made it clear that there could be no simple explanations for poor case detection and extensive treatment defaults and failures based on the stupidity of patients or the inefficiency of public health institutions. Without taking into account the complex relationship between the private and public sectors there was no way to understand or rectify the persistent internal problems of the NTP, and a more broad based quantitative study was recommended to substantiate these findings.

*(b) The second phase:* In the second phase of the study twelve villages from Valsad district with a combined population of over 60,000 were selected, from which 959 patients had been registered with the DTC since its inception. One criterion for the selection of these villages was that from

GRAPH 2



each village at least thirty patients should have registered with the DTC. All the selected villages were within five kilometres of the National Highway or the Western Railway stretch between Valsad and Surat. The selected villages are therefore not representative of the district as a whole, one third of whose geographical area consists of hilly tracts inhabited by tribals with a different socio-economic and health background. However more than three-fourths of the population of the district is concentrated in the coastal strip where all the selected villages are located. They are thus representative of this populous and relatively prosperous part of the district. The methods used during this phase of the study were sociological and epidemiological-medical.

Three sources of information were utilised primarily. The first was a sociological survey of the villages, the second was the records of the DTC, and the third was interviews with surviving patients of tuberculosis. Interviews with the families of deceased tuberculosis patients and a medical survey of one village and the detection and interviewing of tuberculosis patients from villages which were not registered with the DTC, provided additional information. The first source provided the social and health-care background against which the socio-economic and cultural characteristics of the tuberculosis patients could be placed. The remaining sources helped in reconstructing steps taken to cure it and the treatment from the DTC as well as from private practitioners. It also examined the patients' beliefs and opinions about tuberculosis and their health status when interviewed. In all 402 patients of TB were interviewed.

The interviewed patients cannot be presumed to be representative of all tuberculosis patients who had registered at the DTC, since they consisted only of non-migratory residents who may also be supposed to have either a greater resistance to tuberculosis or a better acceptance of treatment from the fact of their having survived the disease. However the sample was sufficiently large to analyse quantitatively the utilisation of medical facilities and the patterns of treatment by different socio-economic groups.

## RESULTS AND DISCUSSION

Our main concerns for this discussion will be the catchment area or the social composition of the DTC patients along-with the patterns of access to the DTC, and the determinants of proper treatment. However a few facts about the performance of the DTC and of the patients registered there from the villages studied, may be in order.

Graph I depicts the diagonistic activity of the District Tuberculosis Control Programme in Valsad over the period 1970-1980, against a background of the expected prevalance of active tuberculosis and infectious cases estimated conservatively at 18 per 1,000 and 4 per 1,000 of population above 5 years of age, respectively. It is clear that even in its primary aim of treating a significant proportion of infectious cases, the control programme has not succeeded. The proportion of cases detected by the programme to the total number of probably active cases of tuberculosis in the district is of course woefully low and hence the impact of the control programme on the reduction of suffering caused by tuberculosis is negligible.

Case detection of the district centre is improving. Though more cases are detected there are more cases of infectious tuberculosis in the district. Also there are more and more defaulters, as Graph II shows. It is clear from Graph II that the detection of new cases has its ups and downs, perhaps due to changes in the staff of the centre, whereas the rate of defaulters shows on the whole a more steady rise.

As for the patients from the selected villages, Table 1 summarises the patients' final status in 1980 from the treatment cards.

On the basis of dates of drug collection visits to the DTC, the total length of period over which patients collected drugs from the DTC, and their regularity in doing so, were calculated. Regularity was stipulated as 80 per cent drug collection with no gap of over 10 days between the due date of collection and the actual date on which they were collected. Regularity was calculated only if the patient had collected drugs from the DTC for more than three months.

Table 2 shows that not less than 42 per cent of the patients stopped treatment from the tuberculosis centre within three months. Those who continued treatment beyond four months were likely to be irregular than regular. However more than one fourth of the patients had continued treatment for over a year, whether regularly or not.

Not all those who continued treatment beyond one year necessarily stopped treatment on medical advice though. Only 104 treatment cards were noted for complete treatment. The 250 who took treatment over a period exceeding one year therefore did not all ingest the required quantity of drugs. It may therefore be concluded that the DTC does not cover the active or infectious cases of tuberculosis which may reasonably be supposed to exist in the district. A majority of the patients whom it does cover neither complete their treatment nor take it regularly.

### WHO GOES TO THE DTC AND WHY

What are the social characteristics of persons who are not covered by the DTC? In order to find this out the socio-economic profile of the interviewed patients will be compared with that of the randomly selected households in the villages. The routes through which the different categories of patients find their way to the DTC will also be discussed in order to determine the relationship between the patients' socio-economic background, their prior (i e, pre-DTC) treatment history, and their mode of taking treatment.

By and large, the patients who are registered with the DTC are relatively poorer than the average inhabitants of the villages. First we will compare the data concerning medical expenditure in general incurred during the year preceding the study by the general sample of 569 households and the households of TB patients.

For the sake of brevity we can divide the households into three classes: those where no treatment was sought, those where only free treatment was sought, and those where some medical expenditure was incurred. The most striking part of the figures given in Table 3 is the difference between the sample and patients' households in the clustering towards absence of medical expenditure.

Free treatment is sought by the same proportion of households among the general population and among the patients. Medical expenditure is incurred by only half as many patients' households as sample ones, and the higher the expenditure the fewer the patients' households incurring it as compared to the general population.

No treatment is sought by over 50 per cent more patients' households than the sample ones. Since there is no reason whatsoever to assume that the members of the households in which tuberculosis patients live are healtheir, or less in need of treatment than those living in other households, we can safely conclude that those persons who registered at the DTC are more likely to be among the poor and dispossessed who cannot spend money on treatment, and therefore refrain from seeking treatment.

Taking into account housing as an indicator of economic status we can compare the patients' households with the sample households (Table 4). If we combine people living in huts, i e, housing of types 1 and 2—together as the poor, and the remaining as the not so poor—we can see that while in the general population the approximate ratio of the poor to the not so poor is 4:6, among tuberculosis patients it is 6:4.

Ownership of land among the sample households and the patients' households is compared in Table 5.

Table 5 shows that there are more landless among tuberculosis patients than among the general population, and once again, that among those owning some land, the larger the landholding, there are correspondingly fewer patients' households than sample ones.

Occupations of the heads of the sample and patients' households are compared in Table 6.

Compared to the general population, tuberculosis patients are more likely to belong to households where the head of the household is not gainfully employed or is a semi-skilled worker engaged in a petty, usually traditional craft, like carpentry, brick-laying, hair-cutting, or is a cobbler, washerman, gardener, midwife, or peddler. There are few businessmen, farmers, or government servants, among the patients' households. Surprisingly there are fewer agricultural labourers among the patients' households than among the sample. We will come back to this somewhat unexpected finding after first discussing some other indicators showing that by and large poorer groups are over-represented in the sample of DTC patients.

TABLE 7: CASTE-COMPOSITION OF SAMPLE GENERAL POPULATION AND SAMPLE DTC PATIENTS

| Castes | Per Cent in General Population | Per Cent Among Patients |
|---|---|---|
| Hindu | | |
| Upper | 19 | 10 |
| Middle | 33 | 28 |
| Lower | 36 | 46 |
| Muslims | 12 | 15 |
| Not available | — | 1 |

TABLE 8: HIGHEST EDUCATIONAL LEVEL IN THE HOUSEHOLDS OF SAMPLE OF GENERAL POPULATION AS COMPARED TO SAMPLE OF DTC PATIENTS

| Highest Educational Level in the Households | Per Cent among General Population | Tuberculosis Patients |
|---|---|---|
| Not educated | 14.0 | 8.5 |
| Primary | 13.2 | 11.7 |
| Secondary | 35.0 | 50.2 |
| Higher Secondary | 20.6 | 17.7 |
| College and above | 17.2 | 11.4 |

TABLE 6: OCCUPATION OF HEADS OF HOUSEHOLDS AS INDICATOR OF SOCIO-ECONOMIC POSITION IN SAMPLE OF GENERAL POPULATION AS COMPARED WITH SAMPLE OF TB PATIENTS

| Occupation of Head | Sample Households | | Patients' Households | |
|---|---|---|---|---|
| | Number | Percentage | Number | Percentage |
| No gainful occupation | 107 | 18.7 | 102 | 25.3 |
| Agricultural labour | 117 | 20.5 | 63 | 15.7 |
| Semi skilled or casual worker | 54 | 9.4 | 73 | 18.2 |
| Vendors | 29 | 5.0 | 28 | 7.0 |
| Mill workers | 51 | 8.9 | 22 | 5.5 |
| Industrial labour | 13 | 2.2 | 16 | 4.0 |
| Diamond polishing | 8 | 1.4 | 7 | 1.7 |
| Government service | 91 | 15.9 | 53 | 13.2 |
| Farming (landowner) | 53 | 9.3 | 23 | 5.7 |
| Professional | 16 | 2.8 | 8 | 2.0 |
| Business | 27 | 4.7 | 4 | 1.0 |
| Not available | 3 | 0.5 | 3 | 0.7 |
| Total | 569 | 100.0 | 402 | 100.0 |

Since there is convergence between class and caste categories in the villages, we can compare the caste composition of the general population with that of the patients. For the sake of simplicity the castes have been grouped into upper, middle and lower among the Hindus while all Muslims are considered separately. The lower castes subsume all scheduled castes and tribes.

Table 7 shows clearly that there are proportionately almost twice as many persons belonging to the upper castes in the general population as there are among patients registered at the DTC. There are more members of the middle castes too in the former than in the latter. However, the under privileged lower castes are over-represented among the patients, just as the Muslims are.

Finally we will compare the educational levels of the general population with those of the patients (Table 8).

Table 8 shows that patients are less likely to have reached higher educational levels than the sample population, but they are far from being uneducated; not only are they less likely to be uneducated, but proportionately more of them receive secondary education.

The statistical data make it clear that, among the patients, agricultural labourers as well as the group without any education at all are under-represented. To a great extent these two categories coincide in the rural areas. Only those who have some years of primary education can escape from the position of total dependency, characteristic of agricultural labourers, by finding jobs as unskilled labourers in factories or mills in nearby towns or industrial estates. The question therefore is why do the agricultural labourers seem to be left out from treatment at the DTC. To answer this question something must be said about the concept of culture and the accessability of government health institutions,

The concept of health culture,[10] implies that health-care behaviour of a community (or specific groups within a wider community) cannot be seen in isolation as an independent phenomenon. It is determined by ecological and cultural factors and by resource constraints. The agricultural labourers are the most downtrodden section of the village communities and they simply cannot afford to be ill. They often stated that they could not even visit a nearby PHC because going there and waiting—often for a long time—to see the doctor, means loss of a day's earning. Thus in many cases only when they are "sent" by their employer, it is possible for them to go to a doctor. When it is a "good" employer, in the feudal tradition, he will even pay for the services of a private practitioner. No agricultural labourer will be in a position to pay for a complete private treatment and neither is it likely that even a "good" boss will do so for him/her.

Banerji's (1981; 530) remark that "the suffering caused by TB is overwhelmed by suffering caused by other problems such as hunger and abject poverty", as well as a state of absolute dependence on others, holds especially true for this group. Seen from that angle it is not surprising that they are under-represented in the sample of patients. Though the services of the government health institutions are *especially meant for them*, they turn out to have limited access to these institutions. The awareness that they can go there is not strong enough and it is also not actively developed by either their employers or the personnel from peripheral health-care centres.

Similarly for the (often seasonal) migrant labourers the government health institutions are really the only source for medical treatment. The majority of them stay for a few weeks or months in the region. They do not know who are the doctors considered to be good. Neither have they any chance to find an employer who is willing to give them money to consult a private practitioner. Their chances of getting complete treatment for TB are also rather low. On the other hand those labourers (mostly belonging to the same lower castes) who work in factories have a much better chance to enter, by referral-channels, the government TB centre. Some sort of medical facilities are generally available for labourers in the bigger factories. And doctors who act as consultants for these factories refer them to the DTC.

The consciousness of symptoms of TB was high among the group of interviewed patients. 82 per cent of the patients mentioned weakness and loss of weight, cough or fever as symptoms which impelled them to take medical advice. Not less than 32 per cent mentioned haemoptysis as one of the reasons to see a doctor. Of the 398 patients who mentioned symptoms, 66 per cent were able to name four to six symptoms of which the three main ones always formed part. There were no significant differences in the awareness of symptoms between the different socio-economic groups. It is therefore reasonable to assume that the agricultural labourers are as likely to know which symptoms are indicative of TB, as any other group. Their pattern of action-taking as well as their condition at registration was, however, significantly different and needs some further analysis. Table 9 gives an overview of the condition of the patients at registration correlated with an indicator for socio-economic position, the highest educational level in the household. It shows that the higher the socio-economic position the higher the chance of the patient reporting when not yet very ill.

Though there is no significant overall relationship between patients' occupations and their physical condition at registration, in certain occupational categories there is an interesting clustering towards a poor physical condition (i e, inability to work at registration).

The most striking divergence between the general trend among all patients and those in a given occupational category, in terms of the physical condition at registration, was in the case of agricultural

TABLE 10: DIAGNOSTIC ACTION TAKEN AND ADVICE GIVEN TO PATIENTS AT FIRST VISIT TO PRIVATE PRACTITIONERS AS COMPARED TO THE SAME AT FIRST VISIT TO DTC

| | Diagnosis by Private Practitioners (Percentage) | Diagnosis at DTC (Percentage) |
|---|---|---|
| X-ray taken | 22 | 93 |
| Sputum examinations | 8 | 79 |
| Advised prolonged treatment | 15 | 74 |
| Advised to go to government TB centre | 8 | — |
| Information given that patient had TB | 20 | 73 |

TABLE 9: CONDITION OF PATIENT WHEN FIRST REGISTERED AT THE DTC IN RELATION TO HIGHEST EDUCATIONAL LEVEL IN THE HOUSEHOLD

| | All Per Cent | Highest Education Level in Households | | | |
|---|---|---|---|---|---|
| | | Secondary or Lower No | Per Cent | Higher Secondary or Higher No | Per Cent |
| Unable to work | 51.63 | 170 | 62.04 | 47 | 41.22 |
| Able to work | 47.34 | 104 | 37.96 | 67 | 58.78 |
| Not available | 1.03 | 9 | 2.00 | 3 | 0.07 |

labourers. Over 69 per cent of agricultural labourers. registered at DTC's when they were in no physical condition to work as compared to 52 per cent for all patients. Only 25 per cent of the agricultural labourers were still able to work, when they were registered at the DTC. Since most agricultural labourers came to the DTC without prolonged prior treatment—40 per cent with no prior treatment, 60 per cent with less than one week's treatment, 75 per cent with less than one month's treatment, about 90 per cent with less than three month's treatment, and none at all with more than six month's treatment—the reason for their poor condition at registration cannot be attributed to prolonged on-and-off prior treatment.

Another strong indication that agricultural labourers tend to come to the DTC at a late stage of their illness is found in the number of agricultural labourers who at the time of their first registration had extensive lesions, 36 per cent had bilateral lesions (while 27 per cent were also sputum positive) at first registration as compared to 19.5 per cent among the sample of interviewed DTC patients, and 24 per cent in the total sample of DTC patients.

This is an important finding which shows that it may be necessary to develop a differential approach to the various socio-economic groups who as a result of having different health cultures have different access to the DTC. Though the notion that the National Tuberculosis Programme should be based on a "felt need" may in itself be valid.[11] It is obvious that there should be a differential approach to various groups within the general public. The agricultural labourers for instance should get extra attention in order to enable them to make their needs felt.

## DETERMINANTS OF PROPER TREATMENT

A detailed analysis of the duration and regularity of treatment taken by the patients from the DTC and the patients' prior medical history indicates that two factors influence the pattern of treatment taken by the patients from the DTC. The first of these is the time lag between the onset of symptoms and the first medical action, and the second is the nature and duration of treatment taken prior to registration at the DTC. In general those patients who registered early on were more likely to take complete and regular treatment from the DTC.

In order to see how the socio-economic and cultural background of the patients is related to the manner in which they tend to take treatment we will compare the medical histories of different categories of patients. For this purpose we will describe those patients who registered at the DTC without any prior treatment as those who went to the DTC *directly* and those who took treatment earlier from one or more sources as those who went to the DTC *indirectly*. Moreover those who sought treatment from any source within one month of the onset of symptoms will be described as having sought treatment *quickly* and those who sought medical help more than one month after the onset of symptoms as having sought treatment *slowly*. The cut-off point for the latter distinction was kept at one month since it was found in the health survey of the population that respiratory complaints were by far the most common and hence even those who waited for as long as a month may still be said to have attended to their symptoms quickly.

Those who went directly to the DTC were not necessarily found to have been in better physical condition at registration, simply because more often than not they had not gone quickly. Those who went indirectly however, were seen to have been almost always in poor physical condition, even if their earliest medical action had been quick. This suggests that prolonged on-and-off treatment is not beneficial to the patients, judging from their condition at the time of registration. 72 per cent of the patients came indirectly to the DTC. Which again shows that the role of private practitioners in diagnosing TB is considerable.

Apart from the 27 per cent patients who had no previous treatment, another 30 per cent could not supply the details of their treatment prior to that of the DTC, due to memory constraints. In order to judge the diagnostic role of the DTC *versus* private practitioners it is necessary to know among the remaining 43 per cent how many were examined or treated for symptoms of tuberculosis, how many were referred to the DTC, and how many were merely given some tablets—presumably palliatives—without adequate examination or explanation.

Though more than two-thirds of the patients had been examined or treated by private practitioners before they registered at the DTC the actual details of their diagnosis and treatment prior to the DTC are most revealing as shown in Table 10.

The lack of a proper control-group of patients who had only been treated by private practitioners or consultants for chest-diseases and who never went to the DTC is possibly blurring the overall picture.[12] Still the data comparing the diagnostic activities carried out by private practitioners and at the DTC, make it clear that the effectiveness of diagnostic activities taken at the DTC was undoubtedly much greater. However, the vast majority of patients had initially approached private practitioners. Many private practitioners do not routinely carry out the necessary diagnostic tests for infectious tuberculosis like sputum examinations, especially so with patients who are unable to pay much, and rarely maintain proper records. They often did not inform the patients about the nature of the disease and the duration of treatment required. Moreover most patients cannot afford to pay for completing the required treatment and the economic base of the doctor-patient relationship encourages doctor-

TABLE 12: DURATION OF PRIOR TREATMENT AND COMPLETENESS OF SUBSEQUENT TREATMENT

| | More than 3 Months' Prior Treatment Percentage | Less than 3 Months' Prior Treatment Percentage |
|---|---|---|
| Completed treatment from the DTC | 36.36 | 40.60 |
| Did not complete treatment from the DTC | 37.87 | 26.39 |
| Discontinued with three months | 25.75 | 32.99 |

TABLE 11: DURATION OF TREATMENT IN MONTHS AMONG ALL REGISTERED PATIENTS AND AS CLAIMED BY INTERVIEWED PATIENTS

| Duration of Treatment Months | Number and Percentage of Patients | | | | | |
|---|---|---|---|---|---|---|
| | Registered | | Interviewed | | | |
| | | | Claims | | Treatment Cards | |
| | Number | Per Cent | Number | Percentage | Number | Percentage |
| 0 - 3 | 404 | 42 | 132 | 33 | 102 | 25 |
| 4 - 7 | 188 | 20 | 60 | 15 | 65 | 16 |
| 8 - 11 | 88 | 9 | 28 | 7 | 56 | 14 |

| Total | 959 | | 402 | | 402 | |

shopping which is inimical for prolonged and regular treatment.

Fluctutations in prices and in the production distribution of anti-tuberculosis drugs also affects treatment. In order to assuage the pharmaceutical industry the government has periodically raised the prices of essential drugs. Since tuberculosis is a poor man's disease this has also effectively removed many essential drugs from the reach of the patients' ability to pay for them. To the extent to which price revisions are unaccompanied by larger allocations to the NTP, primary health centres can afford to stock fewer drugs in smaller quantities.

Drug manufacturers prefer to produce larger quantities of second line drugs where the margin of profit is greater than that in front line drugs. They also persuade the medical profession to prescribe them more often on grounds of greater efficacy, though this implies that nothing is kept in reserve in case drug resistence develops.[13]

### DURATION AND REGULARITY OF TREATMENT

Treatment duration and frequency had been ascertained from the treatment cards by considering two things. One was the time lapse between the date of inception of treatment and the last noted date of drug collection on the card. The other was the average number of monthly drug collection visits records on the card. The latter had to take into account differences between regimens prescribed to the patients. In the interviews with the patients they had been asked exactly how long they had taken treatment from the district tuberculosis centre, and from other peripheral health institutions.

TABLE 13

| | Directly (Percentage) | Indirectly (Percentage) |
|---|---|---|
| Completed treatment from DTC | 60.60 | 48.98 |
| Did not complete treatment from the DTC | 39.39 | 51.01 |

TABLE 14: TREATMENT COMPLETION AND QUICKNESS OF MEDICAL ACTION AFTER ONSET OF SYMPTOMS

| | Within One Month (Per Cent) |
|---|---|
| Completed | 40.51 |
| Incomplete | 28.44 |
| Discontinued within three months | 31.03 |
| Excluding the last category: | |
| Completed | 58.75 |
| Incomplete | 41.25 |

While a few of the discrepancies between patients' claims and the records on their card were a result of problems in the collection and analysis of data, the bulk of them were caused by the constraints on the patients' memories, and other human limitations. When duration of treatment is divided into four intervals of three to four months each, the discrepancies between patients' claims and treatment cards diminish considerably. Table 11 correlates these discrepancies with different durations of treatment. Whereas in absolute terms there was agreement in only 13.5 per cent of the cases, a perceivable pattern emerges in interval terms. This pattern is not seriously disturbed by the residual discrepancies.

If we disregard the discrepancies between patients' claims and their treatment cards, some interesting observations can be made about the duration of the interviewed patients treatment. First of all, in terms of different durations of treatment, the interviewed patients are quite distinct from the entire population of registered patients. Among interviewed patients (i e, all still alive) there were fewer who discontinued treatment within three months, compared to all registered patients: 29 per cent (the average of the duration of treatment as stated by the patient and as recorded on the card) *versus* 42 per cent (among all registered patients). While 44 per cent of the interviewed patients took treatment for 12 months or more, compared to 26 per cent among all registered patients.[14]

Correlating the directness of the patients' approach to the DTC—both in terms of duration of prior treatment, and in terms of the number of doctors consulted prior to the DTC—with their treatment careers at the DTC, it can be seen that the more directly the patients go to the DTC, the greater are their chances of completing treatment from the DTC. In order to show this, we will make two assumptions both of which require some explanation.

The first assumption is that completeness of treatment is more important than regularity. This may seem to conflict with the point made earlier that on-and-off treatment is more likely to be harmful than beneficial, however for the data used here that needs additional clarification. For one, regularity of treatment is of little use until complete treatment is taken. Thus, a patients' chances of recovery are higher if he takes drugs for twelve months over a period of say eighteen months, than when he takes regular treatment within a period of three months and ten days. Secondly, our definition of regularity as over 80 per cent drug collection without a gap of over ten days is fairly strict, and hence most of those who completed treatment were irregular by this definition. Therefore we will here disregard regularity and only show that those who go directly to the DTC are more likely to complete their treatment, even if they do not do so regularly, in the strict sense of regularity stipulated.

The second assumption is that many of those who discontinued treatment within a period of three months, either did not need treatment at all, or no longer needed it. It is conceivable that some of those who discontinued treatment from the DTC within three months were either mistakenly diagnosed—since nearly 80 per cent of them felt healthy when interviewed —or had spontaneous recoveries. The reasons for excluding these cases from the analysis of the relationship between directness of approach to the DTC and the chances of treatment being completed from there, will become clearer from the Tables 12 and 13.

Examining first of all the relationship between the duration of prior treatment and the completeness of subsequent treatment from the DTC, we find the distribution as in Table 12.

It is seen that more of those who came relatively directly to the DTC discontinued treatment within three months. However, if these cases are excluded from consideration for the reasons explained above, then a more striking relationship emerges between those who completed their treatment and those who did not, from among all those who took treatment from the DTC for over 3 months (Table 13).

Thus it can be safely asserted that patients who came relatively directly to the DTC are more likely to complete their treatment, excluding the constantly recurring category of about 30 per cent who discontinue within three months.

We now have to show that those who go quickly—i e, relatively shortly after onset of symptoms—are also more likely to complete their treatment than those who go slowly, i e, after symptoms of prolonged duration. Once again we will disregard regularity of treatment for the time being, and show that the proportion of those who discontinue treatment from the DTC within three months is more or less constant—given directness of quickness of approach and, after excluding these early dropouts, the pattern of those who complete treatment and those who do not, becomes clearly visible in Table 14.

Since almost 29 per cent of the patients had been unable to remember how long they had had symptoms before they took any action, the relationship between quickness of action and completion of treatment is somewhat blurred. However, only about one third of those who took medical action after one year or more completed their treatment.

Examining the socio-economic composition of those who went directly to the DTC and those who went there after prolonged treatment from several doctors, not surprisingly, it was found that the poor tend to go directly, while the relatively better off go indirectly. A similar relationship obtains among the different socio-economic strata of those who go quickly and those who go slowly. Because of the ambiguous value of the patients own assessment whether he took "quick" action or "slow", the interpretation of these data asks for a lengthy discussion, which cannot be given here.

### CONCLUSION

The main conclusion of our research is that the private sector interferes with the state-organised TB care in a most unfortunate manner. There are frequent proposals[15] to involve general practitioners in the NTP to improve its coverage, the assumption being that ideally private practitioners can supplement the efforts of the state, given additional incentives and inputs. Otherwise, as things stand, private health-care runs a parallel course without impinging on state organised public health-care. However we find that private health-care facilities by their very existence and nature adversely affect the functioning of public health-care facilities.

Patients prefer to go to private practitioners for reasons of status and because they believe that private practitioners will give better treatment. As the majority of TB patients are poor they will however not be able to pay for a complete course of modern chemotherapeutic drugs. Private practitioners do not always make it clear that patients must take treatment for at least one year. Thus a general, though ill-founded, belief has come into existence that it is possible to recover from TB within a short time.

This belief activates doctor-shopping, the search for a "really good" doctor, and on-and-off treatment pattern so characteristic for the patients who do not go quickly and directly to the district TB centre, often with fatal results in the long run. Our data, on the other hand show that those who do go quickly and directly to the DTC have a comparatively better chance to recover fully from TB.

Though the performance of the DTC and its potential for making an epidemiological impact on TB is insufficient, the diagnostic and advisory activities of the DTC were shown to be far superior to those carried out by most private practitioners. While the organisation of defaulters-retrieval is also much better at the DTC and obviously also more successful, comparatively speaking. At the same time our research made clear that the poorest and most dependent section of the population, the agricultural labourers, were under-represented amongst the patients of the DTC, though for them government institutions are the only source of health-care because they lack the means to pay for any sort of private treatment. Thus consciousness of symptoms and a felt need for TB treatment is not sufficient reason for those (and many other) patients, to go to a primary health centre and/or the DTC, at an early stage of their illness.

This suggests the need for selective modification of the passive orientation of the NTP. The interaction between private practitioners and the NTP described here may be valid only for the area studied. However it is presented with a view to provoke discussion, further investigations, and suggestions for improving the situation.

## Notes

[The research reported here was sponsored by the University of Amsterdam, Directorate General Internationale Samenwerking, The Hague, and the Centre for Social Studies, Surat.]

1 G D Gothi, 'Presidential Address to the 36th National Conference on Tuberculosis and Chest Diseases', Baroda, November 1981, mentions 10.5 million patients.

2 The NTP developed as a result of several steps taken since the inception of the planning process for the development of health services infrastructure and facilities for medical education and research. These included the sample survey of tuberculosis in India carried out by the Indian Council of Medical Research (1955-58) which revealed that pulmonary tuberculosis was almost as rampant in villages as in cities and towns; the demonstration by the Tuberculosis Chemotherapy Centre, Madras, of the efficacy of domiciliary treatment for tuberculosis; and the setting up of the National Tuberculosis Institute in Bangalore which was specifically entrusted with the task of drawing up the NTP and undertaking research and training to facilitate the implementation of the NTP.

4 See, 'Trial of BCG Vaccines in South India for Tuberculosis Prevention', *Indian Journal of Medical Research*, 72 (1980), supplement.

5 ICMR, 'A Review of National Tuberculosis Programme', Report of ICMR Expert Committee (1975).

6 See, reference to footnote 1. According to a report in *India Today* (November 30, 1982) only 353 out of 421 districts in the country have a district tuberculosis programme. This report incidentally estimates the number of tuberculosis patients in the country at 15 million.

7 Reported in *India Today* cited above.

8 S Radhakrishna, 'National Tuberculosis Programme—Relative Mertis of Enhancing the Operational Efficiency of Different Components of the Treatment Programme', *Indian Journal of Tuberculosis*, XXX, 1, pp 3-8.

9 Table A shows the effect of improving the efficiency of the various components on the overall success, or the direct benefit from the treatment programme (* stands for a 20 per cent increase and + for a 40 per cent increase).

10 See, D Banerji, "Poverty, Class, and Health Culture in India", New Delhi (1981).

11 Apropos the notion of "felt need" orientation, see George M Foster, 'Community Development and Primary Health Care: Their Conceptual Similarities', *Medical Anthropology* 6.3 (1982). Foster gives evidence to indicate that the code expression "felt needs" was in common usage even forty years ago and goes on to add: "In retrospect it is clear that an uncritical insistence on a pure 'felt needs' approach has been an error. Villagers' perceptions of needs do not necessarily correspond with the steps that must be taken to satisfy these needs . . . programmes usually are not really organised to

TABLE A: LEVELS OF EFFICIENCY

*(Per Cent)*

| Components | Present Estimate | Hypothetical Estimates | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Case-finding | 30 | 30 | 30 | *50 | *50 | *50 | +70 | +70 |
| Case-holding | 35 | 35 | *55 | 35 | *55 | +75 | *55 | +75 |
| Chemotherapy | 75 | *95 | 75 | 75 | *95 | *95 | *95 | *95 |
| Overall success | 8 | 10 | 12 | 13 | 26 | 36 | 37 | 50 |

help meet felt needs expressed by villagers . . . If village-expressed felt needs fall within the range of what is offered, well and good. If not, the "felt needs" doctrine falls by the wayside and standardised programmes are pushed, with or without community interest (p 191).

12 Among the 18 private patients interviewed in one of the villages none lived in type I housing, and only three lived in type II housing. The remaining 83.33 per cent or 15 patients lived in superior housing, while only 39.3 per cent of the patients registered with the DTC lived in the two superior types of housing.

While only 16.9 per cent of the DTC patients owned any land, eight of the private patients or 44.44 per cent were land owners. Six of the private patients—or one-third of the total—owned over 2.5 acres of land, while among the DTC patients only 6.9 per cent owned over 2.5 acres of land. Among 10 of the remaining private patients who owned no land, 5 owned businesses or shops.

All the private patients were more literate than the DTC patients as a rule. None of the private patients were illiterate, or belonging to households where the highest educational level achieved was primary schooling only. 44.44 per cent belonged to households where the highest level of education achieved was higher secondary, college, or university training. Thus in terms of socio-economic position, the private patients were much better placed, compared to the DTC patients. Their health and treatment habits told a different story though.

While almost all the private patients had been X-rayed at some time or the other, only three had had sputum examinations at any time. In the case of three of the 18 patients, there was reason to doubt the diagnosis of tuberculosis. Among the remaining 15 patients, who were most likely to have been patients of tuberculosis, 5 or one-third were in poor physical condition when interviewed. As against this, only about 19 per cent of the DTC patients had looked and felt sick when interviewed. The sample of private patients is admittedly rather small for any firm generalisations, but it would seem that almost twice as many private patients as DTC patients were in poor physical condition when interviewed.

12 of the private patients—or two-thirds of the total—had visited more than one doctor. Half of these—or a third of the total—had visited more than three doctors each. *Only one of the 18 patients had completed one years' treatment*. Except for one other patient who took treatment regularly for 8 months, none of the other patients had been regular in taking treatment, even though some of them had been taking treatment on-and-off for period of several years.

Almost all the private patients distrusted the public health system and complained that using it involved loss of both time and prestige, even if it was free. Most of them believed in going from one doctor to another in order to get better, and they were convinced that private treatment—though expensive—was more effective, and thus more likely to effect quick cures than available at the DTC. The facts portray, as we have shown an utterly different picture.

13 See, Sevanti Ninan, 'Larger Government Aid for TB Cure Urged', *Indian Express*, Ahmedabad, October 12, 1982.

As against this serious under-production of frontline drugs, the imports of second line drugs have far outstripped officially estimated demands. It was estimated that in 1983-84 there would be a demand for seven tonnes of Rifampicin. However, 15 tonnes of Rifampicin were imported during 1981-82. Similarly with Ethambutol, against an officially estimated demand of 110 tonnes in 1983-84, 96 tonnes were imported during 1979-80, and an additional 23 tonnes were produced domestically.

14 The non-representative character of the interviewed patients becomes more clearly visible when the data obtained from the relatives of 38 dead patients are compared for their duration and regularity of treatment taking. As can be expected, only eight of the dead patients had taken treatment for a period of one year. That is only 21 per cent, as compared to 44 per cent among the 402 patients who could be interviewed when still alive had completed their treatment.

Similarly 20, or 53 per cent of the dead patients had taken treatment for less than three months as compared to 29 per cent among the sample of patients interviewed. Of the eight patients who had taken treatment from the DTC for a period of one year or more, two had died after completion of treatment from a non-tubercular disease after stopping treatment from the DTC. Of the six remaining patients 3 had died when they were being treated at the DTC. Thus adding to the ill-reputation of the DTC, as an institution where patients die when they are taking treatment there.

The same was true among the 20 patients who stopped within three months after starting their treatment at the DTC. Of them 7 or 35 per cent died within weeks, or less than three months after their registration at the centre.

Of all the 10 patients about whom sufficient information was available and who died when taking treatment from the DTC, 4 or 40 per cent had histories of long prior suffering from symptoms of TB and/or consultation of several doctors before coming to the DTC. These periods varied from one year to even five years, with intermittent visits to several private doctors.

Since they all died from TB, their histories show the bad effect of doctor-shopping and late reporting at the DTC. There are no certified medical records of these patients available, but there is every reasons to believe that their cases were already aggravated before they entered the DTC. As such the histories of these 38 patients, 36 of whom died of TB, illustrate the general trends discussed, without carrying any statistical significance.

## M P Carbide and Chemicals

M P CARBIDE AND CHEMICALS, promoted by the well-known Jelan Group of Calcutta and Madhya Pradesh State Industries Corporation (MPSIC), is setting up a Rs 9.68 crore project for the manufacture of calcium carbide with a capacity of 18,480 tonnes per annum in the 'no-industry' district of Panna in MP. The state government has declared the project as a 'pioneer unit' whereby it is eligible for several concessions and benefits. Calcium carbide is primarily used for generation of acetylene gas which finds wide application in the engineering industry. Commercial production is expected to commence in July 1985 and the company expects to achieve 60 per cent capacity utilisation in the first 10 months of operation. The company is making a public issue of 11.30 lakh equity shares of Rs 10 each at par to raise a part of the finance required for the project. The Merchant Banking Division of the Standard Chartered Bank is manager to the issue, while Allahabad Bank's Merchant Banking Division is acting as Advisor. The subscription list will open on June 10. The electric reduction furnace has been designed, manufactured and supplied by Engineering Projects India in collaboration with Mannesman Demag of West Germany. Its performance has been guaranteed by both the firms. The producer gas fired kiln is based on the design of Warmestelle Stein Und Erden, West Germany. The producer gas plant is based on the design of Kerabadarf Keramische Industries Bedarf, West Germany. According to M P Jalan, Managing Director, the project site is ideal on account of easy availability of raw materials and close proximity to the major consumers. The company's plant will be the only one in Central and Northern India to cater to the needs of consumers in the region. The company does not envisage any difficulty in marketing its entire production.

# Inflation and Incentive to Invest in Capital Assets

**Poonam Gupta**
**Sanjeev Gupta**

*The purpose of this study is to estimate the marginal effective tax rates for different asset classes and change in user cost with inflation. Such calculations enable a study of the effect of inflation and other allowances like depreciation, investment allowance, etc, on incentive to invest. The results show that the effective tax rates increase with inflation but at a decreasing rate. Secondly, inflation increases the dispersion in the effective tax rates causing the tax system to become more non-neutral. A tax system is then suggested which is neutral and compensates for the price increases.*

## I

## Introduction

A REVIEW of the trends in capital formation in India from 1950-51 reveals that the rate of capital formation increased from about 10 per cent of GDP at current prices to nearly 22 per cent by the end of the 1970s. The greater part of the increase took place in the period between the early 1950s and the middle of the 1960s. The subsequent increase was of a very small order from about 18 per cent to 22 per cent of GDP. An examination of sectoral trends reveals that the rising trend during the earlier half of the period (upto middle of 1960s) was mostly accounted for by the public sector. Capital formation in the private corporate sector continued to hover around two to three per cent of GDP in this period. The increase in the subsequent period, from mid 1960s to end of 1970s was accounted for mainly by the household sector. Capital formation in *real* terms in late 1970s was nearly the same as a percentage of GDP as in early 1950s in private corporate sector. Thus, there has been virtually no increase in private corporate sector capital formation in real or nominal terms, as a percentage of GDP for the past three decades.

The question which one may ask is, why has the performance of private corporate sector in capital formation been so dismal for as long a period as three decades even though tax provisions calculated to encourage investment like depreciation allowances, investment allowances and tax holiday have been provided. Of these, depreciation allowances are important from the point of eventual recovery of the sunk cost of investment and thus replacement of the existing asset. The current system followed by companies and other business organisations subject to taxation is to spread the historical or original cost over the effective life of the fixed assets. The tax law requires that the diminishing balance method be adopted to distribute historical cost. In this method, the prescribed rate of depreciation is applied to the written down value of assets which is the original cost of the asset less depreciation so far charged from year to year. The annual depreciation allowances are not adjusted when there are increases in the general price level with the result a higher rate of inflation, by lowering the real value of depreciation allowances on any asset investment, raises the net cost of investing. In India, depreciation allowances have been steadily eroded by inflation. Unless corporations make additional provision for replacement and expansion from their internal funds, the depreciated assets cannot be replaced from these allowances alone. If capital assets are not replaced, gross capital formation gets adversely effected.

It is frequently contended that the corporate tax rate in India is high. However, what is more relevant is not whether the statutory rate is high but whether the effective corporate tax rate is high. Here also it is the marginal and not the average effective tax rate that is relevant from the point of view of incentive to invest. Present value of expected taxes relative to expected income from marginal investment under consideration is defined as marginal effective tax rate.

The purpose of this study is to calculate the marginal effective tax rates under current tax provisions. Such calculations have not yet been made for India. Marginal effective tax rates are important because they are useful indicators of the effective tax burden on a marginal investment. They also help in studying the effect of inflation on the incentive to invest. The impact of the tax laws on different assets can be compared through marginal effective tax rates. For instance, different rates of depreciation and investment allowance result in variations in marginal effective corporate tax rates across assets. This, in turn, affects the pattern of demand for capital assets. Since inflation affects different assets differently, calculation of the marginal effective tax rates helps in a clearer understanding of the impact of inflation and distortions and misallocations introduced by it. Finally, a comparison of effective tax rates is important from tax neutrality point of view. Gravelle (1982) contends that a neutral tax system is one where marginal effective tax rates are the same across assets. Under these circumstances, the capital will be allocated in an efficient manner.

It has been asserted by some economists like Kopcke (1982) that the user cost is a more appropriate measure of investment incentives. Therefore we also study the impact of inflation in raising the user cost of capital.

Section II of the paper briefly describes the model used in the calculations. The results based on the 1984-85 tax laws are presented in the succeeding section, III. Conclusions and policy implications are taken up in Section IV.

## II

## The Model

The starting point for the derivation of the user cost of capital and effective rate of corporate taxation is the neo-classical model of optimal capital accumulation. The model assumes that a firm will invest a unit of capital upto the point where the present value of future receipts equals the cost of acquiring the asset. From this model, Jorgenson developed a measure for the rental price (or user cost) of capital. The rental price is defined as the price that would be paid to rent a new unit of capital or the price that a firm would impute to itself for the use of a new unit of capital.

The original formulation was altered subsequently by introducing inflation so as to distinguish between real and nominal rates of return. In the absence of taxes, the price per unit of capital is equated with the present discounted value of the future flow of receipts or profits in the following way:

$$q = \int_{0}^{\infty} c e^{-dt} e^{pt} e^{-(r+p)t} \, dt \quad \ldots (1)$$

where q = the acquisition cost

c = the rental price of a new unit of capital or the marginal rate of return to one rupee worth of increment in the capital stock

r = the real rate of return or discount rate

p = the expected inflation rate

d = the true rate of decay of output or the economic depreciation rate.

The expression implies that profits decline at the rate d, and increases with the general price level at the rate p.[1] The present value of all the future returns is calculated by discounting them at the nominal rate r + p.

Solving (1) yields

$$c = q\ (d + r) \qquad \dots (2)$$

Thus, in the absence of taxes, the rate of inflation, p, does not affect the value of c for a given acquisition cost, q.

For each rupee of investment (q = Re1), the rental price c equals the sum of the rate of return and the depreciation rate. For a given r, higher the values of d (or less durable the asset) the greater is the rental price.

Hall and Jorgenson (1967) also developed an expression for c when taxes are imposed. With corporate taxation, investment and depreciation allowances, the cost of a unit of investment is equated with the present discounted value of profits net of all taxes. The modified model is:

$$q = \int_0^\infty c\ (1 - u)\ e^{-dt}\ e^{pt}\ e^{-(r^* + p)t}\ dt + uq \int_0^\infty D\ (t)\ e^{-(r^* + p)t}\ dt + ukq$$

where u = the statutory corporate tax rate

D (t) = depreciation deduction allowed at time t per rupee of investment

k = the rate of investment allowance

r* = the real after tax discount rate or the real after tax cost of funds.

The depreciation and investment allowances have been multiplied by u because in India these allowances are adjusted against corporate profits to determine tax liability. If we define

$$\int_0^\infty D\ (t)\ e^{-(r^* + p)\ t}\ dt = z \quad \text{then}$$

$$q = \int_0^\infty c\ (1 - u)\ e^{-(d + r^*)\ t}\ dt + uqz + ukq$$

Solving the integral, we get

$$(1 - uz - uk)\ q = \frac{c\ (1 - u)}{r^* + d}$$

The left hand side of the above expression is the purchase price minus the present value of tax savings from depreciation and investment allowances. This can be called the net cost of the hypothetical investment project. This is equated with the present value of the after tax returns on the asset. If the two are not equal, profit seeking investors would drive up the cost of an asset or drive down the return until they become equal.

Solving for c gives

$$c = \frac{q\ (r^* + d) \quad (1 - uz - uk)}{1 - u} \quad \dots (4)$$

The rental price c, is also called the user cost of capital because in addition to the cost of funds, it includes the cost of asset depreciation and taxation. Comparing (2) and (4), we see that they differ by the ratio

$$\frac{(1 - uz - uk)}{1 - u}$$

The two factors, uk – uz and u, represent the extent to which the effective purchase price of capital is lowered by investment and depreciation allowances and the extent to which future cash flows are lowered by the corporate tax rate.

The equilibrium value of c is the same for both the gross and net return calculations. Substituting c = q (r + d) from (2) into (4), we get,

$$(1 - uz - uk)\ q = \frac{q\ (r + d) \quad (1 - u)}{r^* + d}$$

Solving for r, we obtain

$$r = \frac{(r^* + d)\ (1 - uk - uz)}{1 - u} \quad - d \quad \dots (5)$$

According to Auerbach (1983), r in (5) is the real cost of capital.

Nominal depreciation allowances do not change with the price level so they decline in real value with inflation. This causes an increase in the cost of capital. This is evident both from the user cost formula in (4) and the real cost of capital expression derived in (5).

The influence of inflation on the demand

TABLE 1: TAX DEPRECIATION RATES, INVESTMENT ALLOWANCE AND ECONOMIC DEPRECIATION RATES

*(Per Cent)*

| Asset Type | Tax Depreciation Rate[1] | Investment Allowance | Economic Depreciation Rate |
|---|---|---|---|
| 1 Plant and Machinery[2] | | | |
| (a) General rate | 15 | 25 | 12.25 |
| (b) Building contractors' machinery | 15 | 25 | 17.22 |
| (c) Mines and quarries-surface and underground machinery | 15 | 25 | 16.50 |
| (d) Electrical machinery-switch gear, instruments*, wireless apparatus and gear, wireless appliances and accessories | 15 | 25 | 11.79 |
| (e) Railway sidings, locomotives rolling stocks, tramways and railways used by concerns excluding railway concerns | 15 | 25 | 6.60 |
| (f) Office machinery, typewriters, accounting and calculating machines | 15 | 0 | 27.29 |
| (g) Data processing machines including computers | 20 | 0 | 27.29 |
| (h) Motor cars[3] | 20 | 0 | 10.00 |
| (i) Electrical machinery-batteries, X-rays, electro-therapeutic apparatus and accessories thereto | 20 | 25 | 11.79 |
| (j) Motor tractors, harvesting combines | 30 | 25 | 16.33 |
| (k) Aeroplanes—aircraft | 30 | 25 | 18.18 |
| (l) Aeroplanes—aeroengines | 40 | 25 | 7.86 |
| 2 Buildings[4] | | | |
| (a) General rate | 5 | 0 | 3.16 |
| (b) Factory buildings | 10 | 0 | 3.30 |
| 3 Ships (ocean going except fising vessels with wooden hull)[5] | 5 | 25 | 7.50 |

*Notes*: * Transformers and other stationary plant and wirings and fittings.

1 Tax depreciation rates are on the written down value of an asset.

2 All categories of plant and machinery except (f), (g), (h) and (k) are eligible for additional depreciation allowance.

3 We use economic depreciation rate of 10 per cent Hulten and Wykoff figure of 33.33 per cent seems too high for India.

4 Buildings are neither eligible for additional depreciation allowance nor for investment allowance.

5 Five per cent rate is on actual cost.

*Source*: 'Taxman' 1984 Edition.

price or user cost of capital as well as the real cost of capital depends on the sensitivity of the present value of depreciation allowances to changing inflation rates, $dz/dp$, as well as the importance of these allowances as a tax shelter, $(1 - uz - uk)$. It is the percentage change in the effective purchase price of capital, $q\,(1 - uz - uk)$ and user cost, c that influences investment incentives. The rise in user cost relative to zero inflation can be measured by taking the ratio $c_1/c_0$ where $c_1$ is the user cost at the given inflation rate and $c_0$ is the user cost at zero inflation rate. The ratio is simply $\frac{(1 - uz - uk)}{(1 - uz_0 - uk)}$ where $z_1$ and $z_0$ are the present value of depreciation allowances with the given and zero inflation rates respectively. This ratio is independent of the true rate of capital decay.

The effect of inflation in raising r can be further seen by comparing the cases where economic depreciation allowances are indexed and where they are not. With inflation and indexed deductions, depreciation allowed at time t is $de^{-dt}e^{pt}$. In the presence of taxes, the present value of depreciation deductions

$$z_e = \int_0^\infty de^{-dt}\,e^{pt}\,e^{-(r^*+p)t}\,dt$$

Solving the integral yields

$$z_e = \frac{d}{(r^* + d)} \quad \ldots (6)$$

For a fixed real discount rate, $r^*$, $z_e$ in (6) is fixed.

When depreciation allowances are based on prices in the year of purchase and are not adjusted for changes in prices, the present value of depreciation allowances is,

$$z_H = \int_0^\infty de^{-dt}\,e^{-(r^*+p)t}\,dt$$

Solving the integral and substituting the limits gives

$$z_H = \frac{d}{r^* + p + d} \quad \ldots (7)$$

$z_H$ in (7) declines with the rate of inflation. Substituting the value of $z_H$ in (5) and assuming investment allowances to be zero, we get the following expression for the real cost of capital.

$$r = \frac{r^*}{1 - u} + \frac{u}{1 - u}\,pz_H. \quad \ldots (8)$$

If we substitute (6) in (5) we get

$$r \neq \frac{r^*}{1 - u}$$

Thus, the cost of capital, r is higher when depreciation allowances are not indexed by an amount $\frac{u}{1 - u}\,pz_H$. Moreover the cost of capital increases with d. Thus the inflation discriminates against short lived assets. The bias is in favour of long lived assets with low values of d.

In the above analysis of the effect of inflation on depreciation and r, we have assumed investment allowances to be zero. With an investment allowance, k, the cost of capital in (8) will be

$$r = \frac{r^*}{1 - u} + \frac{udp}{(1 - u)\ (r^* + p + d)} - \frac{uk\,(r^* + d)}{1 - u} \quad \ldots (9)$$

Thus investment allowances lower r by an amount measured by the third term. Investment allowances are important both for the corporation and the policy maker. For the corporation they lower the cost of capital, for the policy maker it can serve not only as an instrument for channelling investment into desired assets but it is also a tool which confers differing benefits on assets with different asset lives even when the rate of allowance levied is identical. From equation (9) it is clear that the value of the third term is larger for larger values of d and therefore investment allowance favours short lived investments.

Thus investment allowance and use of historical cost method for calculating depreciation deductions produce offsetting distortions in the tax system. While, depreciation allowances at historical cost discriminate against short lived assets, investment allowances favour short lived investments.

Tax and economic depreciation rates may not necessarily be identical. If tax deductions decline at the rate T from year zero (as in the declining balance method in India), then the present value of deductions is given by the integral,

$$Z_T = \int_0^\infty Te^{-Tt}\,e^{-(r^*+p)t}\,dt$$

Solving the integral and substituting the limits as before gives,

$$Z_T = \frac{T}{r^* + p + T} \quad \text{and}$$

$$r = \frac{(r^* + d)\left(\frac{1 - uT}{T + r^* + p} - uk\right)}{1 - u} - d \ \ldots (10)$$

TABLE 2: THE PRESENT VALUE OF REAL DEPRECIATION ALLOWANCES PER RUPEE OF INVESTMENT[1]

(A) Plant and Machinery[2]

| Inflation Rate (Per Cent) | Tax Depreciation Rate (Per Cent) 15 | 20 | 30 | 40 |
|---|---|---|---|---|
| 0 | .4760 | .5047 | .5368 | .5546 |
| 2 | .4436 | .4795 | .5216 | .5456 |

| 10 | .1488 | .2368 | .1892 |
| 20 | .0982 | .1679 | .1175 |
| 30 | .0733 | .1300 | .0839 |

*Notes*: 1 Entries equal nominal depreciation allowances multiplied by .5775, the corporate income tax rate, discounted by the nominal after tax discount rate.

2 Nominal depreciation allowances are calculated using the declining balance method. Additional first year depreciation equal to one half of normal depreciation is included because many categories of plant and machinery are eligible for it.

3 The rate for ocean-going ships is 5 per cent of actual cost. The general rate for buildings and the rate for factory buildings is 5 and 10 per cent respectively of the written down value. No additional first year depreciation is allowed for these asset classes.

Inflation lowers the present value of the tax depreciation allowances and thus raises r. Greater the T, greater will be the value of $Z_T$ and lower will be the cost of capital.

Two assets may have identical, K, T, r* and u but the cost of capital will differ so long as economic depreciation rates are different. The other point worth noting is that if $T > d$, then corporations are better off under the tax depreciation scheme *vis-a-vis* economic depreciation rules. Simplifying equation (10), we get,

$$r = \frac{r^*}{1-u} - \frac{ur^*(T-d)}{(1-u)(r^*+p+T)} + \frac{udp}{(1-u)(r^*+p+T)} - \frac{uk(r^*+d)}{1-u} \quad \ldots (11)$$

The second term in (11) measures the lowering of r on account of T being greater than d, or *vice versa*. With T>d, it also follows that indexed tax depreciation confers larger benefits on corporations than indexed economic depreciation. With indexed tax depreciation, assuming $k = 0$,

$$r = \frac{r^*}{1-u} - \frac{ur^*(T-d)}{(r^*+T)(1-u)} \quad \ldots (12)$$

With indexed economic depreciation, we may recall that,

$$r = \frac{r^*}{1-u}$$

The pre-tax return in (12) is less than the pre-tax return with indexed economic depreciation by an amount measured by the second term in (12).

The effective corporate tax rate is defined as the wedge between the rate of return on investment and the rate of return on savings used to finance that investment. It involves comparing r obtained in equation (5) with r*. If we denote the effective corporate tax rate by u* then

$$u^* = \frac{r - r^*}{r} \quad \ldots (13)$$

Expression (13) above needs to be interpreted with caution. If a subsidy is large enough, the required pre-tax returns can turn negative. The negative expression in the numerator is then divided by a negative pre-tax return. The resulting positive number is difficult to interpret. This problem can, however, be solved by using only the numerator or "effective tax wedge" interpreted as a percentage of the asset value paid in tax each year.

The next section presents the proxies used, the results obtained and their analysis.

## III

## Estimates Based on 1984-85 Asset Classes and Tax Rates

Three asset classes were used for analysis—plant and machinery, buildings and ships. Twelve asset categories were chosen from asset class, plant and machinery, two from buildings and one from ships. The asset classes along with asset categories are listed in column 1 of Table 1. The 1984-85 tax depreciation rates and investment allowance rates are shown in columns 2 and 3 respectively of Table 1. The rates of economic depreciation (column 4), defined as decline in asset value with age taking account of inflation, are chosen from Hulten and Wykoff (1981) after a careful comparison of the asset categories as defined in India and as defined by Hulten and Wykoff.[2]

The rates do not seem to be implausible for India though one would expect economic lives to be longer. For example, a 12.5 per cent geometric decay for the general category of plant and machinery implies an economic life of 16 years on the straightline method (Mervyn and Fullerton, 1984). Though the depreciation rate for the general category is not strictly comparable with that for agricultural plant and machinery, for which systematic estimates in India exist, it is nevertheless illuminating to compare them. The working group on Savings (1982) reports that 11 per cent of the value of the stock of such assets depreciates annually. Thus, a 12.5 per cent economic depreciation rate does not seem to be too unreasonable. This belief is confirmed if we note from Table 1 of the report that for registered manufacturing the average age of assets is about 20 years. This implies a geometric decay rate of 10 per cent because it can be shown that if economic life according to straightline depreciation is L then this can be approximated by an exponential rate given by 2/L (Mervyn and Fullerton, 1984).

We assume that there is no resale and that the asset is held until retirement. We include additional first year depreciation allowance at the rate of one-half the amount admissible as normal depreciation allowance for the assets eligible for it. Though the additional depreciation allowance was to be allowed

TABLE 4: THE NET COST OF INVESTMENT IN PLANT AND MACHINERY, BUILDINGS AND SHIPS WITH EXISTING LAWS AND ZERO INFLATION

| | Tax Depreciation Rate (Per Cent) | Net Cost of Investment |
|---|---|---|
| A Plant and Machinery | 15 | .3796 |
| | 20 | .3509 |
| | 30 | .3188 |
| | 40 | .3010 |
| B Buildings | 5 | .6928 |
| | 10 | .5990 |
| C Ships | 5 (on actual cost) | .4718 |

TABLE 3: PERCENTAGE DECLINE IN THE PRESENT VALUE OF REAL DEPRECIATION ALLOWANCES PER RUPEE OF INVESTMENT[1]

(A) Plant and Machinery[2]

| Inflation Rate (Per Cent) | Tax Depreciation Rate (Per Cent) 15 | 20 | 30 | 40 |
|---|---|---|---|---|
| 0 | | | | |
| 2 | 6.81 | 5.00 | 2.82 | 1.62 |

| 20 | 34.00 | 29.10 | 37.93 |
| 30 | 25.36 | 22.57 | 28.61 |

*Notes*: 1 The percentage decline has been calculated relative to the previous inflation rate.
2, 3 See notes 2 and 3 of Table 2.

for some categories of plant and machinery installed between March 31, 1980 and April 1, 1985, we assume that it is continued in the rest of the 1980s. We however do not take account of the extra shift allowance on plant and machinery that has worked double or multiple shifts as it is not feasible to do so within the given framework.

The theoretical model presented in section II assumes that receipts and tax deductions begin at time zero and occur continuously over time. The present value of depreciation under this approach is approximately the same as would occur with discrete annual discounting where the first year is discounted as a full year and so on.

Following Auerbach (1983), for calculations of the effective corporate tax rate, u*, we assume an asset to be equity financed and compare the resulting r* with r. For an equity financed investment, r* is the after tax return on equity. For the 1980s, it is the expected profits after tax as a percentage of net worth (RBI Bulletin, July 1983). We proxy this by average profits after tax as a percentage of average net worth of medium and large non-financial public limited companies for the period 1960-61 to 1980-81 as given in various issues of RBI Bulletin. This average turns out to be 10.6 per cent.[3] Since this return is in nominal terms, we need to subtract the average inflation to obtain the return in real terms. Average inflation must reflect the underlying rate that prevailed in the period 1960-61 to 1980-81 after adjusting for unexpected or exogenously induced upward or downward swings (Hendershott and Hu, 1981). The average inflation rate was calculated after excluding the years 1966-67 (devaluation), 1973-74 (first oil shock), 1975-76 (emergency), 1978-79 (second oil shock) and 1979-80 (drought year). The average underlying 'true' inflation rate is estimated to be 6.2 per cent giving a real after tax return of 4.4 per cent. This number is close to the estimate by Hendershott and Hu (1981) for the USA. They found the real return series to be a stable series fluctuating between 4.5 per cent and 5.5 per cent.

We present estimates under three rates of inflation, eight per cent, 10 per cent and 15 per cent. The World Bank has predicted an inflation rate of around eight per cent for the eighties. 10 per cent is the average inflation rate that prevailed in the period 1970-71 to 1980-81. 15 per cent is an ad hoc figure, included to test the sensitivity of the estimates for varying rates of inflation. The proxy used for inflation rate is the percentage change in the consumer price index. The rationale for using the CPI is that investors forego consumption when they invest and their cost in terms of foregone consumption should be recognised in subsequent depreciation.

The corporate tax rate inclusive of surcharge assumed for the 1980s is 57.75 per cent. This is the average corporate tax rate levied on public limited companies during the period 1970-71 to 1980-81.

Tables 2 and 3 show the present value of real depreciation allowances per rupee of investment and the percentage decline with inflation respectively for different tax depreciation rates admissible under the 1984-85 tax law. Many are eligibe for the first year's additional depreciation allowance. Where this is the case, the general formula used in the calculations presented in the tables, for a particular rate on plant and machinery is:

$$Z^P = \frac{3}{2}T + (1 - \frac{3}{2}T)\, T \left( \frac{1}{T + r^* + p} \right)$$

Where $p = 0, 2, 4, 6, 8, 10, 20, 30$ and $T = 15, 20, 30, 40$.

For buildings where additional depreciation allowance is not admissible, the formula used is:

$$Z^B = \frac{T}{T + r^* + p}$$

Where $p = 0, 2, 4, 6, 8, 10, 20, 30$ and $T = 5, 10$.

For ships, Z is calculated as:

$$Z^s = \frac{1}{L\,(r^* + p)} \left(1 - \frac{1}{e^{(r^* + p)L}}\right)$$

where $p = 0, 2, 4, 6, 8, 10, 20, 30$, and L is the implicit tax life.

It is clear from Tables 2 and 3 that

(a) the present value of depreciation allowances is lower for assets having a lower tax depreciation rate. Thus with 10 per cent inflation, the present value per rupee of investment in plant and machinery at 15, 20, 30 and 40 per cent tax depreciation rates is 35.8 paise, 40.8 paise, 47.5 paise and 51.6 paise respectively.

(b) rising inflation reduces the present value of real depreciation allowances. Thus at 15 per cent tax depreciation rate, the present value at 0, 10, 20 and 30 per cent inflation rates is 47.6 paise, 35.8 paise, 30 paise and 26.6 paise respectively.

(c) the rate at which the present value declines falls with an increase in the inflation rate. For a 15 per cent tax depreciation rate, when inflation increases from zero to two per cent, the present value of allowances falls by 6.81 per cent. A further two point increase from two to four per cent leads to a decline in present value by 6.04 per cent.

(d) with inflation, the value of depreciation allowances drops at a *faster* rate for assets

TABLE 5: INFLATION AND INVESTMENT INCENTIVES[1]

(A) Plant and Machinery[2]

| Inflation Rate (Per Cent) | Tax Depreciation Rate (Per Cent) 15 | 20 | 30 | 40 |
|---|---|---|---|---|
| 0 | 1.00 | 1.00 | 1.00 | 1.00 |
| 2 | 1.086 | 1.07 | 1.047 | 1.030 |
| 4 | 1.156 | 1.134 | 1.090 | 1.057 |
| 6 | 1.215 | 1.187 | 1.129 | 1.082 |
| 8 | 1.266 | 1.234 | 1.164 | 1.106 |
| 10 | 1.310 | 1.274 | 1.195 | 1.127 |
| 20 | 1.463 | 1.426 | 1.319 | 1.215 |
| 30 | 1.554 | 1.522 | 1.405 | 1.279 |

(B) Buildings and Ships[3]

| Inflation Rate (Per Cent) | Tax Depreciation Rate (Per Cent) |  |  |
|---|---|---|---|
|  | Buildings |  | Ships |
|  | 5 | 10 | 5 |
| 0 | 1.000 | 1.000 | 1.000 |
| 2 | 1.0777 | 1.0816 | 1.123 |
| 4 | 1.1323 | 1.1454 | 1.221 |
| 6 | 1.1727 | 1.1968 | 1.299 |
| 8 | 1.2038 | 1.239 | 1.360 |
| 10 | 1.2285 | 1.274 | 1.410 |
| 20 | 1.3016 | 1.389 | 1.564 |
| 30 | 1.3376 | 1.4524 | 1.636 |

*Notes*: 1 Entries equal the ratio of the user cost of capital when inflation is greater than 0 per cent to the user cost of capital when the inflation rate is zero. The figures are independent of the pattern of 'true' capital decay or the rate of economic depreciation as inflation alters the relative user cost through the factor (1 – UZ – UK)

2 K = 25 per cent and additional depreciation allowance is assumed to be admissible.

3 K = 0 for the asset classes buildings and ships. No additional first year depreciation allowance is allowed.

having a lower tax depreciation rate. This is obvious if we compare columns 2, 3, 4 and 5 of Table 3A, and columns 2 and 3 of Table 3B. Therefore, the relatively modest role of depreciation allowances in cash flow accruing to capital having a lower tax depreciation rate does not mean that these assets are necessarily less sensitive to changing inflation rates than assets having a higher tax depreciation rate. In fact, assets having a smaller tax depreciation rate are more sensitive to inflation than assets having a larger tax depreciation rate.

In the case of buidlings and ships, the sensitivity to inflation is greater than for the asset class plant and machinery, both because of lower tax depreciation rates and also because the additional first year's depreciation allowance is not applicable.

For a given after tax return, marginal corporate tax rate and economic depreciation rate, the user cost of capital services is proportional to the net cost of investment. The rise in the user cost with inflation, can thus be measured by a corresponding rise in the net cost of investment. The net cost to a firm of acquiring one rupee equivalent of plant and machinery, building or ships in the absence of inflation is shown in Table 4. The table shows that decreases in the tax life of an asset lower the net cost of investment. Also, the net cost of a given investment in building is higher than the equivalent investment in plant and machinery. This reflects the eligibility of plant and machinery for the additional first year depreciation allowance, higher tax depreciation rates and the benefit of investment allowance. The results displayed in the table suggest that at 15 per cent depreciation rate, the cost of investing a rupee is approximately 38 paise.

The rise in the net cost of capital *vis-a-vis* zero inflation rate is given in Table 5. Inflation causes a substantial rise in the net cost of investment at all tax depreciation rates. The results also indicate that the tax shelter offered by depreciation allowances is sufficiently important for capital with lower tax depreciation rates so that higher inflation increases the user cost of capital for these assets more than that of capital with larger tax depreciation rates. As annaul inflation rates rises from zero to six per cent, other things being equal, investment incentives for assets with 15 per cent tax depreciation rates fall by 21.5 per cent, but incentives for 20 per cent tax depreciation rates fall only by 18.7 per cent. Intuitively, this is because the smaller the tax depreciation rate, the larger is the tax life and, thus, more inflation may "discount" the value of the allowances before they may be claimed. Hence, high inflation rates discourage the purchase of assets with smaller tax depreciation rates *vis-a-vis* greater tax depreciation rates and bias the pattern of investment in favour of assets with shorter tax lives.[4]

A comparison of parts A and B of Table 5 reveals that the rise in the user cost for building with a five per cent rate is less than the rise in plant and machinery with 15 and 20 per cent tax depreciation rates. Also, for buildings the percentage rise with 10 per cent rate is more than the rise with a five per cent rate. We may recall from Table 4 that the ineligibility of buildings for investment allowance and additional first year depreciation allowance results in a higher absolute net cost of investment *vis-a-vis* plant and machinery at zero inflation rate. A lower depreciation rate for buildings implies a greater absolute increase in net cost (relative to zero inflation) *vis-a-vis* plant and machinery, but the effect of higher net cost at zero inflation for buildings is stronger and more than off-sets the effect of lower depreciation rate so that the percentage rise with inflation in user cost of building is relatively less than for some asset categories of plant and machinery. The case of buildings, is similar where the absolute net cost of investment for buildings to which a general rate of five per cent is applicable, is higher when compared to factory buildings with 10 per cent depreciation rate at zero inflation. In summary, with current Indian Income Tax codes, which link depreciation allowances to the original purchase price of capital assets, changing inflation rates alter the relative user cost of capital, other things being equal. We find that higher inflation generally raises the user cost more for assets with longer tax lives *vis-a-vis* assets with shorter tax lives. This distorts the choice between short and long-lived plant and machinery, thereby reducing the productivity of the capital stock. Apart from this differential effect of inflation and consequent substitution between varieties of capital goods, higher user cost for all assets by making investment less profitable reduces the rate of capital formation.

The effective tax rates by asset type are given in Table 6 again for inflation rates of 8, 10, and 15 per cent. Table 6 shows that inflation raises effective tax rates for all asset classes and asset categories by eroding the value of deductions based on historical cost. Also, for a two percentage point increase in inflation from 8 to 10 per cent the effective tax rate goes up by more than two per cent except for asset categories (f), (g) of plant and machinery and the general category of asset class buildings. However, it is important and interesting to note that as inflation increases, effective tax rates increase

TABLE 6: EFFECTIVE TAX RATES BY ASSET TYPE (1984-85 TAX LAW)

| Asset Type | Inflation Rate (Per Cent) | | |
|---|---|---|---|
| | 8 | 10 | 15 |
| 1 **Plant and Machinery** | | | |
| (a) General rate | 34.24 | 40.14 | 49.18 |
| (b) Building contractors' machinery | 40.33 | 46.70 | 55.68 |
| (c) Mines and quarries—surface and underground machinery | 39.52 | 45.70 | 54.84 |
| (d) Electrical machinery—switch gear and instruments, transformers and other stationary plant and wirings and fittings, wireless apparatus and gear, wireless appliances and accessories | 33.61 | 39.45 | 48.47 |
| (e) Railway sidings, locomotives, rolling stocks, tramways and railways used by concerns excluding railway concerns | 25.60 | 30.70 | 39.00 |
| (f) Office machinery, typewriters, accounting and calculating machines | 81.68 | 82.83 | 84.74 |
| (g) Data processing machines including computers | 79.03 | 80.48 | 83.08 |
| (h) Motor cars | 63.13 | 65.18 | 62.05 |
| (i) Electrical machinery—batteries, X-rays, electrotherapeutic apparatus and accessories thereto | 8.38 | 17.08 | 32.30 |
| (j) Motor tractors, harvesting combines | −134.91 | −85.65 | 28.02 |
| (k) Aeroplanes—aircraft | 22.95 | 34.27 | 50.03 |
| (l) Aeroplanes—aeroengines | −144.72 | −121.66 | −83.33 |
| 2 **Buildings**[4] | | | |
| (a) General rate | 62.60 | 63.65 | 65.12 |
| (b) Factory buildings | 56.52 | 58.54 | 61.22 |
| 3 **Ships** (ocean going except fising vessels with wooden hull | 58.45 | 60.95 | 64.78 |

but at a decreasing rate. This is because the real value of depreciation allowances fall at a reduced rate.

A striking result is the extent to which effective tax rates differ across investments because of the pattern of depreciation and investment allowances. Effective tax rates are the highest for categories eligible only for depreciation allowance, like (f), (g), (h) and asset class buildings. Difference in effective tax rates for categories (f) and (g) reflect the difference in tax depreciation rates alone because variables (d) and (k) are identical for both. Under existing laws (j) and (l) receive extremely generous treatment. For categories (j) and (l) effective tax rates are highly negative implying that they receive more from the government by way of different allowances than they pay in taxes. A high rate of depreciation allowance (30 and 40 per cent respectively), additional first year depreciation allowance and investment allowance combine to give present value of benefits per rupee of investment that exceeds one. Tax payers thus receive implicit subsidies. For ocean going ships the effective tax rates are higher than the statutory rate, particularly at 15 per cent inflation.

The other important aspect to note is that the historical cost basis, by discriminating against assets with short economic lives, results in higher effective tax rates for these assets. For example, within the asset class, plant and machinery for categories (g) and (h) effective tax rates are higher for (g). If effective tax rates for categories, (b) to (e) are compared we see that effective tax rates are lowest for (e) and highest for (b) though both have the same allowances. The fact that the shortest lived investment is (b) and the longest lived is (e), implies that the effect of historical cost basis which favours long lived investments outweighs the effect of investment allowance which favours shorter investment lives.

Finally, in Table 6 it would be interesting to compare effective tax rates across the three inflation rates to see how inflation affects differential tax rates. We pointed out earlier that this analysis is important from the neutrality point of view. Effective tax rates under all three inflation rates vary considerably. These variations in effective tax rate suggest potential for non-neutral allocation of resources. Hulten and Wykoff (1981) too contend that the uneven distribution of incentives, by creating differential tax burdens, results in inequities.

The source of tax differential was explored by measuring the independent effect of historical cost basis. This was done by assuming that the investment allowance for the admissible categories are repealed. The effective tax rate so calculated for 10 per cent inflation rate are given in the columns of Table 7. These rates can also be compared with rates obtained by indexing the tax depreciation allowances to inflation which are presented in column 3 of Table 7. If the economic rates of depreciation are indexed, we saw in section II that this would result in effective tax rates equal to the statutory rate. To facilitate direct comparison across assets, these rates are displayed in column 4 of Table 7.

It is clear that the repeal of investment allowance would substantially reduce the variations in tax rates and contribute towards a more neutral tax system. Indexation does not significantly effect the variation in effective tax rates. It is however important to point out here that if we assumed that investment allowances continue at the same rate but depreciation allowances are indexed then indexation would magnify the variations in rates. The variation is the minimum under a scheme of indexed economic depreciation.

Table 7 also shows purely the effect of inflation in raising effective tax rates by ignoring investment allowances. An increase in the inflation rate from 0 to 10 per cent increases the effective tax rate by about 17 to 19 per cent for categories 1(a) to (e), by 13 per cent for (f), 16 per cent for (g), 21 per cent for (h), 22 per cent for (i), 21 per cent for (j), 22 per cent for (k), 15 per cent for (l). For ships and factory buildings the increase is about 16 per cent. For a few asset categories like (e), (i) and (l), the effective tax rates under 1984-85 tax depreciation rates are less than even the indexed economic depreciation. For asset categories like (f) and (g) the effective tax rates under current law are substantially higher than indexed economic depreciation because the tax depreciation rate is much lower than the economic rate.

## IV

## Conclusions and Policy Implications

The results from this study show that, first, effective tax rates increase with infla-

TABLE 7: EFFECTIVE TAX RATES UNDER 1984-85 TAX DEPRECIATION RATES AND INDEXED ECONOMIC DEPRECIATION[1]

| Asset Type | 1984-85 Tax Depreciation Rate | | Indexed |
|---|---|---|---|
| | 10 Per Cent Inflation | Indexation | Economic Depreciation[3] |
| **1 Plant and Machinery** | | | |

tion at a decreasing rate. This is because as inflation increases the real value of depreciation allowances falls at a diminishing rate. Secondly, inflation increases the dispersion in effective tax rates causing the tax system to become more non-neutral.

A desirable tax criterion is that where real tax payments are unaffected by changes in the price level. This criterion is violated by the existing tax system as indicated by the results of this study. Stiglitz (1976) has pointed out that it is important for depreciation policies to be equitable. Efficiency criterion requires that rules for depreciation allowances not affect the choice of investment. Tax depreciation allowances which do not reflect actual economic depreciation and which are not adjusted for inflation tend to be inefficient.

Although, ad hoc corrections in depreciation allowances or other benefits are an imperfect substitutes for indexing which offsets completely the inflationary impact, the problems associated with indexation are several. With partial indexation plans, capital intensive industries employing long lived assets gain the maximum. This leads to an allocation of resources favouring these industries and discriminating against others. But, since indexed allowances have to be offset against gross profits, even slow growth capital intensive industries may not be able to realise the tax benefit of allowances. Indexation can also lead to economic instability because demands by other sectors for similar price adjustments can set in motion a price spiral and defeat the very purpose of indexation. At the same ime an inequitable distribution of tax liabilities would result if price level adjustments are not carried out for other sectors. The most important problem with indexation, especially for developing economies, is in the usage of appropriate indices which reflect replacement cost. While one time adjustments may be based on appraisal of the market value of assets, continuous adjustment requires the usage of indices that mirror market values and changes in it. Different classes of assets, buildings, plant and machinery, ships, land, even various asset categories in these classes would have to be revalued using specific indices for each. Thus the effectiveness of indexation policy hinges upon the accuracy of the indices employed, which in turn depends on the availability of appropriate data base. This is likely to be the major obstacle to the use of indexation.

Acceleration of depreciation allowances which shorten the tax life of assets cannot eliminate the effect of price level changes completely. It can only offset the effect of inflation somewhat. Adequate correction will take place only for a specified inflation rate. If the rate changes then the acceleration proposal has to be modified. While acceleration can also lead to inequities, the discrimination among corporations is such as to favour rapidly growing corporations because these will generate larger depreciation charges and lower tax liabilities. But such discrimination is in the right direction. Moreover, the acceleration principle is

highly flexible and administratively easier to implement. The policy-maker however has to use acceleration techniques with caution. He must be aware that when depreciation allowances are accelerated, the decline in asset value is faster than would be dictated by the decline in productivity alone. So assets with identical productive characteristics would *differ* if the rates at which their allowances are accelerated differ. The other important aspect for the policy-maker to note is that accelerated rates bear little or no resemblance to true economic depreciation rates and are fixed in a rather ad hoc fashion. So any set of rates are difficult to justify. A policy-maker can be faced with numerous proposals without having at his disposal any set of criteria by which to judge them and thereby choose one in preference to others.

In the light of the estimates and results derived we suggest the following reforms in the Indian tax system:

—Raise all tax depreciation rates on plant and machinery which are lower than 30 per cent to 30 per cent. Let the 40 per cent tax depreciation rate remain at 40 per cent. Assets with low tax depreciation rates, we saw, are more sensitive to inflation and also have high effective tax rates. By accelerating these lower rates to 30 per cent inflation's adverse impact will be lessened. The real cost of capital and effective tax rates will fall considerably thereby stimulating capital formation. It is also suggested that the depreciation rate for factory buildings be increased to 20 per cent and for ocean-going ships to 10 per cent of actual cost. Thus we are proposing acceleration rather than indexation to counteract inflation.

—Abolish additional depreciation allowance to simplify the tax system and increase neutrality.

—Raise investment allowance from 25 per cent to 30 per cent and let its scope be enlarged to include all asset categories of the asset class, plant and machinery. We advocate a rise in the rate of allowance for three specific reasons: (a) To compensate for the loss of additional depreciation allowance; (b) To lower effective tax rates which rise with inflation. Our results showed that if investment allowance was repealed, real cost of capital and effective tax rate would shoot up dramatically. With no investment allowance there is no offset to historical cost basis; (c) To provide additional incentive for short lived assets. Investment allowance, we showed, favours assets with short economic lives.

TABLE 9: EFFECTIVE TAX RATES BY ASSET TYPE IN USA

| Asset Type | 6 Per Cent Inflation Rate | | 9 Per Cent Inflation Rate | |
|---|---|---|---|---|
| | ADR | ACRS | ADR | ACRS |

| 28 Farm structures | 41.1 | 35.8 | 43.7 | 38.8 |

*Source*: Gravelle (1982).

With the rapid change in technology, the rate of obsolescence increases or economic life gets shorter, Inflation would wreck havoc with such assets and additional compensation must be provided. A policy-maker should however take note of the fact that the rate of obsolescence is rarely even across asset categories. Technology is bound to progress more rapidly for some assets than others. If deemed administratively practical we can have graduated rates, possibly two. Asset categories with a higher obsolescence rate can thus be made eligible for a higher rate of investment allowance. However a higher rate of investment allowance should not necessarily combine with a higher rate of tax depreciation. In the US, with the new Accelerated Cost Recovery Scheme, light vehicles with a life of three years are eligible for a six per cent credit only, whereas equipment with a life of five years is eligible for a credit at the rate of 10 per cent. Intuitively, it makes sense to give higher allowance to assets with a lower tax depreciation rate. Numerous categories of equipment under this new scheme in the US fall under two tax lives and two rates of investment credit. The system we recommend would be somewhat similar. Two tax depreciation rates only, 30 and 40 per cent, with investment allowance of 30 per cent. If the graduated rate is allowed, then possibly 30 to 35 per cent rates of investment allowance should be admissible. The policy-maker would have to identify the high technology areas to which 35 per cent allowance has to be given.

The real cost of capital and the effective tax rates that would prevail with our scheme, if implemented, are shown in Table 8.[5] The table shows that the effective tax rates and real cost of capital are well below the statutory rate for all categories of plant and machinery. For factory buildings and ships also, the rate is lower than under the present scheme. By extending investment, allowance eligibility to categories (f), (g) and (h), they are more insulated from the adverse effect of inflation. The tax system, under the proposed scheme, becomes more neutral which will have a salutory effect on resource allocation. Even between asset classes, the dispersion of effective tax rates is smaller because of the reduction in effective tax rates for factory buildings and ships. After all, these are an important part of infrastructural facilities and a lower effective tax rate is required to induce investment in them.

For the sake of comparison, the effective tax rate on different types of equipment and structure categories in the US are displayed in Table 9. The estimates are given both for old Asset Depreciation Range (ADR) scheme and the new Accelerated Cost Recovery Scheme (ACRS) implemented by the Reagan Administration. It is clear from Table 9 that the effective tax rates are negative for most categories or equipment. In other words, to stimulate capital formation, US tax payers subsidise the corporate units undertaking additional investment under the newly implemented ACRS. This could, in part, explain the reported lowering of average plant life in the US, especially in comparison with Japan.[6]

The results obtained from our study, and those available for the USA, further indicate that the effective tax rates on marginal investment are rather high for a country like India which is aiming at increasing its capital stock.

The foregoing results in India were based on an assumed inflation rate of 10 per cent. However, should the inflation rate accelerate in the future, the effective tax rates would increase. In that case, a further adjustment in the tax system would be essential to prevent gross capital formation from declining.

## Notes

1 Assets are assumed to experience geometric decay in the quantity of output. This assumption has been supported by empirical studies of depreciation in USA.

2 For details, see Gupta and Gupta (1985) Ch III.

3 For details, see Gupta and Gupta (1985) Ch III.

4 This is true whenever the pattern of investment demand for high inflation rates is compared with the pattern of investment demand for inflation rates near zero.

5 Tax holiday benefit is excluded in the estimation of all categories/classes to facilitate comparison and to assess the impact of depreciation and investment allowances. We have assumed that the entire 30 per cent investment allowance benefit is taken by the enterprise in the first year. However for new projects especially, the unavailed relief is likely to be high. If investment allowance is used up over say three years then the discounted value will be lower than if all of it is taken in the first year. These factors in fact tend to increase the real cost of capital and the effective tax rates.

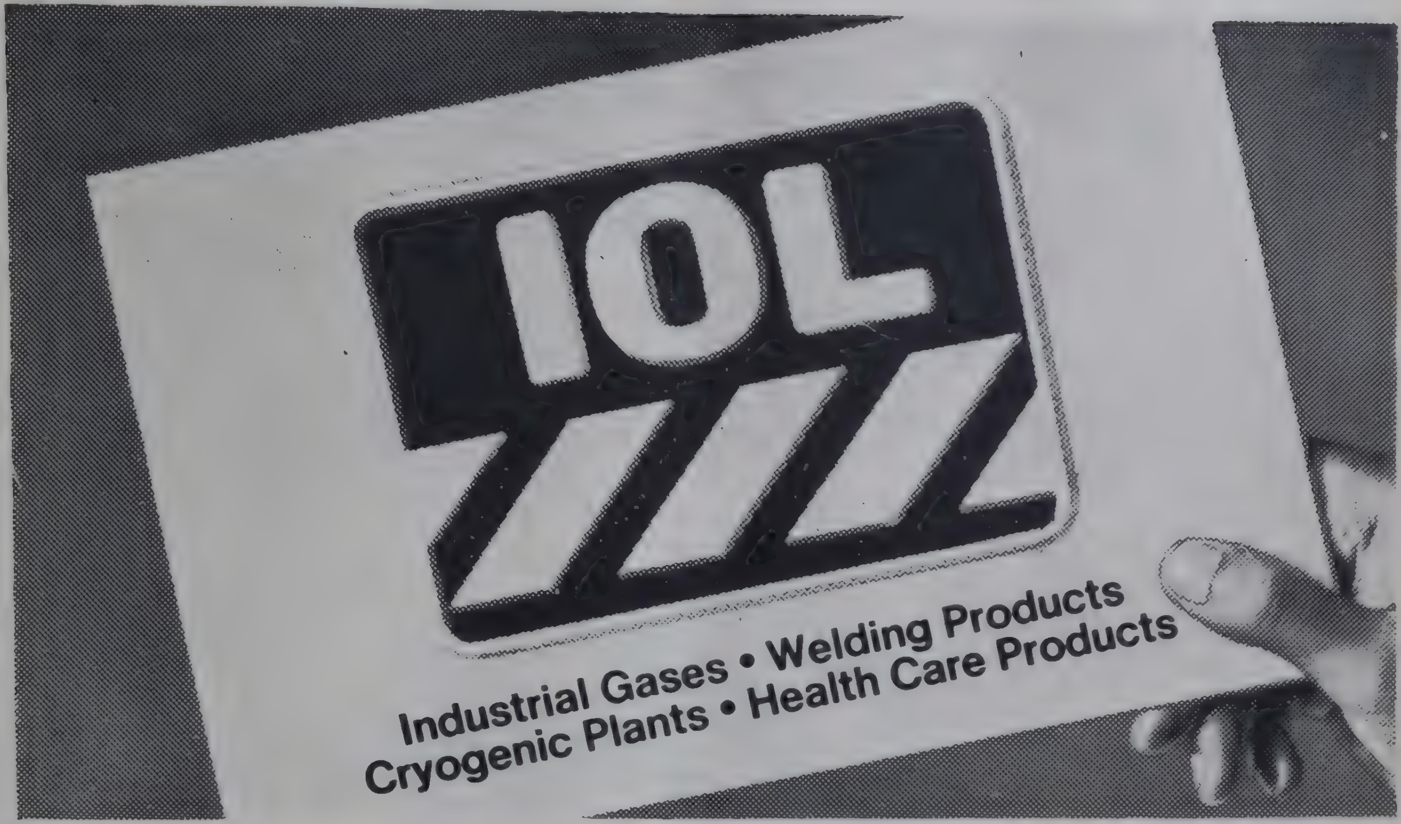
## IPCL

INDIAN PETROCHEMICALS CORPORATION (IPCL) has achieved a record production, sales and profits during 1984-85. The preliminary results indicate that sales turnover has increased by 23 per cent from Rs 472 crore in the previous year to approximately Rs 579 crore. Profit before depreciation, interest and tax is estimated at Rs 118 crore against Rs 84 crore and the gross internal resources generated will be of the order of Rs 103 crore against Rs 90 crore. Profit before tax is likely to be about Rs 60 crore as compared to Rs 36 crore. The contributions to the Central/state government exchequers by way of payment of excise duty, customs duty, sales tax, etc were approximately Rs 130 crore. Production of major saleable products in various plants during the year has been 25 per cent higher than last year. An all time record production was achieved in respect of low density polyethylene, polypropylene, polybutadiene rubber, benzene, acrylonitrile and several other products, despite constraints such as power shortage, tripouts, raw material problems etc.

During the year, IPCL commissioned India's largest size 55,000 tonnes per annum PVC plant, 5,000 tonnes per annum petroleum resins and 130 tonnes per hour boiler with micro processor in a record time. The safety performance of the Corporation continued to remain outstanding. It introduced several new products in the market including petroleum resins, ethylene dichloride vinyl chloride monomer, polypropylene stabilised powder, new generation solvents like hepton, purified solvent cix, ammonium sulphate. Another important achievement was the equitable distribution of the products primarily to the small scale sector. Sustained progress has been achieved in the implementation of major projects on hand at Vadodara at an estimated cost of Rs 245 crore. These projects include PP copolymer plant, bi-component acrylic fibre plant and expansion of the existing DMT and LAB plants. An important milestone of the year was the government's decision to entrust implementation of a gas cracker complex with a capital outlay of Rs 1,167 crore at Nagothane in Maharashtra. The complex will have a capacity to produce 80,000 tonnes of LDPE, 1,35,000 tonnes of LLDPE, 60,000 tonnes of polypropylene, 50,000 tonnes of ethylene glycol, 5,000 tonnes of ethylene oxide and 1,740 tonnes of acetylene black. Work on socially oriented projects to generate rural employment gathered momentum and achieve progress during the year. The activities on 'plasticulture' to extend applications of plastics in agriculture and water management gained considerable ground. Over 7,000 tonnes of LDPE film was used to line 1,000 kms of canals in the country to preserve water and to protect and store over 10 million tonnes of foodgrains.



IOL
Industrial Gases • Welding Products
Cryogenic Plants • Health Care Products

**When people in highly diverse fields look for "the IOL mark", what do you think it implies?**

**Simply that Indian Oxygen Limited (IOL) has acquired an enviable reputation for the quality of its products and service. In areas far beyond only oxygen.**

**Industrial gases : applications to spur development in vital industries**

IOL pioneered the manufacture of oxygen, nitrogen, argon and dissolved acetylene in India. Today IOL's gases have varied applications. From wayside welding to shipbuilding to INSAT, from transportation and telecommunication to power and mining. The Company not only manufactures these gases but is unique in providing technologies associated with their different applications. Further, IOL manufactures special gases which play a vital role in sophisticated industries and research.

**A new dimension to metal fabrication**

IOL offers a comprehensive range of welding equipment consumables and accessories for customers. All this, along with advisory services, comprises a total welding "package". IOL also offers cutting machines to suit every industry. From automobile manufacture to shipbuilding.

**Cryogenic technology for building infrastructure**

IOL's cryogenic plant and associated equipment manufacturing activity has helped build the infrastructure for planned development. The Company offers complete cryogenic plants, and engineering, distribution and handling systems on a turnkey basis. IOL was the first to manufacture and supply air separation units in India.

**Health care : a priority concern**

The Company continues to contribute to the medical profession with an assured supply of medical gases, anaesthetic equipment and equipment for lung functions. As well as centralised distribution systems through pipelines for medical gases and vacuum to medical establishments.

# Indo-Soviet Relations

EVEN considering the central position of Indo-Soviet relations in the Government of India's external policies, the Prime Minister's visit to the Soviet Union from May 21 to 26 has attracted an unusual amount of interest. There was first a great deal of speculation on whether or not the Prime Minister would symbolically reaffirm the primacy of India's relations with the Soviet Union by undertaking a visit to that country before going to the United States. That speculation having been set at rest, the details of Rajiv Gandhi's Soviet trip have been minutely scrutinised for signs of any change, however subtle or incipient, in Indo-Soviet relations. Another group of analysts have, on the other hand, been in a great hurry to see in the outcome of the Prime Minister's visit evidence of a further strengthening of the close relations between the two countries. They have gone so far as to even assert that the prospects for Indo-Soviet ties opened up by Rajiv Gandhi's visit mark a reversal of the 'cooling off' which they now allege had taken place in the later years of Indira Gandhi's rule.

The reason for this unusual interest in the Prime Minister's Soviet visit is undoubtedly the developments in India's relations with the West, and with the United States in particular. In the first place, whereas the Soviet Union has been the dominant source of supply of sophisticated armaments to this country, in the last few years the Indian government has made large and much publicised arms purchases from Britain, France and West Germany. It had also entered into negotiations for an arms deal with the US. Though these negotiations did not then fructify, they are almost certain to be resumed now after the Prime Minister's forthcoming visit to the US. Secondly, and more importantly, Rajiv Gandhi and his government have made no secret of the need for advanced industrial technology from the West for the success of their plans for modernising the Indian economy, raising industrial efficiency and productivity, and so on. Towards this end policies governing import of technology and capital goods into the country have been relaxed and the Prime Minister as well as other members of the government have on a number of occasions (such as the European Management Foundation meeting in New Delhi in April) publicly wooed businessmen from West Europe, Japan and the US. This process of strengthening of economic relations with the West, it is apparently felt, is likely to have its repercussions on India's ties with the Soviet Union.

The joint statement issued at the end of the Prime Minister's visit as well as the available reports on the visit do not, however, indicate any shifts in Indo-Soviet relations, in one direction or the other. It has been mentioned that the part in the joint statement dealing with the situation in Afghanistan is virtually a verbatim repetition of what had been said in the statement issued at the end of Indira Gandhi's visit to the Soviet Union in 1982. The same could be said about very many other parts of the joint statement, in terms of their content if not the precise words used. On the other hand, while it is true that the rouble 1,000 million credit, the agreement for which was signed by Rajiv Gandhi and Mikhail Gorbachev, is the largest such credit offered to India by the Soviet Union, its utilisation will be spread over many years. The pace of utilisation of past Soviet credits has been affected by factors internal to the Indian economy, such as the availability of rupee resources for financing the indigenous component of the concerned projects. These factors will continue to affect the use of the latest Soviet credit. Even if it is assumed optimistically that the credit will be substantially used up in the Seventh Plan, it will clearly constitute only a small part of the total assistance from external sources likely to be required over the five-year period. Further, neither the agreement for the large rouble credit nor the other more general agreement, also signed by Rajiv Gandhi and Gorbachev, on the long-term framework of economic, trade, scientific and technical co-operation between the two countries, provides an answer to the major problem of Indo-Soviet economic relations—that of diversifying India's imports from the Soviet Union beyond petroleum and petroleum products or, more precisely, increasing Indian imports of industrial machinery and equipment from the Soviet Union.

It is thus as fruitless to search for signs of any adverse change in Indo-Soviet relations as for those of a fresh breakthrough during Rajiv Gandhi's visit to the Soviet Union. This is not very surprising. For it is not necessary to assume that the establishment of closer economic links with the West through increasing reliance on capital goods and technology provided by the multinationals, or even the larger armaments purchases from the West, will affect Indo-Soviet relations. The western suppliers of equipment and technology as well as the arms vendors are straining at the leash to gain access to India's lucrative market of very sizeable proportions. The western business and financial press is all agog over the scramble among the multinationals to get into what is described as this market of 100 million, referring to the top 10-15 per cent of India's population with the purchasing power to spend on the goods and services they can directly or indirectly provide. So the Government of India need not feel called upon to offer a *quid pro quo* in the form of any modulation of its policies towards the Soviet Union. Indo-Soviet relations, on the other hand, are based on a different set of factors—among others, the United States' support for Pakistan as part of its geo-political strategy for this part of the world, the Soviet Union's reliance on India to counter that strategy and India's need for Soviet support to sustain its aspiration to be a dominant power in the region. So long as these factors remain constant, Indo-Soviet relations need not change. Of course, a pattern of accelerated capitalist development, based on close economic relations with the West, should be expected in course of time to influence the government's foreign policy perceptions. But even that need not jeopardise Indo-Soviet relations. Does not the joint statement issued after Rajiv Gandhi's visit declare once again that "relations between India and the USSR demonstrate the fruitful character of ties between states with different socio-economic systems"? It should not matter if the difference between the socio-economic systems gets a little more pronounced.

## *State Finances*

### A Dose of 'Discipline'

THE Centre has decided to play the stern school master to the state governments in respect of the latter's overdrafts from the Reserve Bank. In the past the Centre has advanced special loans to the states to enable them to wipe off their overdrafts. It is apparently decided not do this any more. Instead, it is insisting that the state governments bring down their outstanding overdrafts gradually over the next four years in such a manner that the slate is wiped clean by the beginning of the last year of the Seventh Plan.

The outstanding overdrafts of the state governments was Rs 1,808 crore on January 28, according to the Finance Ministry. This figure is to be brought down by 10 per cent in 1985-86 so that at the end of the year the states' outstanding overdraft will be Rs 1,628 crore. The required reduction in the overdraft will be much steeper in the next two years, 35 per cent in each year, and the remaining 20 per cent is to be wiped off in 1988-89. In other words, the state governments will have to set apart Rs 181 crore in the current year towards bringing down their overdraft, Rs 633 crore in each of the next two years and Rs 362 crore in 1988-89.

It is interesting that the Centre could not be persuaded to write off the states' overdraft in the old manner by extending special loans to them even though we are at the start of a new Five-Year Plan and the outstanding overdraft is a carryover from the previous Plan. The Finance Ministry has argued that its scheme for wiping off the carried-over overdraft of the states will not affect the states' Seventh Plan since the Planning Commission had apparently taken this into account while assessing the resources likely to be available for financing the Seventh Plans of the different states and had fixed the size of their Plants on that basis. This may be so, but that is not to say that the states' Plans have not been affected.

The total size of the states' Seventh Plan is not yet known, though the Planning Commission has completed its round of discussions with the state governments. It is certain, however, that the states' share of the total public sector outlay under the Seventh Plan will show a decline compared that under the Sixth Plan. The Planning Commission clearly had no choice in the matter; it simply followed the directions given to it by the Centre. This procedure of preparing the Plan also exposes the irrelevance of the National Development Council which is notionally the final authority to approve the Five-Year Plans. When the NDC meets later this year it will be presented with the *fait accompli* of a sharp cut in the relative share of the total public sector outlay in the Seventh Plan going to programmes of the state governments.

The reduced outlay on the states' Plan is particularly ironical in one respect. Stocks of foodgrains with the Central government, or rather the Food Corporation of India, have mounted to the point where large quantities of the indifferently stored grains are in danger of being damaged. The circumstances are thus very propitious for substantially expanding the rural employment programmes which are implemented by the state governments. The Centre should have been prepared to give special loans for this purpose to the state governments even if this meant an increase in the Centre's budgetary deficit by as much as Rs 1,000 crore or even more. That would have been one way of partially resolving the cruel paradox of large food stocks on the one hand and millions of half-starving poor people on the other. However, because of the resource stringency facing the state governments the employment programmes are likely to be actually scaled down.

### Of Soldiers and Small Pox

*Vimal Balasubrahmanyan writes:*

THE World Health Organisation (WHO) has been at considerable pains in recent times to assure the world that small pox eradication is total, that 'suspected' cases on investigation have invariably proved to be false alarms, and that vaccination against this dreaded disease is really not needed any more. At present, Albania is the only WHO member state which still continues an official policy of routine vaccination for its people. No country today requires a small pox vaccination certificate from international travellers. 'Suspected' cases continue to be reported at the rate of about 20 per year. So far all have proved to be false.

What the WHO has not exactly been advertising is the fact that the major military powers continue to require vaccination for their armed forces. The only conceivable reason for such a policy is that soldiers need protection from the possible use of small pox virus for biological warfare. It does not, however, answer the question: what about the civilians who are equally vulnerable?

In May this year, the media highlighted the fact that the world continues to be free of small pox. The last reported case in India was ten years ago in May 1975, while the last case in the world occurred in Somalia in 1977. On May 8, 1980, the 33rd World Health Assembly declared that small pox had been eradicated, and in the past five years much effort has gone into persuading national governments to stop vaccination as an official policy. While people at large are being reassured that small pox cannot reappear in the *natural* course of events, there is hardly any public awareness regarding the possibility of an engineered and *man-made* reappearance of the disease.

According to a snippet in the June 1983 issue of the WHO journal, *World Health*, the policy to discontinue vaccination does not apply to military personnel in the USA, who are vaccinated at the time of joining and every five years thereafter. The journal reports: "WHO is seeking to determine just what the policy of the armed forces is throughout the world. What is at present known is that vaccination is not required on joining up in five countries: Denmark, Finland, Netherlands, Switzerland and UK." Commenting on this information the *New Internationalist* (March 1984) adds that Norway has joined the list for a trial period of only three years. However, in asking why the health of soldiers is more important than the health of the civilian population, the *NI* is perhaps missing the point. The immunisation is not part of a routine preventive health practice but is specifically aimed at conferring protection against any possible military use of the virus.

Last year, in a lengthy article on small pox in *Science Today* (March 1984), a senior virologist from an ICMR unit mentioned in passing this possibility of small pox virus being used as a weapon, and wrote: "This would be the act of a devil and let us hope this does not take place." However, nothing being unfair in war and no deed too diabolic, it is not surprising that both USA and USSR continue to vaccinate their military forces.

*World Health* (November 1984) reports that at present only two laboratories in the world retain small pox virus, under maximum security, for scientific purposes. These are the US Centre for Disease Control in Atlanta, Georgia, and the Research Institute of Viral Preparations, Moscow. As a standby for an unforeseen contingency, 300 million doses of the preventive vaccine are being stored in Geneva. It is also reported (*World Health*, November 1983) that Wyeth Laboratories, the sole US producer of the vaccine, has taken it off the commercial market, though the firm continues to supply the vaccine to the US armed forces.

To the question 'can small pox reappear?', WHO says that although the laboratory stocks of virus constitute a possible threat, these are guarded with so much security that the risk is virtually ruled out. As for the possibility of a 'deliberate release', the WHO document "The Global Eradication of Small Pox" (1980) points out that many nations of the world signed in 1972 a convention outlawing the use of biological weapons in warfare. However, it adds: "Nevertheless, abhorrent as such an act would be, the possibility of variola (i e, small pox) virus being deliberately released as an act of sabotage or terrorism cannot be excluded. The potential harm of such an act would increase as the immunity of the population waned: in addition to illness and death there would be psychological and possible socio-economic damage." Obviously, as long as stocks of the virus are preserved, soldiers will continue to be vaccinated.

## *United States*

### Reagan's Tax Reform

RONALD REAGAN has launched what he calls the 'Second Revolution' with his tax reform package. Supply side economists—those who believe that with the burden of taxation reduced, production will so accelerate that the government would be able to collect a lot more in revenue than what it would lose as a result of the lowering of the tax rates—might be tempted to regard this as their dream come true. They would not be entirely right, though.

Basically what the Reagan tax reform package proposes to do is to drastically reduce the highest marginal rate of tax on both personal and corporate incomes and make up for the lost revenue by withdrawing various exemptions, deductions and allowances. That is really how the revenue neutrality of the package is achieved, not by the magic of supply side economics. So if Ronald Reagan's commitment to supply side economics were to be judged by the way he has sought to secure revenue neutrality, he would flunk the test. India's Viswanath Pratap Singh would fare much better because his Budget lays far greater store by that magic—regardless of what India's own experience with tax rate reductions in the past demonstrates.

Coming to the details of Reagan's proposals, for individuals the tax breaks are many-sided and all-embracing, though, as we shall see presently, the major beneficiaries are those in the higher income brackets. In 1981 the marginal rate of income tax was brought down by Reagan from 70 per cent to 50 per cent; now he proposes to reduce it further to 35 per cent. In place of more than a dozen tax brackets, hereafter there will be only three brackets: below $ 20,000, $ 20-70,000 and over $ 70,000 with applicable rates of 15, 25 and 35 per cent, respectively. The exemption limit will rise from the present $ 1,040 to $ 2,000 per person and it will be adjusted for inflation, as under the present law. The standard deduction for the single tax-payer goes up from $ 2,480 to $ 2,900, for single heads of households from $ 2,480 to $ 3,600 and for joint returns from $ 3,670 to $ 4,000. A household with husband, wife and two children, it has been calculated, will be altogether exempt from income tax if its income is below $ 12,000 a year.

Among those who fall in the tax net, what will make for differences is not just the reduction in rates and the restructuring of tax brackets, but also what is proposed with regard to various allowances and deductions. Two major disallowances proposed in the Reagan package relate to (1) state and local taxes, and (2) interest payments. While the deduction currently allowed for state and local taxes will be withdrawn, that for interest payment has been curtailed; whereas interest paid on mortgage for a principal residence will still be deductible in full, other interest deduction will be limited to $ 5,000 plus an amount equal to the individual's 'passive investment earnings' such as interest, dividends and earnings from limited partnerships. Thus the higher one's passive investment earnings, the greater the interest deduction one can claim.

Another major proposal in the Reagan package, it should be added here, is to reduce the top capital gains rate from the current 20 per cent to 17.5 per cent for stocks and shares and other non-depreciable assets. Depreciable assets would, however, be taxable at ordinary income tax rates, but after adjustment for inflation.

While the biggest gainers from the tax proposals relating to individuals will be those with very high incomes, say, ex-

All remittances to **Economic and Political Weekly**.

ceeding $ 200,000, Reagan has evidently taken care to see that those at the lower end of the income scale are not completely overlooked—just as Viswanath Pratap Singh has done. (Not for nothing has the Indian Budget for 1985-86 earned Rajiv Gandhi the name Rajiv Reagan from *The Wall Street Journal*, possibly the most conservative of the American dailies.)

But this is not the end of the story of the Reagan package. On corporate incomes, the basic rate will come down from the current 46 per cent to 33 per cent, with lower rates for small businesses. The new effective rate will be even lower than 33 per cent since the package permits corporations to deduct 10 per cent of the dividends distributed. Thus for a firm distributing 50 per cent of its current profits as dividends, the tax on total profits would work out to 31.35 per cent.

In return for the lower tax rate, corporations not only forefeit the investment tax credit which is currently available at the rate of 10 per cent of qualifying investments but will also be entitled to less generous write-offs by way of depreciation deduction. Also, although the Reagan package still retains many of the generous tax breaks allowed to the oil and gas industry by current law in the form of same year write-off of intangible drilling costs and generous depletion allowances, other industries are not let off so lightly. Thus the package does away with the special deduction which financial institutions enjoy with regard to bad debts. In fact, according to the US Treasury's calculations, the effective tax burden on corporations, taken as a whole, would go up by 23 per cent in 1990 whereas for individuals it would come down by 5.2 per cent.

Not to be forgotten is the provision of the Reagan package for a minimum tax of 20 per cent on corporate income. There has been a strong demand for a minimum tax in the Congress and outside in view of the growing evidence that several big companies end up year after year paying virtually no tax on their profits.

The tax reform package that Ronald Reagan has unfolded makes quite a few departures from the proposals that his Treasury Secretary had put out some months back. The latter would have treated capital gains as income and taxed them accordingly, once adjustment was made for inflation. Also the Treasury plan was to withdraw altogether the special deductions enjoyed by the oil and gas industry. Clearly, Reagan felt impelled to make several concessions to the lobbies that could prevail with him.

Interestingly, state and local governments are the one group that could not make much headway with Reagan. This is precisely the group that he had vowed to strengthen as a sort of countervailing power against 'big government' in Washington. With deduction for state and local taxes repealed, not only will the combined burden of federal, state and local taxes go up, especially on individuals, the scope for state and local governments to raise additional taxes will be effectively curbed. As a result, they might well become more dependent on the federal government for additional resource transfers. But it does not appear that the state and local governments have a strong enough lobby in Washington, not even in the Congress.

## BUSINESS

# Wide Swings in Cotton Prices Continue

THE emerging cotton scenario has once again brought into sharp focus the imperative need for overcoming the gross inadequacies in the crop information system. The current season has less than three months more to go but still there is no consensus even on the size of the opening stock let alone the size of 1984-85 crop. Estimates mooted at the last (third) meeting of the Cotton Advisory Board held on May 10 varied between 87.25 lakh bales and 97 lakh bales. The Indian Cotton Mills' Federation placed the crop at 87.25 lakh bales but it did not show much reluctance in accepting the figure of 90 lakh bales mentioned by the CAB subcommittee. The Cotton Development Council estimated the crop at 91/92 lakh bales. The trade placed the crop at no less than 97 lakh bales.

The estimate put up by the East India Cotton Association which represents the trade is said to be based on "actual physical count of crop ginned and pressed at the factories at all cotton centres" through its upcountry member associations. EICA claims to have taken adequate care to check the weight of bales to get the "running bales converted into standard bales of 170 kg each". Since over 90 per cent of the crop has already been marketed, estimates based on ginning and pressing figures should be considered more reliable than others.

A very significant aspect of the crop estimates mooted at the CAB meetings is the progressive upward revision of these estimates. At its first meeting on October 1, the Cotton Advisory Board estimated the crop at 79.80 lakh bales and the season's opening stock at 12.29 lakh bales. These estimates were revised to 84.75 lakh bales and 16 lakh bales when the Board met for the second time on February 2. The estimate put up at the third meeting on May 10 shows an increase of at least 10 lakh bales over the first forecast which must have assumed normal weather conditions. EICA has always reckoned the season's opening stock at 21 lakh bales.

Because of the impact of unpredictable weather conditions till the harvest time, revision of crop estimates is quite common all over the world. Vagaries of the weather apart, crop estimates in India suffer seriously from organisational deficiencies in collecting requisite information in respect of sowings and the progress of the crop till the harvest is ready. Wide differences in the cotton crop estimates put up by the representatives of growers, trade and industry reflect in no small measure their conflicting interests. Official estimates of cotton are known to command little credibility. It is indeed amazing that the government should never have realised the absurdity of the industry having consumed over the years more cotton than has been available (production as officially estimated plus imports minus exports and extra factory consumption).

The cotton market scene provides an interesting study not only in regard to crop estimates but also in respect of wide swings in prices. No less notable are the apparently contradictory demands for liberal exports by the farm lobby and for imports by the cotton mill industry, reflecting partly the over-abundance of long and extra long staple cotton in relation to the availability of short and medium staple cotton. The farm lobby is interested in export of long and extra long staple cotton because of the higher prices this cotton can fetch abroad. Besides, exports help reduce the pressure on domestic supply thereby imparting steadiness to the market. The export quota for two lakh bales issued in two instalments has been fully utilised and the Maharashtra State Co-operative Cotton Growers' Federation which is operating the state monopoly procurement scheme and is still holding a large stock of long staple cotton has been pleading for the release of another three lakh bales for export.

That the Indian Cotton Mills' Federation should have continued to plead for import of five lakh bales of short and medium staple cotton despite the upward revision of crop estimates gives one the impression that the move is intended mainly to influence the course of prices. The CCI chief has dismissed the ICMF's apprehensions of cotton shortage as baseless. The managing director of the Maharashtra State Co-operative Cotton Growers' Federation, B K Agarwal, has stated that the Federation is holding sufficient stocks of short and medium staple cotton and that none of the ICMF members came forward to lift this cotton when it offered this cotton at the lowest possible prices in May.

The overall behaviour of cotton prices clearly indicates that the supply position is distinctly comfortable. Prices have been inclined lower despite record mill consumption averaging over seven lakh bales a month. After registering a steep decline from the November/December high levels, cotton prices recorded quite an impressive recovery during March and mid-April but thereafter they again started drifting lower. Prices have come down by Rs 250 to Rs 500 a candy since about the middle of April. In view of the comfortable supply position, prospects of any major recovery in cotton prices are generally rated low.

Under the new textile policy which is to be announced any day now, curbs on expansion and creation of new capacity by the mills are expected to be removed, full flexibility allowed in the use of fibres and fiscal levies on man-made fibres and yarns progressively reduced. Much would depend on how the policy is implemented as also on the demand for fabrics. There need be little doubt that the textile industry has the capacity to use all the cotton and man-made fibres the country can produce in the foreseeable future.

## *Industry*

### Bogus Members and Rigged Elections

THE trouble in the Federation of Indian Chambers of Commerce and Industry has the flavour of byzantine intrigue, and not surprisingly so considering that the personalities involved are amongst the most powerful in trade and industry in the country.

The Federation's 58th Annual General Meeting concluded in New Delhi on May 20 without seeming to be particularly bothered about the previous week's decision of the Indian Merchants Chamber to quit the apex body. The Bombay-based IMC, representing industry and trade interests in western India, was upset over enrolment of bogus members and lack of consensus in FICCI's decision-making process.

The issue of bogus membership in FICCI was reportedly first raised in 1981. Little is known of the findings and impact of the committee then set up to probe this charge. D N Patodia, the President of FICCI for 1985-86, categorically denied the existence of any bogus members. But Ramakrishna Bajaj, the outgoing President, virtually admitted their presence when he spoke to the meeting of the need to discard undignified members. There is in a way incontrovertible evidence too; 200 letters said to have been posted by the IMC to the addresses of FICCI members were returned by the postal department as the concerned parties could not be traced.

Membership of the FICCI's Committees essentially means regular and easy contact with ministers and officials which the members are known to use to pursue their own interests. Also the Committees formulate proposals placed before the government on behalf of FICCI. And since the Committees are elected by constituents of the Federation, the issue of the bogus membership assumes importance.

FICCI has been dominated by the big Marwari houses of North and East India, particularly the Birlas. This seems to have become an irritant to the Gujarati interests based in the West, represented by the IMC. This interpretation of FICCI's troubles as arising out of a Gujarati-versus-Marwari conflict should not be extended too far.

For the past three years or so the IMC members have sought to assert themselves in the FICCI through the elections at the Annual Meeting. But they have been outmanoeuvred by the Marwari group which reportedly relies on the bogus members it has enrolled and that too mostly from South India. During the 1984-85 poll, the tension between the two contesting groups mounted to a level reportedly necessitating police presence. The IMC candidates in this week's elections withdrew their candidature, even prior to the Chamber's formal decision to quit FICCI. Consequently, the election to the various FICCI Committees and posts were unanimous. The functioning of the IMC itself is probably not very different. Critical members of the Chamber accuse it of also disregarding consensus while arriving at decisions.

Interestingly the post of vice-president for 1985-86 and therefore next year's president, ought to have gone to a representative from South India, according to the convention of rotation followed so far. But R P Goenka was elected vice-president after agitated members from the South were persuaded to give up their claim this year. Goenka's election to the post was said to be necessary because of the holding of a meeting of the International Chamber of Commerce in New Delhi in 1986-87. This episode clearly indicates the desire of the North and East-based Marwari houses to continue controlling the FICCI.

Even as some FICCI seniors are said to be engineering dissension within the IMC, the Federation has designated a committee to try and win back the IMC. Whether the IMC will return or stick out on its own, like say the Tata group has done for quite some time now, remains to be seen.

## *Art Silk Industry*

### Showing the Finance Ministry Its Place

THE violent mob attacks on the investigating Central Excise team in Surat this week virtually confirmed that the art silk industry located there has been evading payment of excise duty on a massive scale.

The assault, in which seven excise personnel were seriously injured, was evidently pre-planned. The over 400 strong search party, sent by the Union Finance Ministry to the South Gujarat city reportedly following complaints of duty evasion received by the Prime Minister's Secretariat, worked unhampered on the morning of May 24. The concerned mills and traders whose unaccounted stocks, record books and other incriminating evidence was seized, appear to have mobilised the armed gangs which attacked the excise team later that very day. This inference, though obvious in a sense, is substantiated by the fact that the attackers were keen on snatching back and destroying the seized evidence, which they largely succeeded in doing.

Those master-minding the assault seemed to be pretty desperate in taking the extreme step of physically mauling officials and obliterating proof of their financial malpractices. At the same time, they were apparently not in the least afraid of being hauled up before a criminal court. Probably this was partly because the mill owners and traders realised that they could easily avoid being convicted as the actual attackers were said to be hirelings and since the episode occurred at a time when parts of the city were under curfew in the wake of the anti-reservation riots. More importantly though, the city administration, and possibly the Gujarat government too, seemed to be tacitly backing the erring mills and traders. The Union officials leading the excise team plainly admitted to the press that the Surat police offered no help or protection despite repeated requests. Also the Union Finance Ministry did not seem to have much faith in the Gujarat government on this issue, given that the latter was not informed in advance of the raid, as is the normal practice.

Union Finance Minister V P Singh has said that serious action would be taken against those responsible for the violent acts. How effectively this threat will be carried out remains to be seen. But for the present it is strange that the searches were discontinued following the physical assault. Fabrics worth only Rs 2.53 crore were said to have been seized when the concerned officials themselves have noted that the duty evasion was colossal; the extent of excise evasion each year by the silk industry in Surat is estimated to run into hundreds of crores. At the very least a fresh, more determined, search ought to have been carried out and stringent action initiated immediately against the offenders. Since this was not done, persons in other trades and industries might derive 'inspiration' from the Surat silk industry to not only evade payment to the treasury but also to try and escape unscathed when a search is carried out on them. The fear instilled by the incident in the excise and other similar personnel in carrying out their tasks is another matter altogether.

## LETTERS TO EDITOR

# Drug Policy

PERMIT me to correct/clarify a couple of points made in your editorial note "Drug Policy in Limbo" (*EPW*, May 4).

It is true that clause 21 of the drug policy 1978 requires that foreign companies producing formulations from imported bulk drugs or bulk drugs from imported intermediates should manufacture the bulk drug from basic stages within two years. This provision, like several others, has only been partially implemented because it cannot be rigidly enforced without regard to the economic and technological feasibility of bulk drugs manufacture. The critical factors are: (1) the demand for the drug should be large enough to warrant basic manufacture, (2) the technology must be available, and (3) raw materials must be available at reasonable prices.

There are about 500 bulk drugs used in the manufacture of formulations—tablets, capsules, liquids, injections, etc—in India but the number of bulk drugs produced in the country is less than half of this, 225, according to official statistics. It is obviously unrealistic to insist that each and every new drug should be manufactured in the country in bulk form within two years of its introduction. The government has, therefore, rightly allowed the manufacturers to continue to import the bulk drug on merits. The alternative would be to import the formulation or the bulk drug itself if import of intermediates is not allowed.

The economics of drug manufacture is such that for every drug there is a minimum economic scale or size below which it is uneconomic to manufacture it. The demand for several bulk drugs in our country is so low that it is not economically feasible to produce them in bulk from the basic stages. Even the Working Group on Industrial Approvals of the National Drugs and Pharmaceuticals Development Council (NDPDC) recognised this and recommended that the down-phasing of basic manufacture should be decided on a case-by-case basis; in other words, on the merits of each case. It also recommended that if intermediates are available indigenously, production from basic stages need not be insisted upon.

As regards new drugs, you will appreciate that what is important is not so much who or which company introduced them in the market. There are several constraints on the introduction of new drugs by international companies. But that is a separate issue. The important point is whether new drugs after introduction are manufactured in India in bulk from basic stages. Producing formulations (i e, in dosage forms such as tablets, capsules and injections) from imported bulk drugs does not normally involve any sophisticated technology; it could be done by any reasonably well-equipped and well-staffed small scale unit having a good quality control culture. The true measure of the industry's capability is its competence to manufacture high technology bulk drugs and not its ability to punch tablets and fill capsules.

Contrary to what you say OPPI is not indifferent to the price question. But it believes that, in the long run, prices can be brought down not by a clumsy price control mechanism but through proper production/supply management to ensure that there is an abundant supply of essential drugs. For this we should encourage more production, greater economies of scale and stimulate competition by delicensing and removing control on prices. Over-protection and over-regulation have only produced an anaemic, high-cost industry.

Our experience of nearly a quarter century of control on pricing and production of drugs shows that this prescription has not benefited either the consumer or the industry. Let's think of a new line of treatment for a change.

ARVIND NAIR

Communications Manager,
Organisation of Pharmaceutical
Producers of India, Bombay.

### Out-Rowlatting Rowlatt

THE Terrorist Disruptive Activities (Prevention) Act is the last nail in the coffin of the fake Indian democracy. Anyone who opposes the dictates of the state becomes a terrorist and, by implication, those who toe its line, however illegal and inhuman, would be deemed law-abiding citizens. Questioning the sovereignty of the state is a very vague expression that can be interpreted to include any criticism of, and opposition to, the state. 'Territorial Integrity' is another vague expression. Those who fight for greater rights for the states and of the various nationalities in the country can now be dubbed as indulging in 'disruptive activities'. The worst of it is that one does not have to actually indulge in such activities at all. Even if one preaches them by song, poem, photo, picture, dance, etc, he is liable to become a criminal. This is a frontal assault on artistic and intellectual freedom and freedom of expression.

This Act is worse than the Rowlatt Act and its draconian nature is self-evident. It is a shame that even the CPI and CPI(M) did not oppose it, though they have been clamouring for state rights in Kerala and West Bengal. The fascist nature of the Telugu Desam government is coming out more into the open and its eager welcome for the Act and its contention that the state government should be free in its implementation is one of the portents of White Terror. The AILRC condemns this Act in the strongest possible terms and calls for its scrapping. It calls upon the people to take up the beastly challenge and to fight back to restore democracy, which can only be People's Democracy.

K V R

General Secretary, AILRC,
Kavali.

C.F.T.R.I. [illegible]

# The Making of a Lawless Society

### Romesh Thapar

WHEN the persons arrested for being involved in the transistor-bomb attacks were produced in a Delhi court, no newspaper had the integrity to comment on their poor physical condition. When one of the leading accused died in hospital, we were told that it was the result of injuries sustained when struggling against the police. The doctor's report was the most unsatisfactory document I have read in a long while. And, now, it appears that another of the accused is in bad shape.

In this Capital, we receive a regular quantum of stories about police torture of terrorists and suspected terrorists. They are believed, because public memory is still stored with accounts of what transpired during the Emergency. And there is the private guilt of so many who allow their servants to be beaten up in the local police station or who treat torture atrocities as if they were of little concern to them personally.

It isn't only the police who misuse their power or behave brutishly. The record of the armed forces is also punctuated with atrocity incidents or misbehaviour of a kind that should not be tolerated by a civilised society. The record covers a rather large canvas from Nagaland to Punjab. The military authorities still possess the discipline to punish. The police only protect themselves and, sometimes, as in Ahmedabad, take the battered and mutilated law into their own hands.

I always wonder at the surprise that is expressed when the public is assaulted by the uniformed services. The pattern, after all, is familiar in every mohalla. The exception is the news which records the talk of the bazaars—that so many of the rapscallions caught indulging in violent and disruptive acts were once the activists of the ruling party and the ruling politicians. The Press Council chairman, a former Judge of the Supreme Court, should know better than to attack an already subservient press.

Indeed, the question is asked, but not published, who released from jail the younger brother of Bhindranwale four hours before he was asked to become the secretary of the extremist committee attempting to take control of the Akali Dal: And were transport facilities arranged for him? The Union Home Minister should be specific when pontificating on the media's alarmist reports.

It is most necessary for the media to highlight these matters, whatever the gaping loopholes in its democratic logic, because the new parliamentary enactment against terrorism and disruption passes, as Judge Tarkunde of the People's Union of Civil Liberties, says, draconian power into the hands of government and its agencies. Such powers have been legislated by voice voting in Parliament, and with the support of a confused and listless Opposition. It is about time that concern be felt beyond the Sikh community.

The Terrorist and Disruptive Activities (Prevention) Act of 1985, an addition to the mass of repressive legislation already in force in many areas of the sub-continent, is so broad in its sweep that past experience teaches that it will be used against political dissent, even against writing that becomes destructive of the reputations of those who govern. Such misuse of power is certainly the rule. A cursory examination of the record of those who administer the Foreign Exchange Regulation Act (FERA) and related COFEPOSA laws, which were originally designed to curb the activities of our smuggler kings, will show how many fearful harassments are the order of the day—yes, even as the smuggler kings rule the roost and finance political formations. How else can we interpret the record of the GOI?

It is the height of naivette to imagine that these extraordinary powers, which should shame any democratic society, will be exercised with skill and sensitivity. We do not seem to have imbibed the minimum meaning of these words, and judging from the way in which the Home Minister criticises his police establishment for grabbing publicity, or the police factions battle among themselves in Delhi and elsewhere, and the patterns of arrest, torture and harassment that continue to prevail, the prospects for democratic functioning are most disturbing. This amalgam of anti-terrorist actions could lead to more terrorism.

We have got into the terrible habit of treating our own people as enemies linked to what babu English calls 'the foreign hand'. As enlightened rulers, we never try to see the situation through the eyes of those whom we are attempting to tame. We had better realise that there is deadly explosiveness in this style of rulership. It has to change, and fast. All the flattering plaudits that Rajiv Gandhi may gather on his foreign tours cannot dissolve these dangers.

Even as I read the text of the latest enactment, a somewhat terrifying experience if you see yourself as a vengeful police or paramilitary commander on a rampage against some section of the people, I ask myself what will happen to so many young men, misguided maybe, who are leading struggles to defend the down-trodden. We hear of 'encounters' and are given to understand that they amount to organised killings. Has anyone in the system tried to find out, or are we content to kill for 'democracy'?

And how long will the wandering mind of official Delhi take to see the terrorism of the Congress(I) gangster politicians in the Indo-Gangetic heartlands of northern India. District upon district in Bihar and neighbouring Uttar Pradesh is in the grip of these political marauders. The writ of the state often does not run in these parts of our sub-continent. And, believe it or not, Delhi Congressmen are already complaining that the new police system is 'uncooperative'.

We seem to be living in some dreamworld imagining that terrorism is a phenomenon confined to the Sikh communities. The politics of violence are taking over wherever governance breaks down or refuses to manage with justice and impartiality. And this is becoming a feature of our life, despite the illiterate comments of visiting foreigners which we are happy to project with all the energy at our command.

And while we are busy explaining away our latent authoritarianism—which, incidentally, is no answer to the terrorism we face—we had better practise some of our principles in Tamil Nadu. The Sri Lankan civil war is the result of many failures, but let us not run away with the notion that the guerilla squads gathering (and, it is said, training) in that state are beyond the scope of the new Act. An interesting double-think!

There are too many persons in government and politics who believe that concentrated power is all that is needed to control situations. This psychological state creates the sanctions for a lawless society. The fact of the matter is that such power has rested with the GOI for decades, and yet the breakdown of governance becomes increasingly visible from year to year. More power, more breakdown. So it goes.

The anxieties of today are rooted in our fears about the calibre of the persons who pretend to rulership all over the sub-continent—the lumpenised, the criminalised and the communalised. They know next to nothing about the past, and cannot possibly project themselves into the future. It's a very special crisis calling for qualitatively different alignments, and these are not taking place as rapidly as they should.

Here are some maxims which need to be drilled into the heads of those who rule us, and very stupidly:

- An indiscriminate use of uncontrolled power strengthens precisely those elements who are sought to be destroyed.
- The forces called upon to exercise these powers are so brutalised and criminalised that the worst distortions take place on the plea of establishing 'law and order'.
- The continuing accumulation of power by the various arms of an ineffective government system on the plea of crisis management only intensifies the political breakdown.

Where can we begin to halt the corruption of power, before total power corrupts us totally?

*Footnote:* Apparently, judging from the tame amendments to the Arms Act, it is the considered view of the GOI that a surrender of private 'armouries' would worsen the law-and-order situation!

*May 24.*

# The Terrorist Act

### A G Noorani

THE Terrorist and Disruptive Activities (Prevention) Act, 1985 is a wholly unnecessary and menacing piece of legislation and is a precursor to a perhaps even worse legislation. For, on May 18, Union Home Minister S B Chavan said that a new bill on sedition was in the offing. It will be a grave threat to the freedom of the press and, indeed, to the freedom of speech generally. One hopes the opposition will be more vigilant then than it was on the Terrorist Act. The Supreme Court sustained the existing law of sedition embodied in section 124A of the Penal Code only by giving it a restricted meaning. Nothing has happened to suggest that sedition has so grown as to reveal the law to be inadequate. On the contrary, the existing laws against secessionism embodied in the Unlawful Activities (Prevention) Act, 1967 itself has demonstrated the limitations of a legislative approach. Secessionism was contained in Jammu and Kashmir by the Indira Gandhi-Sheikh Abdullah accord of February 1975 not by the ban on the Plebiscite Front on the eve of the 1971 general election. The law itself is quite adequate. Only it cannot be a substitute for statesmanship. It can be used very effectively to tackle secessionism even as it stands today should a political approach fail.

Despite the Act of 1967, however, the Terrorist Act brings in secessionist activities under the definition of 'disruptive activity' in section 4 which is substantially similar to the definition of 'unlawful activity' in the 1967 Act. Why then the new Act at all?

Let us turn then to the part of the new Act which deals with terrorist acts as defined in section 3. In what respects has the definition of "terrorist" in section 2(1)(h) of the Terrorist Affected Areas (Special Courts) Act, 1984 been found to be inadequate. How are the special courts of this Act less effective than the 'designated courts' of the new Act?

The 1984 Act defined a 'terrorist' as a person who indulges in wanton killing or in violence or in disruption of services or communications or damaging property with any of the four specified objects. These are putting the people in fear; disturbing harmony between groups; coercing or overawing the state; and endangering the country's sovereignty or integrity. It is wide enough even to cover legitimate trade union activity.

What section 3 of the 1985 Act does is to omit the last object—undermining the sovereignty and integrity of India—and treat it under a separate head, 'disruptive activity', which is substantially the same as 'unlawful activity' of the 1967 Act. As for the other three objects mentioned in the definition in the 1984 Act, they are repeated in section 3 of the 1985 Act with greater verbiage but with no substantial difference.

It is an utterly unnecessary piece of legislation enacted at a time when Punjab was already reeling under the excesses of the 1984 Act. It was the result of an instant and typical reaction to the transistor bombs. An able Police Commissioner, Ved Marwah, was able to bring the offenders to earth swiftly without the aid of the new Act before it became law. On the other hand, no amount of legislation will suffice in the hands of an incompetent police chief and his force.

What is really needed for genuine crime detection and prevention is competent police intelligence, investigation and prosecution. The existing law is fully adequate for that. Under section 41 of the Criminal Procedure Code any police officer can arrest without a warrant any person on 'reasonable suspicion' of his having been concerned in any cognisable offence. Under section 151 he can arrest without warrant a person who is 'designing' to commit such an offence. Thus for the crucial stage of putting the offender or planner of offence behind the bars immediately the law is more than adequate. Preventive detention laws are unnecessary.

The Act is worse than unnecessary. It is insidiously dangerous. It defines terrorist and disruptive activities in sections 3 and 4, respectively, and proceeds in section 5 to endow the Government of India with enormous power to make rules the violation of which is punishable with arrest, trial and imprisonment on conviction. The rules can provide for 'preventing the disclosure of official secrets' and also for 'ensuring the accuracy of any report or declaration legally required of any person'. The threat to freedom of the press is obvious.

The Rules are yet to be framed. They should be carefully scrutinised when they are published.

The provisions in the Act for the trial of offences are draconic and have been universally attacked by civil liberties bodies and persons concerned with civil liberties. The police are empowered to keep a suspect under remand for 90 days in case of murder and 60 days in other cases without furnishing the charge-sheet for a whole year. Under section 17(5), the suspect cannot be released on bail if the public prosecutor opposes the application unless the "Court is satisfied that there are reasonable grounds for believing that he is not guilty of such offence and that he is not likely to commit any offence while on bail".

The Union government can transfer cases from one state to another. True, the concurrence of the Chief Justice of India is required on a motion by the Attorney-General. But transfers should be left to the Chief Justice to order, not merely to concur with.

There is also the provision for summary trials in cases where the offence is punishable with imprisonment for less than three years. What is the logic behind this? It is the unstated, unstatable proposition that safeguards for fair trial are relaxable in cases where grave charges are levelled. Incidentally, not only are committal proceedings dispensed with but prosecution can be launched by a private individual even without a police report.

Section 18 of the Act empowers the Centre to enforce the Act itself rather than through state governments. It is a provision of dubious constitutional validity and so is the Act. Entire 'public order' is exclusively a state subject and combating terrorist activity is part of maintenance of 'public order'. The Centre enjoys the power concurrently with the state to legislate on 'criminal law' but neither can use this to create offences in regard to matters in each other's list. Thus the Centre cannot create offences against 'public order'. It can amend the Penal and Criminal Procedure Codes but not legislate on 'public order'.

The Act is, therefore, as unconstitutional as it is unnecessary and vicious.

# Diversifying for Rural Market

### Hansavivek

*ATUL PRODUCTS* is seeking an industrial licence to manufacture 100 tonnes each of the two herbicides, metoxuron and isoproturon. The company has got a letter of intent for the manufacture of 950 tonnes of isocyanates, which are intermediates of these herbicides. On a reassessment of the herbicide market, the company is modifying the project for the diuron plant. It is still awaiting registration of tetradifon from the Central Insecticides Board. Due to serious difficulty faced in procuring meta dinitrobenzene, the company has started manufacturing it for captive use by utilising the spare capacity of its plants. A plant for making monochlorobenzene for captive use is also being installed. The government has finally rejected the company's application for the manufacture of DAP. The R and D department translated successfully processes for some intermediates on the hydrogenation pilot plant. The plant for removal of mercury from the caustic soda plant effluent, based on a process developed by it, has been successfully commissioned. The department has developed processes for some pesticides and their intermediaries and the company intends to put up plants based on these processes. The work on improving the efficiency of some intermediates and dyes as well as on developing processes for additional products is going on satisfactorily. The modernisation of the naphthol plant was completed and the new plant has been commissioned. The first phase of expansion of the DCP plant from 1,500 tonnes to 2,500 tonnes per annum has been completed. The company has also made changes in the caustic soda plant to improve its product mix.

The company has earned a gross profit of Rs 6.31 crore against Rs 5.72 crore in the previous year following increase in sales from Rs 66.94 crore to Rs 77.46 crore. Profit margins have been lowered due to the change in the method of valuation of stock of finished goods and materials-in-process from full absorption cost to direct cost basis. This has resulted in inventory being lower by Rs 2.94 crore and consequently the profit before tax is lower to that extent. The net profit is Rs 2.13 crore (Rs 1.25 crore). Dividend has been stepped up by 4 points to 20 per cent and is covered 1.42 times by earnings as against 1.04 times previously.

The company's plants worked satisfactorily and there was an overall rise in production. Better performance could have been achieved but for the acute shortage of naphthaline during the first half of the year. Moreover the textile industry, the main consumer of the company's dyes, passed through an acute financial crisis and one of the worst slumps in its history which resulted in closure of several mills. In spite of the trouble in Punjab and riots in the Bhiwandi area, the company was able to increase its sales of Atul Dyes. Sales of pharmaceuticals also improved. The directors point out that the sale of quiniodochlor is expected to go down in the future, as the use of halogenated hydroquinolines is being discouraged in the country and the company's main buyer, Hindustan Ciba-Geigy, is discontinuing its purchases. There was a substantial increase in the sales of chemicals. Intensive efforts to increase the sales of Atic Dyes resulted in an increase of 22 per cent. The company received recognition as an export house last year and is making vigorous efforts to increase its exports. During the year, exports increased from Rs 4.50 crore to Rs 5.78 crore. There was an overall increase in costs of raw materials, coal and electricity. Industrial relations continued to be cordial. The Industrial Tribunal has now made an award that the settlement arrived at with the recognised unions in 1982 was fair and just. A fresh charter of demand for revision effective from January 1 last has been received by the company. The company and the recognised unions have jointly applied for reference for adjudication of the demand by the Industrial Tribunal and orders have been accordingly passed. The company proposes to issue non-convertible secured debentures of the aggregate face value of Rs four crore on private placement basis to UTI to augment its long-term working capital. The subsidiary, Cibatul, has shown an impressive increase in sales as well as gross profit. It has commissioned the plants for polyaminoamide and vinyl ester resins. S S Baijal and Sunil S Lalbhai were appointed as additional directors with effect from June 13, 1984. Lalbhai took up the office of managing director from July 1, 1984.

*ROCHE PRODUCTS* has earned a lower gross profit of Rs 129 lakh in 1984 against Rs 136 lakh in the previous year even though it achieved a record increase of nearly 32 per cent in turnover from Rs 22.26 crore to Rs 29.22 crore. The drop in profit margins has occurred due to steep increases in raw material costs. Wages and interest on borrowings have also increased significantly and could not be recovered in increased prices due to the stringent controls of the Drugs (Prices Control) Order. The revision in the government's drugs policy, which was expected during the year, did not materialise. An increase in the price of Vitamin 'A' was granted in 1985 and the company is pursuing its applications for upward revision in the prices of all other products. With depreciation claiming more and tax liability less than in the previous year, net profit is unchanged at Rs 28 lakh. The directors have raised dividend from five per cent to eight per cent which is also payable proportionately on the additional capital raised by a public issue. The new shares were allotted on October 22, 1984. The proposed dividend will require over Rs 33 lakh (Rs 20 lakh) and is thus slightly short-earned. The company was able to step up export sales from Rs 124 lakh to Rs 574 lakh. The company has taken a credit of Rs 22 lakh, being refund received against provisional assessments of prior years and other taxation adjustments. To comply with the provisions of FERA, the company made an issue of 8,10,900 equity shares of Rs 10 each to the Indian public at a premium of Rs 2 per share and received an excellent response. Simultaneously, it also issued 2,43,270 secured non-convertible debentures of Rs 100 each which too was well received. After obtaining the government's permission, 50 per cent of the excess subscriptions were retained and 3,64,905 debentures were allotted on which Rs 50 each has been called up. The re-appointment of J Tanner as the managing director has been approved by the Central government for a period of five years from February 11, 1984.

*ASEA* is continuing to expand and achieve rapid growth, and to that end, investment proposals for the manufacture of SF6 and vacuum breakers in its switchgear division at Nasik are well under way. The company has received the capital goods licence for import of machinery for manufacture of these breakers. It is also actively engaged in its project for induction and melting furnaces, for which it already possesses an industrial licence. The company is now seeking approval of the government for the collaboration agreement. Besides, further investment opportunities, are being examined by the management. Meanwhile, the company has suffered a setback in its financial results, in 1984. Gross profit has dipped from previous year's Rs 146 lakh to Rs 142 lakh despite advance in sales from Rs 17.53 crore to Rs 26.74 crore, reflecting a sharp decline in profit margins. Substantial initial costs incurred in connection with the new factory at Bangalore, which houses the electronics and relay divisions and which commenced production from the second quarter of the year, and heavy interest burden were the main factors responsible for the reduced profit. Severe competition in the electrical industry in the country also lowered profits. With reduced tax liability, however, net profit has increased from Rs 77 lakh to Rs 87 lakh. Considering the bright outlook for the future, the directors have raised dividend by a point to 19 per cent, which is covered 2.72 times by earnings against 2.85 times previously. The company received during the year orders worth Rs 35.95 crore compared to Rs 22.4 crore during the previous year, leaving a healthy backlog of Rs 40.5 crore at the end of 1984. A large portion of the orders received is for imported equipment from the principals, Asea of Sweden. Upholding its position as a leader in electrical transmission technology, the Swedish company secured the first contract for $ 42 million for a high voltage DC system in India early this year. Of this, Rs 7.5 crore has been apportioned to the Indian company for the local portion of the contract. This order is not included in the aforesaid order backlog figures. The electronics factory has commenced manufacturing operations in 1984 and has sizeable orders on hand for despatch during the current year. The products offered by the division are accepted by customers for their technical superiority and the new Bangalore factory should contribute substantially to the company's business during 1985. A K Thiagarajan was appointed as managing director for five years with effect from July 1, 1984.

*RELIANCE TEXTILE INDUSTRIES* is on the threshold of spectacular growth as a result of the massive deversification programme now under implementation. According to Dhirubhai H Ambani, Chairman and Managing Director, the entire programme comprising four major new projects and the expansion of the polyester yarn capacity to 25,125 tonnes will be completed within 24 months, much ahead of schedule. The company would be commissioning (i) a Rs 166-crore project for the manufacture of 45,000 tonnes of polyester staple fibre per annum in technical collaboration with Du Pont of USA by end 1985; (ii) a Rs 288-crore integrated project to annually produce 75,000 tonnes of purified terephthalic acid (PTA) from indigenous raw materials in collaboration with ICI of UK and UOP Processes International USA by end 1986; (iii) a Rs 91-crore project to annually manufacture 40,000 tonnes of mono ethylene glycol (MEG) by early 1987; and (iv) a Rs 129-crore project to annually turnout 50,000 tonnes of linear alkyl benzene (LAB) by early 1987. To raise part of the finance for these projects, the company has already tied-up Rs 252-crore as foreign exchange requirements and would be coming out on June 3 with a non-convertible debenture issue of Rs 100 crore. Highlighting the possible impact of these projects on the company's performance at the annual general meeting in Bombay, Ambani pointed out that there would be a sizeable jump in the company's turnover and profits in the coming years. Besides, net worth which had gone up over the last seven years from Rs 10 crore to Rs 246 crore, would be more than double at about Rs 550 crore, while the fixed assets which had risen to about Rs 520 crore by end 1984, would jump to Rs 1,200 crore in the next two years. In spite of this massive investment programme, he stressed, the company's debt equity ratio would remain well below 1.3:1 against the accepted norm of 2:1, enabling the company to take up additional projects involving a further outlay of Rs 800-1000 crore. As the company's base gets widened, it would be easier for it to take up bigger capital intensive projects and move forward at a much faster rate. He revealed that the management is already on the look-out for opportunities of fresh investment in some other projects of national importance. About the current year's prospects, Ambani pointed out that sales had amounted to Rs 240 crore in the first four months of the current year and were expected to touch Rs 750 crore for the whole of the year, while the company's reserves by the end of the current year were expected to exceed five times the paid-up capital.

**EDUCATION**

# Quality over Access

## Responding to the Demand of the Elite

### Krishna Kumar

SOON after the Lok Sabha elections last year three persons were named for sorting out relevant ideas for the formulation of a new education policy. Initially it appeared that these three, namely P L Malhotra, Moonis Raza, and P N Srivastava, would constitute a formal advisory group. However, the role and status of the group were never precisely stated. In early April this year when the Union Education Minister replied to the debate in the Lok Sabha on his ministry's budgetary demands, he denied the existence of any committee. He said that many eminent educationists were being consulted. In addition to such consultations, he said, the recommendations of the different commissions appointed since independence could also be used for preparing a new educational policy. By the beginning of the academic session 1985-86, more specifically July 1986, the new educational policy will not only be ready but operationalised as well.

Three major issues that have been raised so far in the context of the new policy are: delinking of degrees from jobs, the introduction of modern techniques and equipment in education, and the starting of a 'Central' school in each district of the country. The idea of an 'open university' has also been mentioned as one mode of the use of modern communication technology in education. The common core of all these ideas is the concern that the quality of education available in the country is declining, and that the decline must be stemmed.

The suggestion of delinking of degrees from jobs is rooted in certain assumptions: first, that far too many young people are attending institutions of higher education; second, that a large number among them are attending merely for the sake of qualifying themselves for general service-type jobs; and third, that job-orientation dilutes the pursuit of education and knowledge. If we follow this set of assumptions, we arrive at the conclusion that the quality of higher education can be raised by dropping the job-oriented element among the students, in other words the ones who attend classes because they want a BA or BSc degree in order to become eligible for a job.

It is difficult to say whether anyone ever pursued education purely for its own sake, without any desire for power, status, or livelihood at the end of an educational career. Suppose we grant that there are such people, it can be safely assumed that such people will be members of the richer sections of society. Only they can be expected to afford to completely obviate the anxiety that lesser mortals feel about the outcome or use of any pursuit, physical or intellectual. The lesser mortals, whose presence in colleges and universities allegedly hampers the pursuit of education for its own sake, are largely members of the poorer sections of society—sections whose struggle for education is condemned to be polluted by the struggle for existence. The term 'poorer' can only be used in a relative sense here as there are enough studies indicating that the truly poor (by whatever standard we identify them; let us say, those below the poverty line) do not even have a token representation in higher education. Their children are forced to leave the educational system long before higher education starts. The 'problem' that delinking of degrees from jobs is supposed to solve has been caused mainly by the children of the relatively new entrants to the middle class, including the rural middle class. The 'delinking' thesis offers a psychological solution to the problem of population in India's 3,625 colleges. The solution consists of doing away with the factor that motivates the majority of students, if not all of them, namely the prospect of a job at the end of a degree programme. The 'delinking' thesis proposes that the government and other major employers should stop using the undergraduate degree as a minimum requirement for the bulk of service occupations.

Whatever the positive and negative features of 'delinking' may be, it is erroneous to describe it as an aspect of educational policy. If it is implemented, it will form a part of employment policy, and its only link with education would rest on the hypothetical influence that delinking would have on the psychology of the job-oriented among college and university students. It is not clear whether 'delinking' will actually be tried, and if so, when. Equally unclear is the method of deciding eligibility for service jobs that will replace the present degree criterion. Ideas like a National Merit Examination at the end of the secondary stage have been discussed in some quarters, especially the National Institute of Educational Planning and Administration. Another means of disorienting a large section of youth from colleges is vocational education, and this great idea of the post-World War I period is going through yet another round of seminars these days. Evidently, since the first mention of 'delinking' five months ago, its complications have been understood, and its fate may be, like that of the initial three-member committee, to be reconsidered as many times as it would take to file it away.

At the school stage, a major proposal that has been mooted is that of starting a 'Central' school in every district. At present, 'Central' schools constitute a small, elite sub-system within the government's network of schools. They cater mainly to the children of the Central government's employees. The proposed 'Central' school in each district will have places for the meritorious among the district's children, both rural and urban. Most likely, the meritorious will be selected on the basis of examination results and admission tests. The selective treatment that district 'Central' schools will offer will be based on the idea that separation of the worthy from the ordinary is necessary for harnessing the country's talent. In a society where talents have long been bounded by caste-grouping, new kinds of talent cannot be generated without allowing children of all social strata, both sexes, and different levels of manifest merit to stay and study together for as long as possible. Already, the rise of private schooling has set us in the opposite direction—towards further inbreeding of merit. By enlarging the 'Central' schools network, the government will strengthen the tendency that private schooling has initiated with its absurd procedures of selection among infants.

Between the two major concerns of education, namely access and quality, the government is obviously more inclined towards the latter. The only ideas currently being floated in the context of access are 'open university' and the expansion of non-formal education. Whenever the new educational policy is announced, we can expect it to reiterate the government's intention to fulfil the Constitutional promise of universalising elementary education, mainly by expanding the network of non-formal education and partly by increasing the number of schools. Non-formal education and 'open university' will act as shields, howsoever weak, against possible criticism that the government is neglecting the poor. The real emphasis will be on responding to the demand of the elite for an education system that works— better schools for their children (to be legitimised as pace-setters for other schools that do not work), pan-Indian curricula and examinations, computers, and value-orientation (a euphemism for revivalist orientation of school culture). These likely segments of educational policy, if and when it is announced, will steer the system away from the course that progressive developmentalists like Mudaliar, Srimali, Kothari and Naik had charted in the ethos of the first two decades after independence.

## SCIENCE AND TECHNOLOGY

# Whither Indian Aeronautics?

**Swaraj Bansal**

NO less than the Scientific Advisor to the Ministry of Defence and the President of the Aeronautical Society of India, V S Arunachalam, made a pointed reference to the dismal performance of aeronautics in India during the last twenty-five years while inaugurating the Society's 'Special Symposium on Technology Challenges of Ongoing Aerospace Programmes' at Trivandrum in April. Arunachalam related the failure of the industry to the lack of confidence in indigenous technology among its users.

The symposium consisted of eight invited lectures by eminent professionals from aerospace. The presentations, with slides and all, were informative but there was no debate or questions.

If the objective of the symposium was to draw the attention of the aeronautical professionals to the ongoing aerospace programmes and related technology requirements (challenges in fact), the symposium was far from achieving this objective. Firstly, it was not an 'open' meeting, in the sense that all the speakers were 'selected' and did not quite represent either the aerospace programmes or aerospace expertise. Thus there was no aerospace designer from HAL, ADE, IISc, or even ISRO and the IITs who could have made a technological contribution. There could not be a free debate on the aerospace programme and related issues of technology development; also, there was little scope for a critical appraisal of the current state of technology.

Secondly, within the framework of the selected talks, most of the presentations amounted to mere enumeration of the respective organisation's limited programmes with some reference to problems of technology development. For instance, the real technology challenge in productionisation of aircrafts lies in translating designs into hardware through die and tool designs, machining skills, application of numerical machine programmes for complex designs, etc, and not in the procurement of parts or raw material. Similarly, instead of focusing on the technological challenges in producing indigenously high-grade electronic components, the focus was on systems design in avionics. There is a symbiotic relationship between components/circuits and systems design, the latter not being immune to technological break-throughs in the former. The number of strategic space technologies which are being planned and indigenously developed and which still hold formidable challenges were not highlighted. Little light was shed on the role of R and D in the existing aerospace industry by the paper on the subject.

This brief resume of the Aeronautical Society's symposium reflects the existing state of the aeronautical industry. The history of aeronautics in India shows that project after project of the HAL has been shot down systematically in the past 25 years and the user agencies (primarily the Indian Air Force) have repeatedly gone abroad for the smallest of their requirements. Today even a small 20-seater light transport aircraft has to be imported (the case of German Dornier).

The pattern is all too familiar. The IAF puts up its requirements (operational specifications, to be precise), deliberations of sorts, mostly cosmetic, are held in aeronautical circles and claims to develop indigenously whatever is required are ridiculed. When nothing comes of it all for a while, the decision to import is taken, first a few parts (starting with the engine) and then the whole aircraft. With foreign collaboration, a productionisation plan is set in motion. Often, even here, first some parts and then the pre-assemblies and assemblies are imported. By the time the first assembly of the proposed aircraft rolls out, the aircraft (and its technology, whatever that may mean) is obsolete. Enter the next project and history repeats itself.

The forthcoming LCA (Light Combat Aircraft) is a prestigious project for the Indian aeronautical industry. The estimated cost runs to a four figure sum in crore. The aircraft is supposed to be a multi-high technology sophisticated weapon system compatible with the contemporary aircraft systems of the world in the 1990s. The aircraft is required to be delivered in 1990, but the project, barring a few wind-tunnel tests and studies on different configurations (three to be precise) has made little progress. The technology-options in configuration design, propulsion system (engine), material selection, avionics and weapon sub-systems (a very sensitive area for technological compatibility) are yet to be identified, finalised and major designs frozen. Besides these technological inputs (which are presumably available in the various far-flung aeronautical establishments in the country), a work of this nature requires large project teams with commitment and flair and experience, a massive co-ordination effort, integration and control, and above all systematic organisation development which evolves gradually from specific project requirements and meets its technology and sub-system development objectives in a controlled manner. This is the minimum recipe for delivering the goods in any high-tech multi-discipline project.

No such thing is happening in this case; it is possible that the project is already five years behind schedule. Many in the government might have already mounted a search in the international markets for an equivalent aircraft to fit the slot.

The atomic energy and space programmes, for example, delivered the goods because they had a mandate backed by massive infrastructure and organisational effort. All high technology development needs commensurate organisational effort, not only in excelling in technology development which is essential but also in systems integration, co-ordination and management. This in turn needs a systematic effort to build institutions (organisations of professionals engaged in various tasks towards common goals) where these efforts are culminated to bear fruitition. It is the harmony and synergy of these efforts that result in the success of large projects.

The aeronautics profession in India, in spite of individual pockets of excellence, is rather scattered even now. The profession has failed to respond to the demands placed on it and has consistently succumbed to the softer options of importing as against pooling its resources to put its house in order. Government policy too has been far from helping the building up of self-reliance in aeronautics. Government has jumped from one aircraft to another instead of planning for 10 to 20 years into the future and developing the requisite infrastructure to supply these weapon systems of the future. This is possible only through (a) government emphasis on self-reliance through concerted technological and organisation build-up, and (b) a kind of 'inner liberalisation' of the profession to permit larger participation and debate which would facilitate institution-building. Without such transformation there is no hope for aeronautics in India.

## CEMENT

# A Decontrol Success Story

**Sheetal Shankar**

BY all accounts the cement industry has fared remarkably well in the period following the dual price policy introduced in February 1982. This policy brought in a two-tier pricing system consisting of a levy price for government supplies and an open market price. The levy quota was roughly two-thirds of installed capacity while the balance could be disposed of in the free market. The policy thus amounted to partial decontrol of cement. The states were left to work out their own distribution machinery for quota cement. The levy price was raised, first in February 1982 and again in July 1984, to allow for cost escalations.

The new pricing policy signified a radical change from past policy. The government's administered pricing policy has involved somewhat conflicting objectives which have proved hard to reconcile. This has particular reference to the effort to secure a 'reasonable' price to consumers, while at the same time striving to ensure that producers get a 'fair' return on investment so that the requisite capital may continue to flow into the industry. Based on the recommendations of expert bodies appointed from time to time, the policy experimented with various alternatives ranging from a uniform price for all firms to a three-tier system in which three different prices were applicable each to high cost, medium cost, and low cost firms. Distribution controls went hand in hand with price controls. But cement prices were allegedly pegged at unremunerative levels, adversely affecting profitability. Meanwhile the capital cost of new plants went up sharply, thwarting the flow of fresh investment into the industry. The industry thus failed to grow apace with growing demand and cement shortages became acute, particularly from 1965 onwards. In the late seventies shortages were so acute that the Sixth Plan had to allow for cement imports to bridge the demand-supply gap, though the domestic potential remained unexploited. Against an expected consumption of 38 mn tonnes by 1984-85, the Plan allowed for cement imports of 2-3 mn tonnes a year.

Prior to the 1982 policy change, the post-Independence cement situation had on the whole been one of demand exceeding supply, though a few sporadic years of excess supply could be cited. The relatively low volume of production constrained consumption and a general atmosphere of shortage encouraged blackmarketing in the commodity.

Apart from allowing for imports to relieve immediate shortages, the Sixth Plan, in a sober reckoning, was critical of past policy. This paved the way for the liberalisation of price and distribution controls which were finally announced in February 1982. As mentioned, the industry's performance during the period of partial decontrol has been remarkably good. There now seems to be promise that the era of shortages, blackmarketing and constrained consumption will come to an end as the gains are consolidated.

For every plan period upto the end of the Fifth Plan capacity installation in cement had trailed behind the target based on projected demand (Table 1). The Sixth Plan has been the first in which the achieved capacity of 44 mn tonnes has exceeded the target of 43 mn tonnes. During the Sixth Plan the industry will have added close to 22 mn tonnes to the existing capacity of 22 mn tonnes in 1979, a performance equal to the achievement under all the previous plan periods taken together.

Though the production target for the Sixth Plan has not been fully attained, the industry has increased annual production by 13 mn tonnes. Thus by the end of the Sixth Plan the industry was producing 32.5 mn tonnes against a production of 19.5 mn tonnes at the end of the Fifth Plan. The increase in production equals the achievement of the preceding 25 years. With the commissioning of new capacity and improved capacity utilisation, the annual rate of production is likely to go up considerably in the coming years.

With improvement in domestic production and availability of cement, the import requirement has been reduced, with imports in 1984-85 estimated at only half a million tonnes.

Data relating to the financial performance of selected groups of cement com-

panies are available for the year 1982-83, the first full year of dual pricing. They provide evidence of a spectacular improvement in financial performance within a year of the change of policy. Table 2 gives selected indicators of the financial performance of public sector cement companies under the Cement Corporation of India (CCI) in 1981 and 1982. These companies accounted for around eight per cent of total production of cement in these years. It may be seen that in 1982-83, sales were 270 per cent of the previous year's sales, while profits were 280 per cent of the previous year's profits. The various profitability ratios also show very significant improvements. A massive ploughing back of profits resulted in a large increase in reserves and surplus and a sizeable increase in the proportion of internally generated funds to total funds raised.

An idea of the performance of private sector cement companies can be obtained from the ICICI's report on the financial performance of a sample of ICICI aided companies for the year 1982-83. Of the 417 companies in the sample belonging to different industry groups such as automobiles, fertilisers, machine tools, shipping, textiles, etc, nine companies belonged to the cement group. In 1982-83, most industry groups exhibited a deceleration of sales and profits. But in the case of cement there was a significant increase of both sales and profits. Table 3 gives selected indicators of the financial performance of cement companies provided by the ICICI report. The considerable improvement in profitability ratios may be noted. The increased profits were utilised to augment reserves. It may be seen that while the ratio of dividends to pre-tax profits declined drastically, there was a corresponding increase in the ratio of retained profits to pre-tax profits. This resulted in a 400 per cent increase in the reserve fund in 1982 compared to the previous year.

TABLE 3: FINANCIAL PERFORMANCE OF SELECTED ICICI AIDED CEMENT COMPANIES

| | 1982-83 | 1981-82 |
|---|---|---|
| (1) No of companies | 9 | 9 |
| (2) Profits before tax as percentage of sales | 13.10 | 1.50 |
| (3) Return to capital employed (percentage) | 22.50 | 9.70 |
| (4) Dividend as percentage of pre-tax profits | 14.30 | 85.90 |
| (5) Reserves and surpluses (Rs crore) | 102.20 | 24.07 |
| (6) Retained profits as percentage of profits before tax | 82.10 | 14.10 |

| | Cement | All Industries |
|---|---|---|
| 1971 | 96.7 | 95.1 |
| 1975 | 84.8 | 97.3 |
| 1981 | 154.7 | 191.7 |
| 1982 | 237.5 | 180.7 |
| 1983 | 282.1 | 198.0 |
| 1984 (av for 8 mths, January-August) | 260.7 | 203.7 |

*Source*: Central Statistical Organisation.

The cement group planned the largest increase in capital expenditure for modernisation and expansion in 1983-84 and 1984-85 as compared to other industry groups in the ICICI portfolio. The improved reserves position for 1982 increased the scope for internal financing of capital expenditure, but the planned investment to the tune of Rs 213 crore in 1984-85 on top of an investment of Rs 186 crore in the previous year would necessitate fresh borrowings on a large scale.

The impact of the new policy on the investment climate in the cement industry is readily visible in the behaviour of the index of cement securities (Table 4). The index increased by 82.8 points in 1982 over the previous year, against an increase of only 58 points in the course of ten years between 1971 and 1981. The index increased by a further 44.6 points between 1982 and 1983, and though there was a slight decline in 1984, the index continued to be high. The buoyancy of the investment market for cement compared to other industries is reflected in the fact that the level of the cement index in 1982, 1983 and 1984 was higher than that of the composite index for all industries in these years. It may be noted that the opposite was the case in the period 1971-1981.

It seems that the twin objectives of the new policy of increasing production and improving financial position of firms to enable them to finance a large part of expansion and modernisation plans from internal sources are within reach. Within a short period of three years the stagnation of the past has come to an end.

New from SAGE Publishers of the Professional Social Sciences

**Quantitative Applications in the Social Sciences**

A Sage University Papers Series

**Series Editors: Richard G. Niemi and John L. Sullivan**

This phenomenally successful series (over 4,00,000 copies sold worldwide!) exists to bring quantitative methods within easy reach of social scientists—many of whom have limited experience with statistics and mathematics.

SAGE is pleased to announce six new volumes:

# Anti-People Development
## Case of Inchampalli Project

(By a Special Correspondent)

THE Central Indian forest region has been in the news recently not only for the increased activity of various Marxist-Leninist groups but also for the 'developmental' activity being undertaken by the Central and state governments there. One such project is the Inchampalli multi-purpose dam project which concerns the Madhya Pradesh, Maharashtra and Andhra Pradesh governments. This project has evoked considerable opposition in Maharashtra since it is the southern and eastern portions of Gadchiroli district that are going to be most adversely affected by it.

The Gadchiroli district, created from the larger Chandrapur district only three years ago, lies at the eastern end of Maharashtra bordering both MP and AP. A large part of the district is under forest and the southern part, the old Sironcha taluka, has 83 per cent of its total area under forest. These are part of the forests that stretch from Chandrapur through Adilabad into Orissa. The district is also potentially rich in minerals. It is said that there is iron ore to be found near Bhamragadh. Before the Tatas set up their steel plant at Jamshedpur, they had apparently considered setting it up in this area.

These hilly dry forests are inhabited by tribals. According to the 1981 Census, 41.5 per cent (2.5 lakh) of the total population comprise scheduled tribes. There is no industrialisation in this district and an overwhelming majority of the population is dependent on agriculture and the forest for its livelihood. Even agriculture is backward with single crop, subsistence cultivation being the norm. The main crops are jowar and rice. There is very little irrigation, though the district is criss-crossed by the Godavari, Wainganga, Pranhita and Indravati rivers.

An agreement was reached between Andhra Pradesh, Maharashtra and Madhya Pradesh on August 7, 1978 to take up the Inchampalli project as a joint venture on the river Godavari which acts as a boundary of the three states. The agreement was signed in the days when K L Rao was Minister for Irrigation in the Central cabinet. Immediately on reaching the agreement the Andhra government had a survey done. Though this is ostensibily an inter-state project, in fact almost all the benefits of irrigation will go to Andhra Pradesh. Apparently the Maharashtra government was told that if its approval was not forthcoming then perhaps sanction for some other projects might not be granted.

The Inchampalli hydel and irrigation project is to be built about 12 kms from the confluence of the Godavari and Pranhita rivers in Manthani taluka of Karimnagar district of Andhra Pradesh. The 116.13 metres high and 2,056 metres long dam will submerge 1,00,858 hectares of land in 146 villages of the three states. Of this, 39,333 hectares are in Maharashtra, of which again 19,593 hectares are forest land. Along with Inchampalli, a feeder dam is to be built near Bhopalapatnam along the MP-Maharashtra border on the Indravati in Maharashtra and an equivalent area in Madhya Pradesh. 19,013 hectares of forest land in Maharashtra are likely to be submerged. While the Inchampalli dam is estimated to cost Rs 362 crore, the Bhopalapatnam project will cost Rs 403 crore. Besides these two dams, the project envisages a series of smaller dams northwards at Tutuli, Kathani, etc.

The Inchampalli dam will generate an estimated 660 megawatts of power and irrigate 1,31,400 hectares, while the Bhopalapatnam project's estimated capacity for electricity generation is 1,225 megawatts. The three states of MP, Maharashtra and AP are to share the electricity in the proportion of 38:35:27. From the Inchampalli project 1.6 mn acres of land in AP are likely to be irrigated while 16,000 hectares in Maharashtra will get lift irrigation facilities. The cost has to be borne by the states in the proportion of 76.10 per cent (AP), 11.40 per cent (MP), and 10.50 per cent (Maharashtra).

### BENEFITS FOR WHOM?

If looked at a little closely, it becomes clear that the benefits claimed for the projects are not going to accrue to all sections of the population. The irrigation facilities will benefit those who have the land. The tribals in this region have neither the large holdings to be able to maximise the use of irrigation facilities nor the capacity to pay for them. Besides, with the entry of the Forest Development Corporation as a commercial enterprise to tap forest resources a large number of the tribal forest dwellers are becoming wage labourers.

Even in terms of the employment generated during the period of construction, how much the local people will gain is a moot point. It hardly needs stating that skilled labour will be inducted from outside the region. Even for unskilled workers, the general policy of contractors has been to bring workers from outside to prevent unionisation. Even if this does not happen, from the experience of other such projects it is obvious that local people will be absorbed partially in casual, temporary employment. For the Gadchiroli tribals this will mean a sudden transition from a settled life in relative isolation to a marginalised life dominated by 'outsiders'.

The monetary cost of the Inchampalli dam does not give an idea of its real cost, if we consider the loss of forest wealth, cultivable and uncultivable lands and rare species of animals and plants. The cost of completely uprooting a people cannot, of course, be calculated in terms of money.

In Maharashtra, it is land from the Sironcha and Etapalli talukas that will be submerged. About 40,000 hectares of forest land (the teak in this area is famous as being second only to Burma teak) will go under water. Even the Tehsil headquarters, Sironcha, a big village, will be submerged. Parts of the highway too will be submerged. The forest shelters rare species of flora and fauna which will be impossible to rehabilitate as stipulated in the Forest (Conservation) Act, 1980. This forest is also the habitat of a rare variety of wild buffalo.

Ecologically speaking, this multi-purpose project is a disaster. The process of destruction of forests in Maharashtra began at the turn of the century and at present the state has less than 30 per cent of its original forest cover. At the time of the transfer of power in 1947, the state had 39,000 sq kms of forest, but in 1963, according to a study of the NCAEER, only 14,000 sq kms of forest were left. Since then a further 4,400 sq kms have been denuded reducing the area under forest to about 10,000 sq kms.

According to a study by the Tribal Research Institute, Pune, "the likely loss of forest will be about Rs 3,372 lakh which is unrecoverable. The loss of forest will be a permanent national loss forever". Out of this total amount, the losss of Rs 146 lakh will be of high quality teak and other timber. It is estimated that the clearing of the forest for Inchampalli alone will yield 1,46,000 cubic metres of timber, 7,60,000 beats of fuel, 5,000 tonnes of bamboo over a period of 10 years. This would mean an annual destruction of 16,100 cubic metres of timber, 14,000 fuel beats and 500 tonnes of bamboo.

The Centre of Studies in Resources Engineering, Bombay, had taken up a survey in 1979 to assess the availability of natural resources in the region around Sironcha. 20 lakh tonnes of barium have been located at Amdali, about 16 kms from Sironcha, and at Devalamarri. It was estimated that there are about 10 mn tonnes of lime deposits of chemical, flask and cement grade. At Gorewada, near Kamalapur, deposits of graphite have been located while at Manlapur deposits of sillenite have been found. Iron ore has been located at Bhamragadh. Much of this wealth will be submerged when the two dams are built.

### ADVERSE IMPACT ON TRIBALS

The controversy about these two dams has arisen specifically because a major part of the area that will be affected has a high concentration of tribals and the area is full of forests. The mineral and other resources likely to be lost due to the project can be set against the power and water resources that are likely to be generated after the project's completion. Hence the most important aspect that needs to be considered is the loss in human terms that is likely to occur. Incomplete official estimates state that in the three states 66,000 people will be displaced due to the two projects.

The forest is inhabited by various tribes among the Gonds: the Madias, the Raj Gonds, the Parshans and a small number of Kolam as well. Most of them practice settled cultivation, but a section of the Madias, inhabiting the remote tracts of Bhamragadh area, still practice shifting cultivation in spite of the government schemes to force them to take to plough cultivation. They are all forest dwellers who have lived in this forest for centuries. Their economic and cultural life is inextricably linked to the forest.

Modernisation has come into the lives of these tribals not so much through the developmental schemes of the government as much as through the enhanced commercial exploitation of the forest wealth by the forest departments and paper mills. The activities of the Maharashtra Forest Development Corporation and the Ballarpur Paper Mills have brought the tribals into contact with a money economy and exploitative relationships. The increased forest regulations have curtailed their earlier access to the forest and its products, the sudden expansion of the administrative machinery of the forest department with forest guards and rangers have put them at the mercy of these newly created kings of the forest. Already the tribals and other forest dwellers in this area have faced a deterioration in their life and culture, they have found their earlier freedom curtailed and they have been reduced to potential labour for the forest department.

The uprooting of these tribals and their proposed rehabilitation outside the district, in a distant non-forest area like Nanded district, raises several questions. Firstly, will the new environment provide them with sufficient livelihood? Secondly, will they be able to culturally and socially adjust? Further, the tribals are to be compensated for the land under cultivation at the rate of Rs 4,000 per hectare. Here there is an additional complication in that many of the people do not have registered pattas to the lands they have been cultivating for years. How the work of compensation will be handled by the revenue department, notorious for its bureaucratic delays and corruption, needs little imagination to foretell.

Given the experience of past projects and the above background, it can easily be seen that these forest dwellers are not going to settle in Nanded to a better life of settled cultivation. Their economic condition is bound to deteriorate. They are most likely to become casual labourers at the mercy of contractors, factory owners, etc. The women will be forced into menial jobs and into the flesh market. Apart from the fact that the compensation being offered is measly, the exchange of land for money will further impoverish them. Unused to a money economy they are likely to be cheated by the more sophisticated plainsmen to part with the compensation money.

The deterioration in their conditions and increased exploitation in the past decade has led the forest dwellers to organise themselves under the banner of the Adivasi Kisan Shetmajur Sangathana (AKSS). The organisation has emerged all over Sironcha, Aheri and Etapalli talukas under the leadership of the CPI(ML) (People's War), inspired by the movements in neighbouring Karimnagar and Adilabad districts of Andhra Pradesh. In fact it is the growing influence of the AKSS that prompted the Maharashtra government to come down heavily on the efforts of the AKSS to hold its first conference at Kamalapur village in February 1984. Since then there have been waves of repression by the police in the three talukas. All this has created resentment and hostility towards the government and the police. The forest dwellers are thus in no mood to accept any project by the government which adversely affects their lives.

## POPULAR OPPOSITION

While the AKSS has expressed its opposition to the project and campaigns are being conducted at the village level, public action against the dam has been led also by Baba Amte, the well known social worker from Chandrapur. In February 1984, at his annual gathering at Hemalkasa (near Bhamragadh), Baba Amte spoke about the dangers inherent in the dam project. This was followed by a public meeting and morcha on April 9, 1984 at Gadchiroli. Apart from Baba Amte, Raja Vishweshwarrao from Aheri, ex-MP, and Lalshyam Shah from Rajnandgaon were also present at the head of the morcha. They tried to mobilise the people from both Maharashtra and MP. The memorandum opposing the entire project, including the proposed 20 dams, was submitted to the Collector. After that at his annual meeting at Hemalkasa in February 1985, Baba Amte once again reiterated his opposition to the project. Earlier Baba Amte had written to Prime Minister Indira Gandhi and this had elicited a reply from her which spoke in favour of preserving our natural environment. But to retain it, she wrote, would require an arduous struggle in which all conservationists would have to unite. Against whom the struggle will have to be waged was not mentioned by her, considering that it was her party at the Centre and the state which had approved the project. It must also be remembered that the Centre had virtually ordered the Maharashtra government to accept the project though the latter had been reluctant.

The first effort to stop the project began in 1980 when the Congress(I) MP from Chandrapur, Shantaram Potdukhe, brought the issue to the notice of the Centre as well as the state government. N K Tirpude, former Deputy Chief Minister of Maharashtra also took up a campaign against the Inchampalli project through his Vidarbha Vikas Mandal. Privately, many forest department officials in the state have also expressed their opposition to the project. But the World Bank, contractors and the rural and urban rich, who are interested in the Inchampalli-Bhopalapatnam project because of the irrigation and power it will provide, are advancing the argument that the destruction of the forests and the uprooting of the forest-dwellers are some of the inevitable costs of development.

Some liberal social workers organised a 'jungle bachao, manav bachao' convention at Sironcha to oppose the Inchampalli dam. Environmental and conservationist groups have also supported the campaign against the project. Considering that this project will inundate almost one and a half lakh hectares of land in the three states (much of which is prime dry deciduous forest, compared to 850 hectares of forest land that was to have been submerged in the Silent Valley project) the campaign against this project has so far been markedly on a low key. The project is likely to affect the central Indian forest belt beyond repair with serious ecological consequences. Most importantly, it will adversely affect the Gond population of the area, their economic, social and cultural life.

## NOT A PLEA FOR TRIBAL ISOLATIONISM

One argument that is being put forward about the negative impact of the project on the tribals is that the tribal culture will be destroyed, that the project will lead to tribal genocide. This concept of 'tribal culture' that needs preservation and protection is, however, rather vague. Apart from wanting the preservation of Gondi language, the Raja of Aheri, for example, has been able to say nothing more specific. The concept of tribal culture is also assumed to include the preservation of the tribal values of communal social life, religion, dance and song. But there is a pitfall in this argument. For the argument creates the impression that what is being sought is the preservation of the tribals in the conditions in which they have lived for all these decades. This is a revival of the isolation thesis, on the lines of the reservations for Red Indians in the US, to keep them in their primitive economy and life style—in short the fossilisation of a people.

There is no doubt, of course, that the sudden displacement and dispersal of these people from their forest habitat to a drought-prone plains area, from an economy where internal class structure and class relations have developed only to a limited extent to a semi-feudal economy with a sharp and developed network of class relations and a rigid caste hierarchy will not merely disorient them but completely disrupt their existing culture. Already we have enough examples of such disruption and its dehumanising effects on the tribals of the Chotta Nagpur plateau over the past century. The destruction of a traditional culture, the breakdown of social tics of co-operation with no alternative set of values except that of the market, have had the effect of marginalising, dehumanising and demoralising simple communities. But these are the effects of an economy controlled by and based on the principle of profit; they are the effects of the policy of 'development' pursued by the present ruling classes. When development is oriented towards the enrichment and enhancement of contractors, traders, industrialists and their likes it can only be at the cost of the lives and conditions of the masses, whether in their own environment or in another. And the impact of these developmental policies is already being felt even in the forest environment. The tribals have already become victims of the 'development policies' of the government.

The alternative to this 'development' cannot be stagnation as the above argument tends to project. The forest dwellers want and need development of their conditions. And this requires the political mobilisation of the forest dwellers, a mobilisation to understand, expose and resist the existing exploitative 'development'. This requires, essentially, opposition to the present state which is the main vehicle through which these development are being implemented, its socialist slogans being merely a cover.

The development of the forest dwellers can best be in their own environment through mobilising their own efforts, which includes opposing the exploitative nature of the state. And it is a recognition of this fact that has led the state to take repressive measures to crush any political organisation in the forest areas of central India—in Gadchiroli, Bastar and Adilabad. To save the people of this area, to help them in their efforts to develop and to save India's ecological balance, the government must be compelled to give up the Inchampalli-Bhopalapatnam project.

# Washington, Delhi, and the Sikhs

## Adventures in Wonderland

**Barbara R Joshi**

ON April 17, Indian newspapers carried a front page story, datelined UNI-Washington, and titled "Indian Embassy Strongly Protests US Congressional Caucus Hearing". The article went on to claim that Sikh separatists were successfully mobilising the US Congress on behalf of a separate Khalistan. In a subsequent story UNI continued to charge that "Hardline Sikhs, led by G S Dhillon, J S Bhullar, and Ralph Singh, are creating an atmosphere amenable to their secessionist cause". Parliament held a three hour debate, and a press release on April 19 assured the public that the government had lodged a strong protest with the US government in Washington and in Delhi.

Strange sequel to a seminar featuring lectures on Indian human rights issues by people urging steps to improve Indian unity. But then these are strange times.

The catalyst was a public seminar in the Reyburn Building in Washington on April 11, one of a series hosted by the Congressional Human Rights Caucus and a shifting array of human rights and citizen action groups. The seminar was to have been composed of four panelists—Ralph Singh, Barbara Joshi, and representatives who had been invited from the US State Department and the Indian Embassy—with Laurie Wiseberg, executive director of Human Rights Internet, a private human rights information agency, acting as moderator. We ended with three panelists. Leo Rose was sent by the State Department. The Indian Embassy declined the invitation in a letter that strongly protested "giving a human rights colouration to what is a purely political problem in India". The letter went on to argue that Sikhs were honoured and well integrated Indian citizens.

Laurie Wiseberg began the meeting by reading the Indian Embassy letter and expressing regret at a missed chance for dialogue. Barbara Joshi, reading from a paper made available to the audience, suggested that recent anti-Sikh riots should be seen as part of more pervasive problems. "Policy decisions based on short term political expediency, taken by a variety of governments, have established precedents and expectations that are dangerous for India as a whole, not just for one minority or another." After reviewing some recent instances of large-scale violence against a variety of caste, class, and religious target groups, the paper concludes by noting the growth and rationale of non-partisan civil and human rights organisations in India. "They are convinced that unless they can break the linkage between social violence and political authority—a pattern in which social violence is assured of political protection and after-the-fact political absolution—they will witness the destruction of both the nation and democracy. It is this logic that has led several of these groups—predominantly non-Sikh in composition—to press for a judicial enquiry into the Delhi riots of 1984, and even more importantly, for effective prosecution."

The second panelist was Ralph Singh, who now finds himself branded a hardline Khalistan separatist. Singh also read from a prepared text which was distributed to the audience along with an information packet featuring such items as the PUDR/PUCL report on the Delhi riots, "Who Are the Guilty?"; Madhu Kishwar's "Gangster Rule: The Massacre of the Sikhs" (*Manushi*, Winter, 1984); and Samata Era's "Army Action in Punjab" (Delhi, 1984). Singh's paper argues that denial of human rights makes "any hope of a lasting solution impossible. It is our hope, indeed our prayer, that this meeting today will provide the focus needed to begin a constructive dialogue aimed at the restoration of these basic freedoms to the Sikh community so that they may once more be free to contribute to the growth of their country". The presentation of this dangerous gentleman concludes with his own suggestions and a quotation:

> Perhaps a few suggestions: (1) Open Punjab. Let in some fresh air, in the form of press and human rights groups. (2) Hold an inquiry in Delhi, and punish the guilty. (3) Compile a list of casualties so that families may be relieved of their burdens. Especially the children. (4) See that the damage is accurately assessed so that Sikhs can start to rebuild, not just their own property but the country at large.
>
> "The unity of a vast country like India is achieved not in spite of but through diversity. Not by suppressing or merely tolerating diversity but by creatively recognising and accommodating it. The various group identities which constitute India should be given recognition, accommodation, a sense of belonging to the unity, of being partners and shareholders in the unity, not its servants." ("Army Action in Punjab", p 20.)

### STATE DEPARTMENT ON HUMAN RIGHTS IN INDIA

The last speaker, Leo Rose, has suffered the strangest fate of all. Rose is a professor at the University of California who is serving as a consultant to the State Department. At the meeting he condemned the previous speakers as biased, and strongly defended the Indian government's actions, a position congruent with that previously taken by the US State Department. He was subsequently quoted in the Indian press as suggesting that several leaders of the Indian government should be shot. The State Department now denies that he represented the Department. Since the organisers had asked for a State Department representative, and since the preceding speakers were, in large measure, responding to the Department's published views, perhaps it would be fairest to quote the Department's "Country Reports on Human Rights". Throughout its 1984 report, the Department takes occasional note of such cautionary voices as that of

Amnesty International, but reaches conclusions that read very much like those of the Government of India itself. For example, the November massacre of the Sikhs is described thus:

> Prime Minister Indira Gandhi's assassination on October 31 by two of her Sikh bodyguards triggered anti-Sikh rioting in New Delhi and elsewhere in northern India, resulting in the deaths of over 1,200 persons. Following his appointment as Prime Minister, Rajiv Gandhi appealed for an end to the anti-Sikh violence and ordered deployment of the army and other security forces to quell the disturbances. The government also offered to pay compensation to the victims of the rioting. As a result of an investigation into alleged dereliction of duty by the police during the riots, several senior police officials have been dismissed, demoted, or reassigned (p 1220).

Continuing caste/class violence is downgraded to the observation that

> Press reports of violence against scheduled castes or scheduled tribes have decreased from previous years. The basis of such violence is often economic, involving perceived threats to the economic position of higher castes by lower economic groups demanding legal minimum wages or land tenancy. The government provides some legal and physical protection to the victimised groups, and in the last two years the judiciary has taken an increasingly hardline against perpetrators of mass killings of harijans.

The case of Brahma Chellaney, charged with sedition when he became the only journalist able to provide eyewitness reporting on Operation Bluestar, raises no ripple of concern.

> The Constitution guarantees freedom of speech and, by extension, of the press. However, material which, in the view of government authorities, may incite religious or communal hatred is proscribed from print. In October the Punjab state government registered a case against an Indian citizen representing a foreign news agency under provisions concerning provoking riot and disaffection among communal groups. He had reported from Amritsar that some persons had been tied up and shot during an army operation there. The story also appeared in the Indian press. There is no indication that any other journalist was similarly charged (p 1225).

Not until the public question hour succeeding the seminar did Dhillon and Bhullar made their appearance, and then probably went unnoticed by most of those present. Their names are not familiar to most Americans, and neither brought up issues likely to attract attention. Dhillon complained of not being invited to participate and proceeded to complain further of too few industrial permits for Punjab. Bhullar praised his own exploits as a general and complained of declining Punjabi representation in the Indian army. A variety of Americans in the audience raised questions regarding the analysis and arguments presented by Rose. One also asked if the State Department would co-operate if any formal hearings were held, and was told by a visiting Department trainee that this was not a decision for the State Department to make. The meeting ended on a relatively positive note when Ravi Khanna, a Voice of America employee who had taped the proceedings, noted that just before the meeting he had seen a wire report announcing an official enquiry into the Delhi riots.

Long day. Tiring. Nothing very exciting—until hysteria broke loose in Delhi several days later on April 17.

Question: What happened between April 11 and April 17 to a story presented to the Indian public as a major threat to India's survival? Khanna of Voice of America has stated that he told a friend in UNI-Washington about the meeting, and that UNI later relayed the story to India. Several days later? If UNI—or anyone else—attempted to research a lead, they apparently did not contact the chairman of the House Foreign Affairs committee on Asia and the Pacific, Steven Solarz (D-New York City), who has been a focus of extensive (and legal) social lobbying by the Indian government and the larger Indian citizen groups. Solarz is reported by all human rights activists in Washington to be opposed to formal hearings on any human rights issues in India. Certainly UNI did not contact Ralph Singh until April 18, the day after its first story was released in Delhi, and then proceeded to repeat charges of separatism in spite of protest from their outraged victim. I have yet to hear from UNI, but perhaps I should simply count my blessings. Throughout the fracas, both UNI and Indian Embassy had easy access to the printed copies of the papers presented at the seminar. The Embassy has reached out quickly to international human rights agencies with offices in the US when concerned about persons of Indian descent in South and East Africa, Sri Lanka, and Southeast Asia.

Question: Were we watching a well-staged charade, or the unintended by-product of propaganda in which every Sikh is by definition a separatist/terrorist? Is there still a difference between charade and self-sustaining hysteria in the desperate world that has become Delhi? Certainly men like Dhillon and Bhullar will play Delhi's tune for their own ends. Once again it is Delhi itself that has boosted their support base by helping them claim influence they do not have.

Prospects: Back in America enthusiasm continues to build over visions of expanding private investment opportunities in India. Bhopal was just an accident; there's really nothing like a good dose of international private enterprise to cure any country's problems. There is even talk of celebrating the dawn of a new era with an arms deal. It is all so familiar—the yeasty blend of American geo-politics, multinational business, and authoritarian governments egged on by America's own vision of the kind of 'firmness' needed to create Third World stability. When pressures build beyond endurance and one more pot bubbles over, the American public will be invited to reflect on the fact that Third World societies are incurable, and patriotic tax-payers will be invited to cover the lost investments of American corporations.

Those of us who continue to argue the inherent insanity of it all do have to wonder at our own sanity. Why do we even try to speak out in the face of such converging pressures from opposite sides of the global village? Maybe it all comes down to sharing the conviction of an exhausted but determined Indian.

> I have no doubt such words have little virtue, and less force, where our rulers are concerned, and we invite their contempt, if not their wrath. But that's a risk we must accept, for it's our agony that makes us people, and it's our voice which makes us human. The rest is a question of faith in an essentially faithless world. (Darshan Singh Maini, 'Oh Delhi, Delhi!', in "Voices from a Scarred City", Delhi: Lokayan, 1985.)

## AEI

ALTERNATIVE ENERGY INDUSTRIES (AEI), pioneer in the manufacture of solid fuel from agricultural wastes on a commercial scale in India, is doubling its capacity to 28,000 tonnes per annum. The project, estimated to cost about Rs 116 lakh, is to be financed partly by the issue of 8.50 lakh equity shares of Rs 10 each at par. Out of the issue, 1.90 lakh shares have been reserved for preferential allotment to non-residents of Indian origin on repatriation basis. The subscription list for non-residents opened on May 29 and for the Indian public it will open on June 12. The plant located at Pondicherry went into production in January last and has attained rated capacity. The plant is equipped mainly with Swiss machines supplied by Fred Hausmann AG. The company markets its product under the brand name 'AGBURN'. The Madras-based Parry and Company, marketing agent, has assured sales of the company's entire production. The company hopes to achieve a turnover of Rs 80 lakh for the year ending October 1985 and show a cash surplus after providing for depreciation. Turnover in 1985-86 is expected to be around Rs two crore with a pre-tax profit of Rs 60 lakh. The issue is managed by H B Financial Consultants. New Delhi.

# Bank of Madura Limited

## Statement of the Chairman **Shri S Kumarasundaram** at the forty second Annual General Meeting of members of Bank of Madura Ltd held at Madurai on May 25, 1985.

Ladies and Gentlemen,

I EXTEND you a cordial welcome to this Forty Second Annual General Meeting of members of the Bank, the second in my tenure as Chairman.

The Directors' Report, the audited accounts of the Bank and the Auditors' Report for the year ended December 31, 1984 have already been circulated to you. With your permission I shall take them as read.

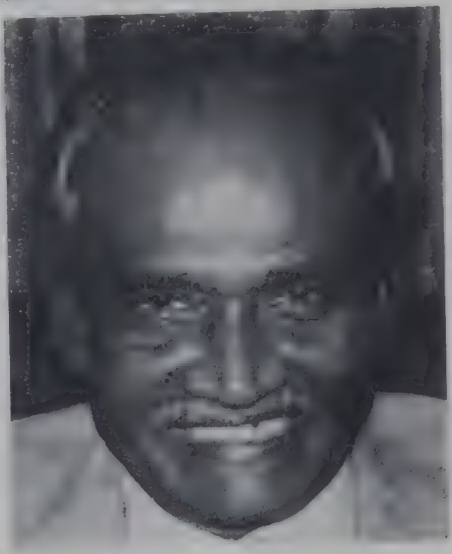
### BANK'S WORKING DURING 1984

After years of rapid growth, 1984 was a year of stability for the Bank of Madura. Aggregate deposits of the Bank stood at Rs 187 crores as at December 31, 1984 and advances at Rs 136 crores. Deposits and advances showed modest growth rates of 11% and 7% respectively over the previous year. In compliance of statutory requirements, the Bank's investments in Government and Government guaranteed securities were stepped up. Advances in support of priority sector and export activities expanded at a somewhat faster rate than general advances.

The Bank's annual accounts, after allowing all necessary provisions, disclosed a net profit of Rs 51 lakhs for the year 1984 as against Rs 41 lakhs for 1983. The Directors of the Bank have recommended a dividend of 12% for the year under review, which absorbs about a fifth of the net profit earned. As the members are aware, one of the regulatory instruments wielded by the Reserve Bank, relates to dividend levels in a bank. This particular regulation stems from a concern for augmenting the equity funds of the banks through ploughback of earnings. Though there can be more than one view in this matter, your Directors cannot but defer to the Reserve Bank's judgement. The dividend rate of 12% may not seem attractive to some of our members, but on behalf of your Directors I should perhaps point out that the stability in our dividend rate is a measure of the Bank's strength. This is not to say that members' claims for a higher dividend distribution will remain unattended should our earnings show further improvement.

### BANK PROFITS

Banking, whether in India or abroad, has not been a high-profit industry but comparing its position with our industries, returns to shareholders tend to be much less unstable. In India, bank profits have been unduly depressed for many years, a consequence of the regulatory environment in which the banks have to operate and the relatively high wage levels prevailing in the industry. The regulatory environment has three aspects, first a detailed prescription of interest rates on deposits, secondly a still more detailed prescription with respect to lending rates and thirdly a system of allocation of the banking funds on the one hand for priority sector and developmental activities, and on the other, prescriptions as to the amount of cash holdings with the Reserve Bank of India itself.



**S. Kumarasundaram**
Chairman

Salaries and other perquisites payable to employees in the industry are indexed and are inflation-prone. The same holds good for much of the remaining establishment costs, such as premises, stationery and telephones. Each round of inflation leaves the banks' position weaker. Banks, however, do not go entirely uncompensated by inflation. In this respect, the private banks tended to receive less of the fall-outs from inflation and therefore more adversely affected by the cost and price inflation than the Government owned banks.

### PRIVATE BANKS

There was a time when, barring the State Bank of India group, the banks were simply classified on the basis of their standing in terms of the Banking statutes. Though this classification continues to be valid in the eyes of the Reserve Bank of India, lately a less scientific and an ownership-based distinction is being promoted in the minds of the public. The widespread practice of classifying banks as between those under private or public ownership and placing the latter on a higher pedestal does disservice to private banks, many of whom have an established standing in the country.

Private banks in India have been under a handicap *vis-a-vis* Government banks. For one thing they have to mobilise their deposits in a hard way as bulk deposits as well as low-cost deposits are not easily available to them. In particular, the avenues for Government and Government associated deposits remain closed to them. There is some evidence that the transaction balances of some of the Government entities have been increasing in recent years. Whether this is necessarily a good thing or not, the fact remains that private banks are being placed at a disadvantage to secure their due share of deposits.

Credit administration for private banks has also become an expensive exercise because their lending is mostly to small business and small-scale industries.

As people engaged in collection of small deposits and as agencies primarily doing business with small entities, both with a considerable social content, their role in the Indian banking scene though significant, goes unnoticed.

Private banks are as much under an obligation to observe the official directives whether it be subscription to Government securities or the financing of priority sector activities. Operational data of private banks would confirm that their progress in this respect is quite creditable. In the case of public sector banks the costs of their social banking activities in principle could be passed on to the Government. These banks which have access to bulk deposits or have outlets for deploying bulk funds have a lower per unit cost of operation and can also comply with the social ratios with less cost to themselves than a typical private bank.

### PRODUCTIVITY AND COST EFFECTIVENESS

Given the environment governing the

banking industry, and in particular the private banks, I must hasten to assure the members that Bank of Madura is already well set to take action on several fronts to safeguard its operational viability. The key elements of action here are: accent on increased earnings on the Bank's funds and non-funds business, creation of profit-consciousness amongst the managers, competitive provision of banking and financial services, and securing higher staff productivity and cost effectiveness (as distinct from pure cost-cutting programmes).

An immediate task is to create a general awareness about profitability in the Bank. The average yield on the Bank's advances is not as high as it should be and certain categories of banking services have not been charged in line with costs incurred. As the areas of manoeuvrability are limited due to controls on lending rates, profit-consciousness is being instilled at all levels while deploying Bank's funds and services.

The Bank has launched three new deposit schemes namely Madura Pension Scheme, People's Deposit Scheme and Madura Gift Certificate Scheme. The first two schemes have been introduced in order to provide a support during the later part of life even for those who are not covered under any approved pension scheme and who do not earn any regular income.

The Bank is aware of the developments taking place in the Indian Financial Market. As a commercial banking institution, the Bank sees opportunities for providing certain new financial services complementary to its existing activities. Towards realising some of these opportunities the Bank's Board has given its approval for setting up a Financial Services Division.

Computerisation in a rudimentary way, is already in use in the Bank. We are making certain planned moves in this direction, and by the end of 1985, on completion of first phase of computerisation, the Bank is expected to have a stronger Management Information System and make some definitive progress in branch level mechanisation. Computerisation however involves considerable short-term costs. By the same token, it is not necessarily a cost-saving aid. But it is an essential tool of modern management, offering cost-effectiveness and significant long-term gains in productivity.

Before I conclude I must acknowledge my indebtedness to my colleagues on the Board for the help I have been receiving from them. Chairmanship of a Board particularly Executive Chairmanship could place the incumbent in a position of isolation. In this past one year of my Chairmanship the fact that I had never for a moment felt this isolation was a measure of the quality of the Board participation in the policy making process in the Bank and the counsel that I could so readily obtain from my colleagues on the Board.

I wish to express my gratitude on behalf of my colleagues on the Board and on my own behalf, to the authorities in the Reserve Bank of India for their advice and cooperation. I also wish to thank the staff and officers of the Bank for the many kind gestures and the cooperation I have received from them in an unstinted measure. Last but not the least, I wish to thank you all, the esteemed shareholders, for your continued trust and confidence.

Thanking you once again.

# Bank of Madura Ltd

758, Anna Salai, Madras 600 002

## ABRIDGED BALANCE SHEET AS AT 31st DECEMBER 1984

| Previous Year Rs. | Capital & Liabilities | 31-12-1984 Rs. | Previous Year Rs. | Property & Assets | 31-12-1984 Rs. |
|---|---|---|---|---|---|
| 78,95,579 | 1 Paid up Capital | 79,36,367 | 39,26,44,677 | 1 Cash and Bank Balances | 33,26,01,152 |

# On the Political Structure of a Liberal Democracy

**Mrinal Datta Chaudhuri**

THERE is a major difficulty in having a serious discussion around important political concepts. The difficulty stems from the fact that these concepts have constantly been used and abused over a long period of time in the battle-grounds of actual political conflicts all over the world. Such a process necessarily simplifies, obliterates and emasculates the meanings of complex, many-sided concepts. At the end, what often remain are certain vague associations of ideas. Such associations of ideas are then mercilessly exploited by political combatants in creating 'brand-names' for the packages they want to sell or in attacking the opponents they want to fight. Thus we have in the world today some extremely illiberal regimes managed by rigid self-perpetuating oligarchies being labelled as 'democratic', and some extremely inegalitarian political groups calling themselves 'socialist'. 'Fascism', of course, has plainly become a term of abuse.

In such a situation, understandably, social scientists associate names of important social thinkers with specific concepts. The reason is that the serious intellectual contributions of such people are available in written form and it is possible to examine and analyse these writings in preparing a proper agenda for discussion. This would, one hopes, bring about a measure of discipline in the intellectual discourse around these concepts.

Liberal democrats all over the world almost invariably invoke the name of John Stuart Mill in defining the system of their beliefs. More than any one else in the history of social thought, John Stuart Mill embodied in his works—in economics, moral philosophy and political thought—the essential ingredients of liberal values, which must constitute the core of a democratic society. His book on Political Economy and his major essays like 'On Liberty' and 'On Representative Government' still remain definitive works on the subjects concerned. But the importance of Mill to liberal social scientists lies in the fact that he not only wrote on the conceptual categories of liberal values and democratic institutions with great analytical ability and insight but he was also an insightful commentator on the various reform movements which took place at his time in England. Since that was the time when the British political institutions were evolving as a model of political democracy to be initiated by many nations in subsequent periods, the commentaries from a thinker of Mills stature on contemporary events become invaluable to students of liberalism. We have in Mill's works not only analytical writings on abstract principles but also illustrations of how to apply the logic and the principles of liberalism in designing as well as reforming an actual social system. Therefore it is not surprising that John Stuart Mill stands out as the most important source of inspiration for people who believe in liberal democracy.

The system of thought which John Stuart Mill created also has suffered due to simplifications.[1] Some of the crucial concerns of Mill in defining the structure of a liberal democracy have been all but forgotten by latter-day liberals, although these remain equally relevant today. For example, most people would be surprised if they were told that Mill opposed the introduction of the secret ballot in England or that he had serious reservations about the basic principle of universal suffrage, i e, one-man-one-vote. These reservations arose because, unlike most liberals today, Mill did not believe that the formation of representative government through free and fair election would always ensure enlightened liberalism. Mill was afraid that without many carefully thought-out checks and balances in the system, a simple application of the first principle of liberalism, i e, the formation of representative government through competitive politics might produce unenlightened and illiberal outcomes.

Mill opposed secrecy in voting because he believed that in exercising his political choice a citizen is required to act as an altruistic, moral person and he should be required to do so openly in the eye of everybody else. Here Mill was making a fundamental distinction between individual choice in the context of a free market economy and individual choice in the context of a free political system. In the former case, there is little justification for asking a consumer to abandon the privacy surrounding his likes and dislikes. But in the latter case, since his action affects the well-being of others, he should be made morally accountable to others. The strength of Mill's argument becomes obvious when one asks whether the voting records of our parliamentarians on every single issue of legislative action should be made public or not. There is a strong case for making the public actions of a legislator known to the voters in his constituency.[2] Of course, Mill was aware of the argument in favour of the secret ballot, namely, avoidance of intimidation, but on balance he felt that the principle of the openness of political action was more important and needed to be upheld.

## Two Routes

If, unlike private consumers' choice in the economic sphere, political choice is supposed to be a moral act to be exercised in an altruistic manner, how does one try to ensure it by suitably designing the constitution of a liberal democracy?[3] There are two possible routes: one, by examining the credentials of individuals with respect to their ability to act as altruistic moral agents, and two, by creating a number of safeguards in the actual working of a democratic system if necessary by compromising the first principle of liberalism.

The first route takes one away from the principle of one-man-one-vote. Here Mill was against restricting the franchise by disqualifying some citizens from exercising their voting rights.[4] He was in favour of tilting the balance of the electorate by giving multiple votes to 'qualified' people. Here education was an obvious candidate as a screening device.[5] There could be other indicators like sex, occupation, property ownership, etc. Luckily for social scientists multivariate statistical analysis was not developed in those days. Otherwise, there could have been a surfeit of quantitative research with variance-covariance matrices to determine the moral ability with the help of other statistics. The history of democratic experience during the last hundred years or more shows clearly that the uneducated (or for that matter any other socio-economic category of people) are not less able to act as moral agents than educated citizens.

This takes us to the second route, namely to design adequate safeguards in the working of the system. Much has been written as well as experimented with during the last hundred years. In this brief essay, we shall take up only one suggestion of John Stuart Mill. It relates to the reservation of seats in the Parliament for certain important minority groups. Here again the question of reservations for minority groups applies not only to legislatures but also to jobs, schools, etc. As everyone knows these constitute some of the most important problems faced by all unequal, plural societies today. But here we shall take up the question of political representation only, because it brings out an important problem of political formations in a plural society.

Mill said. " . . . the principle of universal suffrage requires that, as far as is consistent with practicability, every minority in the constituency should be represented by a minority in the representative body; and a mode of voting which does not keep this object in view is contrary to popular government; it does not *sum up the opinion of* the community correctly"[6] (italics added). He provided an example of this situation by saying, "In France, for example, it is probable that the Protestants do not form the numerical majority of any constituency. If the politics, therefore, of the moment were to turn on any question specially interesting them as Protestant, they would be entirely unpresented".[7]

Mill initiated a lively discussion around the 'democratic' principle that the minority should be represented by a minority. His own proposals for electoral reforms suitable for England at that time differed from those formulated by others like James Garth Marshall. In this brief essay, it is not necessary to go into the merits of those different proposals for electoral reforms. What concerns us is the implication of this principle for competitive politics in a liberal framework.

If the purpose is to evolve an electoral system in which the correct opinion of a community is to be summed up and represented by a member of the same community, then that community must be allowed to have a political formation along communal lines. Because, as Mill correctly pointed out, the exercise of political and electoral rights is not just a once-for-all event at the time of elections but an important instrument of moral and intellectual training.[8] Behind the exercise of political rights there has to be a continuing process of discussion, debate and sharpening of issues among the members of the community. If the Protestant citizens of France think of themselves in an important way as Protestants and perceive a commonality of interest in the political sphere among themselves, then the only way they can express it properly in a framework of competitive politics is by organising themselves as a political group. Therefore, the logic of Mill's democratic principle of minority representation by the minority would take us to the position where they should be encouraged to form political parties or political pressure groups in a system of competitive politics.

But then the question arises as to whether this principle of political formation should be applied to all communities constituting the society. If it were to be so, the nature of political competition for seats in the legislature will essentially highlight the conflicts of interest among the organised interest groups formed along communal lines. Should a liberal in the tradition of John Stuart Mill welcome such a proposal for a liberal democracy? In such a situation he should be worried about destroying another important requirement of an enlightened liberal democracy postulated by Mill: It is that in exercising his choice a voter should try to act as far as possible as an altruistic moral agent. If he is made to give up secrecy in order to discourage him from acting according to his narrow selfish interests, how much better he will be if he is cornered into acting essentially as a member of an ethnic or religious community? Mill's principal aim in advocating an open system was to prevent the representative government formed through competitive politics from becoming essentially a bargaining equilibrium of narrow interest groups. Party formation along ethnic or religious lines would certainly contribute towards achieving that unenlightened outcome.

This dilemma posed by the seemingly conflicting objectives of a liberal democracy cannot be resolved without bringing in some demographic facts about the nature of the plural society. If the society consists of a large number of religious or ethnic groups, each of relatively small size the problem of minority representation loses much of its meaning. In such a situation there is no danger of majority rule bcoming the dictatorship of *the* majority community. However, there may be a situation, where several communities gang up against one particular group over any single issue. Since there is usually a multiplicity of issues and no single community is numerically dominant, each community can hope to have some bargaining leverage in a democratic framework.

The problem becomes serious if the plural society consists of one numerically dominant community and one or more numerically small ethnic or religious groups. Bangladesh, India, Israel, Malaysia, Philippines and Sri Lanka are obvious examples of such Nation States. In each of these countries at some time or other fears have been expressed by the members of certain minority communities that the majority rule threatens some rights considered important by them. Often, the intensity with which many members of a minority community have shared this belief has made the orderly working of the plural society rather difficult. Liberal solutions to these difficult problems were not always sought or found. The purpose of this brief article is not to examine the anatomy of these communal conflicts, but to analyse the implications of liberal values for the political development of these societies.

The success of a liberal democracy depends on the ability of its citizenry to act in the political sphere by and large as altruistic moral agents and not according to their selfish or sectarian interests. If they fail to do so the outcome of a democratic process will be a short-sighted bargaining equilibruim of dominant interest groups, who have neither the ability nor the interest in preserving and furthering the liberal content of the social framework. On the other hand, certain important minority groups should be given the freedom of association necessary for ensuring a meaningful minority representation in the legislative bodies. This means that sectarian politics should not only be allowed but also be encouraged to develop among these minority groups. Otherwise, the democratic process might produce a dictatorship of the majority community.

This brings out a certain kind of assymmetry in the required political behaviour of different groups in a plural society. If the minorities do not behave in a sectarian way, the liberal content of society cannot be ensured. But if the majority community tries to achieve sectarian goals, they will end up in creating an illiberal regime like a theocratic state. Political history of Malayasia and Israel in the recent period illustrates the dangers of this outcome.

Another way of stating this proposition is that a liberal democracy cannot afford to accommodate or tolerate the phenomenon of 'backlash'. Competitive politics has the inevitable tendency of generating a heighten ed consciousness of conflicts, potential o actual. If active political formations exist i case of certain minority communities the will inevitably at times threaten the interest of the majority community. A real test fo a liberal democracy in a plural society is th ability of the majority community to resis the temptation of fighting back with th same weapons. It seems, at present Sri Lank is going through these difficult tests. Th polycentric structure of the Hindu societ along with its caste and regional differentiations makes the aggregation of the majority backlash somewhat difficult in India Nonetheless, there are several danger signal clearly discernible in the Indian politica scene today.

## Notes

1 Karl Marx, perhaps, is the worst sufferer i the hands of simplifiers. Today a larg number of Marxists think of Marx as a theorist of a two-class society propelled by simpl forces of economic determinism.

2 Mill wrote, "A Member of Parliament however secure against misleading influences from without, would often promote his private interest by voting wrong; and the chief security against this violation of his trust, is the publicity of his vote, and the effect on the minds of the opinion which will be formed of his conduct by other people" in "Thoughts on Parliamentary Reform", 1859.

3 Some Founding Fathers of the American Republic like Hamilton and Madison showed concerns about the possibilities of a political democracy becoming illiberal and unenlightened. They wrote profusely on the necessary corrective measures.

4 Mill wrote "The possession and the exercise of political and among others electoral rights, is one of the chief instruments both of moral and of intellectual training for the popular mind; and all governments must be regarded as extremely imperfect, until everyone who is required to obey laws, has a voice or the prospect of a voice in their enactment and administration" in "Thoughts on Parliamentary Reform", 1859.

5 Mill found the pre-requisites of the Oxford University entrance test to be a good indicator of the moral maturity of a citizen.

6 Ibid.

7 Ibid.

8 This has implication for the entire gamut of activities leading to the election of a legislator. Mill would have disapproved of the prevailing Indian practice, where the "high command" of each party nominates its candidate for each constituency a few weeks before the polling day. A citizen is then asked to chose one among them. An adequate moral and intellectual training for the citizenry would certainly require a more participatory system.

REVIEW

# From Kin to Class

R S Sharma

**From Lineage to State** by Romila Thapar; Oxford University Press, Bombay, 1984; pp 189 + one map, Rs 110.

THE work starts with an excellent summary and critique of the current anthropological theories regarding the origin of the State. In the process Romila Thapar explains the lineage theory in which elders enjoy authority and better access to resources at the cost of the juniors because of their kin-based seniority. She also clarifies the concept of the householding economy, which means a large, self-sufficient household comprising several small houses, all belonging to the same kin group. The head of the household enjoys power and authority over its members, and also employs labourers not belonging to the kin. It is Thapar's thesis that the Vedic communities, which practised reciprocity and redistribution, were organised on the basis of lineage and householding economy and the development of these institutions led to the formation of the State. The State, on the basis of Lawrence Krader, is understood as a political authority operating with its functionaries within a territory, deriving its income on an impersonal basis, and integrating social segments with different ritual roles and economic functions (p 11).

The problem of transition from classless and stateless societies to class-based and state-based societies is very complex. Anthropologists have tried to tackle it in the context of Black Africa and Latin America. Some work relates to tribal India in modern times. A similar exercise in respect of ancient India is made doubly difficult by the intractable and fragmentary nature of the sources and the inadequacy of the generalised anthropological findings. Vedicists and other scholars including K P Jayswal and U N Ghoshal have referred to the tribal, kin-based character of Vedic institutions. Some others have stressed the pre-class and pre-State nature of Vedic society and highlighted the tribal character of *jana, vis, grama* and *vrata* together with that of the Vedic assemblies. But Romila Thapar's search for the operative kin group at a lower level has materially advanced this argument further. In the context of Vedic society she finds the term 'tribe' to be imprecise and inadequate. She considers *sabha, samiti, vidatha, parishad*, etc, to be clan gatherings. More importantly, she uses the concept of 'lineage' to explain the nature of society in Vedic times and its change-over to class and State society in the middle Ganga plains around 500 BC. In doing so the ecological and archaeological evidence is put to good use. Her study leaves no doubt that a major portion of the Vedic age had its archaeological counterpart in the western Ganga plains. However she bases her argument mainly on the Vedic and Pali texts. She shows an acute awareness of the current anthropological concerns with the problem of transition, particularly in the writings of French Marxists on the subject. In her view lineage, which is different from the egalitarian band, plays a dominant role in determining access to economic resources, power and status; this is true of the predominantly pastoral society of Rigvedic times and the agricultural society of the later Vedic age. No significant agrarian changes took place between the second millennium BC and c 500 BC. Although iron was known, its use was limited to weapons. The lineage distinction appeared in the *Rigveda* in the form of that between the *rajanya* and the *vis* and it continued in later Vedic texts. But the relationship between the two became more distant in later Vedic times (p 32). The *rajanya* represented the senior lineage and the *vis* the junior lineage. The place of the *rajanya* was taken by the kshatriya who represented power. The *vis* made prestations (payments of levies or a kind of forcible presentation) to the chief, who reallocated to the kinsmen the things that he received. However claims to sovereignty and increasing demands for prestations were justified through coronation rituals.

The development of the lineage system led to an 'arrested development of the State' in the west Ganga plains in later Vedic times. Though territory emerged as an important element and the raja enjoyed a high status and effective control, increase in resources through agriculture was "not sufficient to finance a state system". The destruction of wealth in the ritual placed severe limitations on chiefdoms and prevented easy transition to a State system (p 66). [We could add that cattle sacrifice hindered the progress of agriculture.] There developed several impersonal institutions round the kshatriya king who emerged as the head of the State because of the authority conferred on him by the senior lineage. The twelve *ratnins* or functionaries who took part in the 'royal' coronation 'remained essentially within the orbit' of the clan (p 60), though their existence shows 'the emergence of a group of non-kinsmen' (p 61). Lineages were so important that *janapadas* or territorial states were named after them. Apparently because of its inherent exploitative tendencies lineage led to the institutionalisation of the political leadership. Further, because of the principle of descent the kshatriyas and brahmanas emerged as separate varnas. The element of heredity in the varna system was derived from the lineage system. Those who view the varna as class or as a symbol of social status ignore the importance of lineage leading to its formation.

This bare outline may not do full justice to the various other ideas, insights and interpretations found in this study, which puts forward some original views on the nature of the *gana-samgha* of the Vrijis and distinguishes betwen the internal working of the monarchies and that of the *gana-samgha* in the middle Ganga plains. Romila Thapar rightly points out that in post-Vedic times the functioning of the sudra and not of slavery was the crucial variable. Her study is further enriched by a critical appraisal of historiography, both Buddhist and brahmanical, and by a keen perception of the role of the geographical factors in economic and social changes.

## NATURE OF PRE-CLASS SOCIETY

The nature of the pre-class and pre-State society is viewed in different ways. The French Marxist anthropologist Maurice Godelier talks of the nuclear family, the enlarged family, the clan and the tribe as kin-based units of consumption which could also coincide with production units. The Soviet ethnographers think of (i) the extended family (which is identical with the lineage system), (ii) patronymic community, (iii) late gens (or clan), (iv) primitive (heterogeneous) neighbouring community, (v) the fraternal family community, etc. These do not occur in any sequence and may exist simultaneously in pre-State societies. In their view the concept of 'military democracy', propounded by Engels in his pioneering work on the origin of the State, "fails to cover the whole of the period of transition to class society", for military hierarchical and obligarchical structures emerge in the process. Those who have not done field work are likely to pick up any of the models or think of some other on the basis of confrontation between their hypothesis and the empirical evidence.

In Romila Thapar's view the term 'lineage society' is 'perhaps more precise' than 'tribal society' (p 18) in the context of the Vedic society. She therefore uses it as a tool of analysis, which taken together with the 'householding economy' contains "a certain degree of hopefully creative speculation" (p 18). A few comments may be offered. The notion of kin is central to the tribe, clan and lineage. Of the three, the tribe is the largest and lineage the smallest kin unit. In between comes the clan. Both clan and lineage are descent-based either on the male or the female side. Descent in the first may be stipulated, but in the second it is true and remembered. In our view kin groups are not purely biological phenomena, but they are formed to obtain subsistence and make the group reproduce itself. Certain Vedic terms such as *gotra, vra, vraja, vrata,* etc, which connote kinship at a later stage, originally indicate groups of those who come together either for cattle herding or for 'booty production' through wars. *Vamsa* is rightly considered in this study as the equivalent of lineage. But the term does not occur in early Vedic texts, and later texts use it for the family tree of the kshatriyas and brahmanas. Nevertheless the basic idea that in a kin group chiefs, elders or seniors enjoy more access to resources and better claim to status and authority is true of many primitive societies. Privileges flow from age, skill and experience in procuring subsistence, ability to lead in wars and so on, but these are frozen and formalised on the basis of heredity. Eventually seniority based on genealogy is turned into that based on the ideology of patrilineal descent, and genealogical kinship converted into ideological kinship. Some Marxists equate the lineage system with relations of production in which seniors strengthen their position *via* booty, elite goods, redistribution, genealogical knowledge, and above all through control of exchange of women. Many of these have been discussed in this book, but the idea that the control of young men's marriage amounts to the control of labour force needs exploration. Claude Meillassoux and Emmanuel Terray hold that the seniors can perpetuate their supremacy only if they control the circulation of women and bride-prices. But the detailed description of Surya's marriage with the two Asvin brothers in the *Rigveda* does not support this generalisation. Similarly the well known marriages of Rama and Arjuna do not indicate that the elders enjoyed such a control, although they occasionally arranged marriages in the epics. In post-Vedic texts, the *arsha* and *asura* forms of marriage indicate bride-price comprising a pair of cow and bull, probably provided by the seniors. But such bridal gifts cannot be called 'elite' goods. On the other hand bride-price attests the importance of women, and marriage in the matrilineal context may mean exchange of men rather than that of women.

The concept of the lineage mode of production is based on the study of very few primitive societies; to make it more viable many stateless communities, including those in India, will have to be studied by the anthropologists. Lineage does not exist among the Mbutis in the Gongo region of Africa. In some primitive societies no chiefs are found, and in others they are elected not because of their lineage but because of their generosity. Hereditary chiefs appear in Vedic texts, which also indicate that a person was elected raja because of his physical and other personal qualities. Indra was chosen for the great coronation because he was "the most vigorous, the most strong, the most perfect, the best in carrying out any work". Even then many kin-based or 'lineage' societies show the distinction between its 'elder' and junior members. Kin groups or lineages generate genealogical inequality, but it is not the same as class inequality based on access to land (p 41) and its products. Kin-based differences may give rise to classes only in a productive economy. The surplus, over and above the subsistence needs of the cultivators, may not alone explain the rise of the class and the State, but its centrality cannot be ignored. Only in the agricultural society of later Vedic times the tribal chief appears as the eater of the settlers/cultivators (*visamatta*), i e, of their products. Although the context alters the meaning of a term, Vedic scholars may find it difficult to render *vis* either into lineage or junior lineage. Generally the term indicates clan (occasionally tribe) in the *Rigveda* and settlement or tribal cultivators in later Vedic texts. Originally a kin group, when the *vis* took to agriculture, it came to mean a house or a settlement. The analogy of *grama* is well known. But the *rajanya*, literally the kinsmen of the raja, may have been divided into junior and senior lines. How hierarchies in various lineages or kin groups were combined into the network of domination and exploitation called the State needs more research.

Polanyi's householding economy, equated by him with the patrilineal lineage (p 39), is applied to the later Vedic period. It presupposes the employment of labour outside the extended family circle, for which we have little evidence in Vedic texts. Sudras do appear as the most inferior group, but they are rightly considered as 'addenda' by Thapar; at best non-kin labour covered domestic servants and women slaves. A large household could be an intermediate economic unit between the clan control over land and its family possession. Its non-kin component could undermine the lineage system, but if the household meant the extended family (p 33) "the nature of its association with the lineage", which was a wider unit, may need some rethinking. Evidently a family needed extra labour only if it grabbed more land than it could manage. Such units of production became important in post-Vedic times, when the vaisyas or the *gahapatis* became the principal tax-payers.

The 'lineage'-varna continuum cannot be denied. Hutton and others held that caste endogamy was derived from tribe endogamy and *gotra* exogamy from clan exogamy. Recently the idea of the tribe-caste continuum has been elaborated by Indian anthropologists. But the continuity of lineage was overshadowed by the social division of labour on which the varnas were erected. Division of functions paved the way for the rise of new lineages. In post-Vedic times priests and warriors tried to congeal their surplus consuming privileges by reinforcing heredity and fabricating family trees. The author rightly holds that the brahmanas comprised several non-Vedic elements. This is also true of the kshatriyas, who understood the ideological and validitary value of the lineage. In the past both the raja and the *vis* practised agriculture. Gradually the vaisyas were compelled to stick to it. How some families monopolised war and tax-collection, others adopted religion and the receipt of gifts, and the two together pushed the majority to producing and paying has to be solved satisfactorily.

Many other valuable points made in Romila Thapar's book deserve attention. She has undoubtedly produced a thoughtful and stimulating study, full of fresh ideas. Analytical and interpretative in the main, the book also supplies new pieces of information. It provides several leads for further inquiry. As a significant contribution to study of ancient Indian polity and society, it is indispensable reading not only for ancient historians but also for those who are interested in the problem of transition from kin-based societies to class-based and state-based societies.

# The Bhopal Tragedy: A Middle Word

**Pushpa M Bhargava**

*The Bhopal tragedy, with few parallels in human history, was totally avoidable. It has pointed out serious weaknesses in policies and their execution. It has also brought to the fore the ugly truth as to how little premium we place on human life—specially of those who do not belong to the privileged class.*

*The last word on the Bhopal tragedy has not been written, nor will it be written for long. The epilogue might be longer than the drama. It is incredible that with our infrastructure, we still do not have a complete list of all those who died as a result of the Bhopal tragedy. The estiamtes vary from less than 1,500 (the official figures) to 30,000 (unofficial figures).*

*What is particularly tragic is the lack of information from those who have it, or* should *have had it. One would have like to see an objectively written, comprehensive, reliable and authentic white paper on the tragedy. It is not the lack of expertise but the lack of a culture of concern, of thoroughness, of efficiency, all round, which generates such tragedies—and then sustains them, instead of ameliorating them, through time. The blame does not lie entirely with anyone in particular, but with the system that sustains instead of closing the schism between the privileged and the unprivileged that has been, and continues to be, the bane of our society.*

IT is said that some people are born great; some achieve greatness, and on some greatness is thrust. The same is, perhaps, true of accidents. On some accidents, man has no control—such as a hit by a meteorite or lightning, or an earthquake, storm or landslide. Some accidents we bring upon ourselves, such as accidents due to driving under the influence of liquor. And, some accidents are thrust upon us—like the Bhopal tragedy.

## FACTS

Methyl isocyanate (MIC), $CH_3NCO$, is a liquid at temperatures obtained in air-conditioned rooms, slightly lighter than water (specific gravity 0.96); its boiling point is 39°C. In the gaseous form, it is heavier than air. It is an extremely reactive substance, generating methylamine in the presence of water; one mole of methylamine reacts with another mole of MIC to give dimethyl urea with the generation of heat. Many of its other reactions have already been described often and I shall not refer to them. It has, however, not been adequately recognised that isocyanates, in general, can react with carboxylic acids to generate a peptide bond with the liberation of carbon dioxide according to the following scheme:

$$RNCO + R\ \ COOH \rightarrow RNHCOOCOR \rightarrow RNHCOR' + CO_2$$

Under the influence of a large number of metals and other catalysts, MIC enters a violent exothermic polymerisation reaction. On heating and burning, it generates several toxic decomposition products, such as nitrogen oxides, hydrocyanic acid (HCN) and carbon monoxide.

From what I have said above, two possibilities which have not been so far adequately considered, should be taken into account in relation to the Bhopal tragedy:

(a) MIC could react with the free carboxyl group of proteins (the carboxyl group at the terminal or the free carboxyl group of an interior aspartic or glutamic acid). If such a reaction occurs with an enzyme such as DNA polymerase, one can conceive the possibility that the altered enzyme could lead to an error in the replication of DNA which could, in turn, lead to a mutation-like event. Such an event could lead to a teratogenic effect—that is, an abnormal development resulting in a malformation in the embryo.

(b) HCN gas *could* have been liberated during the accident. Unlike MIC, HCN is stable and could, therefore, last for long in the environment.

## TOXICOLOGY

Again, much has been said in this regard; so, let me restate only the more important features briefly. MIC has a strong irritant effect on tissues such as skin. It leads to suffocation; therefore, the chances of damage and death would increase if one runs when MIC is present in the atmosphere as, during running, the oxygen requirement increases. An acute exposure to MIC would lead to death. As regards the long term effects, a prominent effect is residual lung damage leading to progressive fibrosis and the consequent loss of function. It can lead to keratitis and corneal ulcers which, in turn, could cause opacity of the cornea. MIC is a potent sensitising agent; just 0.02 parts per million in the atmosphere could do the damage in this regard. This means that one could erupt into an allergic response on a second exposure to not only MIC but also to other isocyanates, on account of possible immunological cross reactivity between MIC and other isocyanates. Isocyanates are commonly used, industrially important compounds and one may find them even in materials such as textiles.

The hypoxia caused by MIC could lead to brain damage in the progeny in the case of pregnant mothers.

## WHAT IS NOT KNOWN

No cytogenetic test data is available for MIC or related compounds such as dimethyl urea or phenylmethyl urea. No carcinogenic data or reliable mutagenic data is available for MIC. The only related chemical tested in this regard is methyl urea. It has been shown to be marginally positive in sister chromatid exchange (SIE) experiments, but negative for aberration induction in Chinese Hamster cells *in vitro*. No work appears to have been done in which the effect of MIC has been tested on various metabolic processes in cells grown in tissue culture or on plants.

It would obviously have been of importance to have obtained as much as possible of this missing information as quickly as would have been feasible, after the Bhopal tragedy. Unfortunately, this was not done. I am not aware of any effort that might be underway even now, which is likely to lead to *reliable* information in regard to any of the above points.

## THE TRAGEDY

Just before midnight on December 2, 1984, the second shift workers at the MIC plant in Bhopal noticed the temperature rising in tank E-610 at the factory. It appears that the control room had even earlier noticed malfunctioning of this tank and that it was for this reason that tank 611 was used for feeding the Sevin plant (MIC was being used at the plant in Bhopal for making the pesticide, Sevin). The senior plant officials were informed of the above rise in temperature and a mention of suspected MIC leakage made in the log book. The senior officials of Union Carbide India Limited (UCIL), including the Manager, were on the site. At 11.30 pm, even though the developments were, perhaps, getting out of control, and the possibility of even an explosion must have been no doubt envisaged, no efforts were made to alert the people.

What happened subsequently is now history, well known and often repeated. Whatever leaked out of the tank that black night of the December 2-3, 1984, led to the death of, perhaps, as many as 10,000 people. This figure is based on an evaluation of first-hand reports of many of the people who visited the site after the tragedy and attempted to make a reliable estimate. Between twenty and fifty thousand people might have been affected seriously and as many as two-and-a-half lakhs affected at least marginally. The total population of Bhopal is about one million.

### Why the Tragedy?: A Case of Negligence and Callousness

Let us first look at some specific issues.

(1) As already mentioned, MIC is an extremely reactive substance. It is known to polymerise on storage for long periods. Therefore, any stored MIC must be monitored constantly. Tank No 610 at Bhopal was filled with MIC three months prior to the accident. It would appear that the tank was not monitored adequately during this period. There are indications that certain meters in the control panel which was supposed to monitor the MIC tank and which could have given early warning of any malfunction, were not functioning.

(2) The chances are that the build-up of the reaction—whatever it was that led to the accident—was aided by lack of chilling of the tank. The chilling unit appears to have been switched off as an economy measure.

(3) The primary saftey system at Bhopal consisted of a caustic soda scrubber; alkalis such as caustic soda would neutralise MIC. However, at the time of the accident, the vent line leading into the relief valve vent feeder was being washed and, therefore, was unusable. This means that no MIC could flow into the scrubber. Further, the motors that pump caustic soda into the vent gas scrubber (VGS) were down. Apparently, no stand-by system existed which would have allowed caustic soda to flow into the scrubber. It would seem that, for an emergency, a stand-by system using passive flow under normal gravity could have been easily installed.

(4) Even if all had worked well with the above mentioned safety system, it turns out that it was heavily under-designed with respect to the quantity of the gas stored. The system could take care of only 5 tons of MIC during the first half hour, and only one ton every subsequent half hour. The tank had 40 tons of MIC.

(5) In the safety system existing at the Bhopal factory, any toxic gas which remained unneutralised following passage through the VGS, would go to the flare tower for burning. On the day of the accident the line connecting the VGS and the flare tower was down for repairs. It had suffered extensive corrosion due to constant neglect, and there was no back-up parallel line; installation of such a parallel line would not have required either major work or investment.

(6) The staff available was not enough to ensure adequate safety. In the words of Delhi Science Forum, "In the company's economy drive, measures of retrenchment, incentives for voluntary retirement and policy on work-load manning and training have been prominent during the last two years. A large number of skilled and well trained personnel have left the firm. The company has been giving incentives for voluntary retirement, offering additional benefits ranging from Rs 12,000 to 25,000 for the middle-level technical manpower. The company also has been taking economy measures in respect of manning of the plant at the lower levels. For the MIC plant where there used to be earlier 8-9 operators, the company had at the time of accident, reduced the strength to five with one extra in emergency. This resulted not only in increased workload for the remaining personnel but also stationing of untrained personnel in various crucial sections of the plant. The MIC and CO plants, separated by more than 100 feet, used to be supervised by two different production supervisors each specifically trained for their tasks. *Now* there is no separate production supervisor for the MIC plant. Instead, the CO plant supervisor is incharge of both the plants. This would have been unthinkable in the early phase of UCIL. The intensive training and evaluation programmes that were in vogue at the early phase have now been completely discarded. Also the fail-safe principle of having one additional person besides the minimum necessary at each station which had been dramatically emphasised while the plant was being set up, had been abandoned (e g, staff of two at the 15 feet wide control panel had been reduced to one). It is clear that the company's drive for making profits and effecting economies has been at the expense of safety and well being of its workers and that of the city's population."

(7) That the MIC plant at Bhopal was both obsolete and unsafe would be clear by comparison with the Union Carbide Plant in the United States. The two plants appear to have differed significantly in respect of instrumentation and the controls employed. The US plant has a computerised safety system, whereas in Bhopal most of the controls were manually monitored and operated. The US plant has a four-stage alarm system, whereas the Bhopal plant had only one manual back-up alarm system. Most important, the US plant does not use a system which, unlike in the case of Bhopal plant, would require the storage of MIC in large quantities; the MIC produced in the US plant is quickly converted to the end product. It is, therefore, not surprising that the Bhopal plant had been beset with accidents for a long period. Much has already been written about these earlier accidents; the warning implicit in these accidents appears to have been totally ignored not only by the UCIL but also by the other authorities concerned. Some responsible quarters have even indicated that the Bhopal plant was in fact obtained second-hand from the United States. Other reports say that Canada had earlier refused to locate this plant on its own territory.

But, no matter whether these apprehensions are true or not, it is quite clear that UCIL as well as all those concerned with granting permission to the UCIL to instal and locate this plant at Bhopal, and with the subsequent monitoring of the plant, are guilty of negligence, callousness, indifference and a lack of concern for the people.

### What Should and Could Have Been Done

If genuine concern for the people was an important ingredient of our policy towards multinationals, we would have never permitted UCIL to locate this plant *anywhere* in the country. Again, as the Delhi Science Forum report says, "[this incident has ] convincingly brought home once again, in extremely tragic form, the truth that multinational corporations operating in Third World countries pay scant attention even to technological imperatives for ensuring human safety, in contrast to the measure they adopt under the vigilant eyes of the people of Europe and the USA. The Bhopal accident starkly exemplifies the inherent tragedy to the logic of pursuing maximum profits at minimum costs, more so in Third World countries whose populations are considered expendable by MNCs."

This incident is also a sad reflection on the pesticide policy of the country. It has been pointed out as far back as some fifteen years ago by responsible and knowledgeable scientists that India should invest heavily in research on *biology*-based pesticides as they would, indeed, be the pesticides of the future. This was not done. On the other hand, much repetitive work on *chemistry*-based pesticides (in some cases, on those which we now know have not been permitted to be used elsewhere) was started and encouraged in the country; in addition, technologies were imported for manufacture of pesticides which are known to be hazardous to man and environment. The pesticide, Sevin (carbaryl), that was being made in the UCIL factory at Bhopal from MIC, is one of the most toxic pesticides known. In 1976, the Environmental Protection Agency of the USA placed it on the list of compounds that are "possibly too hazardous to man and environment". Sevin is highly toxic to mammals and is recognised as a human teratogen (teratogens are chemical substances that can lead to birth of malformed progeny) by a panel of the US Department of Health, Education and Welfare. Sevin is also known to be carcinogenic in tests on animals. Foreign agencies are known to have invited research organisations in our country in the past to work on substances such as chlorinated hydrocarbons which are extremely toxic (one may recall the Seveso accident in Italy in 1976 caused by leakage of dioxin, an extremely toxic substance which is a chlorinated hydrocarbon). Fortunately, many of these attempts did not bear fruit as we were vigilant. Why did we miss out on Sevin?

Even if, for any reason, UCIL had been permitted to manufacture Sevin, why was Sevin permitted to be manufactured by the process that was being used? Apparently, the Union Carbide in the US itself holds a patent for an alternative process in which phosgene issued to react with sodium-l-napthoxide, and the product is then reacted with methylamine. Although phosgene is poisonous too, it would not be as dangerous as the one using MIC, for phosgene is produced by a continuous process (unlike MIC) and, therefore, need not be stored in large quantities. Alternatively, MIC could have been *imported* in small containers as firms in Britain and France have been doing. According to the Delhi Science Forum report, a division of Ciba-Geigy Chemicals is the only company permitted to deal with MIC in Britain. Located two miles from Grimsby, a small town, it imports and stores the chemical in 45-gallon stainless steel drums. No more than 60 tons of the chemical is kept in stock at any one time. In France, a Union Carbide affiliate imports the chemical from the US in highly protected drums carrying 213 kilograms each; they must be handled separately and cannot be stacked together. The drums are stored in separate sheds equipped with water sprinklers which are automatically activated by gas detectors that set off an alarm in case the concentration in the atmosphere reaches a certain low level measured in one-hundredth or one-fiftieth of one part per million. What prevented us from doing the same?

Even if MIC *had* to be manufactured at Bhopal by the process presently employed, why was it necessary to store it, for the Union Carbide itself holds the patent for production of Sevin without storage of MIC: the process that it is using in its American plant? And, of course, if it *had* to be stored, why wasn't there enough staff, and why weren't the usual mandatory monitoring and other safety precautions taken?

Then, why were the people of Bhopal left so ill-informed? Why were they not told ahead of time what is known about the acute toxicity of MIC; what its long-term effects are; and what could *possibly* happen, for example, to pregnant mothers?

Why weren't they also told what we do not know—for example, the lack of information on the carcinogenicity and the teratogenicity of MIC?

Why wasn't there an emergency plan made out ahead of time for a possible accident, and announced at the time the factory was set up? With the toxicity of MIC so well known to experts (including those who must have cleared the MIC plant for being set up in Bhopal), why did not the UCIL or the state authorities—individually and collectively—work out a disaster or crisis management plan.

There are, similarly, questions one might ask pertaining to the events after the tragedy.

Why was there so much delay in the state government authorities moving in? They should have been the first to recognise the magnitude of the tragedy—and this should have been done while the sun was still not up. Why were all available media—radio, television, vehicles, loud speakers—not pressed into immediate service to tell people what had happened and to keep them informed? Every other broadcast from the All India Raio and Doordarshan should have been stopped immediately.

MIC is heavier than air. It would surely have been destroyed wherever it came in contact with water. But, there is no doubt that there would have been dry pockets and corners in the area around where, being heavier than air, it would have settled and not been destroyed. Why were these places not sought, and air samples collected from there. Today, in fact, one is not even sure whether it was MIC which did all the damage. *I* am certainly not sure of that. A WHO report, following a visit by one of their scientists to Bhopal between seventh and 13th December 1984, says that "there is no indication that the cloud consisted of anything but MIC" implying that till that time there was no positive evidence of the killer being partly or totally MIC. The same report, in fact, mentions that on heating and burning MIC would generate substances such as hydrogen cyanide; the report also refers to the finding of cyanide in blood and tissues of some of the "most severe cases" by Dr Daunderer of West Germany and his team, and says, in true scientific spirit, that this finding is unexpected and unexplained. Subsequent findings of Indian scientists and doctors have supported the above finding of the West German scientist. It seems to me incredible that we still do not know what it was that caused all the damage in Bhopal.

What is particularly tragic is that even today, people have not been made aware of all the facts we know. One would have, indeed, liked to have a statement from the authorities concerned, giving the state-of-art information on what we know, what we don't know, what the various possibilities are, and what is being done. It is most unfortunate that everything was kept so hush-hush. As was recently said in an article in one of our newspapers, "Right to information is a basic right. Information and knowledge are the single most important and crucial commodities in the world of today, and talk of democracy becomes a farce when they are denied to people." No suggestions were asked—not even from many scientists in the country who could have advised. Where suggestions were given, they were often ignored.

There hasn't even been an *assurance* from appropriate authorities that a review of all safety regulations in regard to hazardous material will be taken up and that it will be ensured that the country does not allow the marketing or testing of products prejudicial to its interests on the basis of world-wide evidence and local considerations. A statement from responsible quarters, *immediately* after the tragedy, saying that steps will be immediately taken to see that the stipulated safety regulations are implemented wherever required, would have helped raise the morale of people around the country. No definitive statement was issued in this regard. People have a right to know what is being done in this respect. We, indeed, underestimate people's ability to understand and appreciate facts and truth, and to take the right decisions when given the facts. On the other hand, we overestimate our own ability to fool them; ego seems to be an inescapable concomitant of power and authority in our country.

We needed a court order—the exhortations of scientists were not enough—to store a little of the MIC. Apparently, it has so far been made available only to one laboratory, that too only months after the tragedy, and to study only the chemistry of MIC, whereas the information we needed the most was on its biological effects. MIC should have been made available to a much wider range of laboratories and scientists who were keen to carry out various types of studies on it, and were capable of doing so. We should remember that a large number of laboratories in the country deal with many hazardous materials. HCN is a common laboratory reagent. And, we would have never been able to make useful vaccines if we could not, at some places, deal with viruses that are dangerous. Every pathological laboratory which identifies human pathogens runs a risk. However, one of the major objectives of training in science is to ensure that these risks, wherever they need to be taken, are minimised, if not eliminated. How many deaths occur every year in our homes on account of electrocution, or cooking gas? This does not mean that we stop using these amenities. It only means that we ought to train people better in regard to their usage. The staff of several laboratories in the country is responsible and quite capable of taking care of small amounts of MIC, observing the highest standards of safety. I dare say our own laboratory, Centre for Cellular and Molecular Biology, is one of them, yet we could not have any access to MIC. We could have done—indeed, we offered to do—

experiments using human peripheral blood lymphocytes *in vitro*, to look at sister chromatid exchange in them when exposed to MIC. We could have looked at the effect of MIC *in vivo* in animals, specially sister chromatid exchange in and blastogenic effect on lymphocytes. We could have studied the effect of MIC on various metabolic processes in cells grown in tissue culture. We have not been able to do any of these studies. In fact, I should be surprised if there is any biological experiment that is being done in the country on MIC which could be useful even in retrospect, whereas so many experiments *could* have been done. Indeed, if some of them were done early enough, we might have given people enough information to allow them to make their own decisions: for example, whether or not a pregnant woman should go in for an abortion. Speed at that time in organising scientific work was of the utmost concern. We totally missed out on that.

What prevented a country like India from having 500 full-time doctors put on the job of monitoring and taking care of the affected 2,50,000 people for a period of at least one year: one doctor for every 500 persons. There should have been a detailed medical follow up of *every* person in certain areas of Bhopal. One would, for example, like to know how many would come down with an allergic response. We have missed out on this too. What a marvellous opportunity lost for worthwhile scientific investigation which could have benefited the population of Bhopal in the years to come, for as I have already mentioned MIC is known to have long-term effects.

Knowing very well that MIC is a potent sensitiser so that a second exposure not only to MIC but to any related isocyanate could lead to an allergenic response, we have not even published anywhere, for public information, a list of all items in the preparation of which isocyanates are used or in which isocyanates could be expected to be present. We should have collected blood (for peripheral lymphocytes) from 5-10,000 persons immediately after the accident to see if there is any increased sister chromatid exchange in the cells. This work could have been easily organised in several laboratories around the country. A country which could do such an excellent job of organising the NAM or the Asiad could certainly do this. But, again, we failed.

And, of course, there is the haunting question to which we would all like to have an answer: Was it just an accident or was, somewhere, an act of deliberation involved? Is it true that when bewildered doctors at the Hamidia Hospital telephoned the UCIL when patient after patient started pouring in on that dreadful morning of December 3, the UCIL doctors told them that there was nothing to worry and advised them to give the patients symptomatic treatment?

And why was it necessary to permit the American lawyers to come and file suits on behalf of those affected? It is common knowledge that in such cases, those affected stand to gain extremely little. Anyone who is even cursorily familiar with the American legal set-up knows this well.

Couldn't we have frozen the entire UCIL assets in India and sealed them immediately after the incident?

## THE RESEARCH CONNECTION

Apparently, there is a research and development set up at the Union Carbide in Bhopal. What does it do? We surely have a right to know. According to the Delhi Science Forum report, the UCIL's R and D set up at Bhopal has entered into a collaborative agreement with the Union Carbide of the United States to synthesise new types of chemical structures, test them on tropical pests and supply the research data to the Union Carbide in the United States for an annual fee of US dollars 300,000. The research centre is, apparently, also receiving, on a regular basis, new chemical compounds from the parent company in the United States for which residue analyses and bio-efficacy studies are being conducted through various agricultural universities and institutes in the country. The results of these experiments are sent to the parent company in the United States. Our universities and institutes are probably not made aware of what the implications of these studies might be. Starved for research funds as they are, they generally welcome funding, specially if it is as liberal as must be the case in this instance, from any source. (This is unfortunate but a fact of life that we must try to understand.) Has anyone constantly kept a check on what the compounds tested are, and what the results have been? I doubt it. The possibility that some of these compounds could not have been tested in the parent country, cannot be ruled out. Past experience would even make it likely.

## CONCLUSION

It has been a tragedy with no parallel in human history—excepting, perhaps, Hiroshima and Nagasaki on different counts. It was totally avoidable. It has pointed out weaknesses in policy and their execution. It has brought to the fore the ugly truth as to how little premium we place on human life, specially of those who do not belong to the privileged class. I wonder what the situation would have been if the UCIL factory at Bhopal was surrounded by houses in which lived some of our most eminent businessmen, executives and senior government servants. I would predict there would have been no such accident. In fact, they would have never permitted the plant to be located there. Or they would have pushed it out.

Many of us seem to have forgotten the truth that a poor child of a poor mother is as dear—if anything at all, a little dearer—to her as the rich child of a rich mother is to the latter.

The last word about the Bhopal tragedy has not been written, nor will it be written for long. The epilogue might be longer than the drama, with all the tragico-comic trimmings of the country's celluloid of mass appeal. We seem to reduce everything to that state. Seriousness is confined to words alone; in action we drift. It is incredible that with our infrastructure, we still do not have a complete list of all those who died as a result of the Bhopal tragedy. The estimates vary from less than 1,500 (the official figures) to 30,000 (the unofficial figures). To whom will we, then, give compensation, supposing that we have a substantial amount to disperse, *a la* Union Carbide or anyone else? And will we be able to (*not*, can we) devise a machinery which would be fair, uncorrupt and humane?

What is particularly tragic is the lack of information from those who have it, or *should* have had it. One would have liked to see an objectively written, comprehensive, reliable and authentic white paper on it. It is not the lack of expertise but the lack of a culture of concern, of thoroughness, of efficiency, all round, which generates such tragedies—and then sustains them, instead of ameliorating them, through time. The blame does not lie entirely with anyone in particular—many in the country have indeed done a great deal to help, paying, as one might expect, a penalty at times. It lies with the system that sustains rather than close the schism between the privileged and the unprivileged that has been, and continues to be, the bane of our society.

[Most of my information is derived from published literature, from material made available to me by many friends and organisations from within the country and abroad—many of whom had visited Bhopal and spent some time there (they have included scientists, lawyers, doctors and others). I have liberally drawn on the excellent report of the Delhi Science Forum on the Bhopal Gas Tragedy in the preparation of this article, this report has substantiated a great deal of what has been said by many other reponsible individuals and organisations who had one thing in common—objectivity and concern. Yet, as information has been difficult to come by, even for those who have tried hard, I might have erred on certain counts. The only apology is that, if I have erred, it is not due to lack of effort or to any bias. This article is, indeed, not an indictment of anyone in particular; it is an indictment of many. It is an expression of sorrow, of concern and of anger, on the part of one who could not be of any use. It is my own indictment, as a common citizen of our country.]

# Rural Non-Farm Sector in Asia

## A Characterisation

Swapna Mukhopadhyay

*There have been some attempts to collate the quantitative information on the size and structure of the rural non-farm sector. However, there have been few systematic attempts to characterise or analyse its role in the developmental process. In fact, a lot of the conflicting evidence and controversies that are found in the literature regarding the rural non-farm sector arises precisely because of the lack of a clear definition and of an analytical framework characterising its nature and place in the economic system.*

*A large part of this confusion disappears if one analyses the components of the rural non-farm sector and realises that for all intents and purposes the sector has a rather sharply bimodal nature. The bifurcation is not so much along aggregated product lines, but more along production technology, linkage patterns and surplus generation.*

*Much of the controversy regarding the nature and dynamics of rural non-farm activities can be resolved if one allows for their essential heterogeneity within the sector. An attempt is made here to characterise a prototype Asian rural economy when a rural non-farm sector with its bimodal character is embedded in the system.*

## I

THE non-farm sector has come to acquire an importance of its own in discussions of the rural economy. Estimates of allocation of rural labour time in non-farm activities in the Asian region have been found to be strikingly high.[1] In rapidly growing East Asian countries like South Korea, the rate of growth of income generated in the rural non-farm sector has been very substantial. In surplus labour countries of South Asia like India and Bangladesh, this sector is absorbing a growing amount of human labour. In mainland China, where in spite of a lower land/man ratio, as compared to India, yield per unit of land is higher, the new economic policy is directed at massive rejuvenation of rural industries so as to absorb over two-fifths of the rural labour force in the non-farm sector in the near future.[2]

In each case the explanation of observed trend or the rationale behind official policy might be somewhat different from the other. In Korea, for instance, imperatives for reducing urban congestion along with the advent of development programmes like the rural Saemul Undong might have provided the major initiative for the choice of the location of small scale industries. In large parts of South Asia a conglomeration of factors like low rates of labour absorption in the modern industrial sector, over-crowding on land characterised by fragmentation of holdings and high population growth has resulted in a swelling in the supply of labour available for non-farm activities in the rural sector.[3] In China, estimates of trend in the productivity of agricultural labour in recent years suggest that labour productivity on land is rising but at a decreasing rate. Given her policy of strict regulation of internal migration, the only sensible way to counter this tendency would be to absorb extra rural labour outside the farm sector and/or to augment productivity on land by further infusion into agriculture of indigenous technology developed in the rural industrial sector—a phenomenon which has been China's forte in the development of her agriculture.[4] Notwithstanding the apparent diversity in the factors leading to the growth of the rural non-farm sector in different countries of the region, the importance of this sector is well recognised.

There have been some attempts to collate the quantitative information on the size and structure of the rural non-farm sector. However, there have been few systematic attempts to characterise or analyse its role in the developmental process. In fact a lot of the conflicting evidence and controversies that are found in the literature regarding the rural non-farm sector arises precisely because of the lack of a clear definition and of an analytical framework characterising its nature and place in the economic system.

One such controversy that can be located in the literature is the likely dynamics of the rural non-farm sector (RNS) as the economy develops. In one of the earliest characterisations of the rural economy incorporating the RNS, Hymer and Reanick stipulated a steady decline in the latter as development proceeds.[5] Others have refuted the thesis citing empirical evidence to the contrary.[6] It will be argued in this paper that a large part of the disagreement in this regard arises from the confusion regarding definitional matters and logical categories.[7]

A second source of controversy has been the impact of growth in rural non-farm activities (RNA) on income distribution. While the case for rural industries has often been forwarded with the plea that these correct distributional imbalances, there is micro evidence to suggest that the development of RNA promotes inequalities in rural income generation. Once again it can be shown that a large part of the confusion arises on account of the heterogeneous nature of RNA.

Countries at different stages of development have been seen to have similar percentages of work force employed in RNA. On the other hand countries with very different labour allocation patterns in the RNS can be deemed to be passing through a common phase of development. Perhaps as a result of this non-monotonicity, the characterisation of the developmental process in relation to RNA growth has not been very satisfactory.

As has been argued elsewhere, a large part of this confusion disappears if one analyses the components of the RNA sector and realises that for all intents and purposes the sector has a rather sharply bimodal nature. The bifurcation is not so much along aggregated product lines, but more along production technology, linkage patterns and surplus generation. The two broad prototypes of RNA are as follows:

(i) The RNA sub-sector I which comprises of products and/or activities exhibiting the following traits: enterprises run on more or less stable basis with an eye on surplus generation and growth, using primarily hired labour and a certain degree of technological sophistication.

(ii) The RNA sub-sector II comprising of products and/or activities which are often, though not always, seasonal, which are run with the help primarily of unpaid family labour, using rather primitive technology, catering mostly to the local market and responding more to the supply side of the labour market than to the market demand for output.[8]

Much of the controversy regarding the nature and dynamics of RNA can be easily resolved if one allows for their essential heterogeneity within the sector. We try below to characterise a prototype Asian rural economy when a RNS with its bimodal character is embedded in the system.

## II

A phenomenon which has a crucial bearing on the structure of RNA is the pattern of landownership that prevails in the rural sector. The prevalence of RNA-II is seen to be directly linked with the incidence of landlessness or nearlandlessness. In South Asia where this is high, weight of RNA-II in the total RNS is also high. The same can be said of South East Asian countries like the Philippines, whereas in South Korea where landlessness is minimal, it is RNA-I or the more dynamic component of RNA which prevails. While the possible explanation for this association may be fairly straightforward, all the ramifications of such a link-up may not be all that obvious.

To see this, let us resort to a classification of the farming population in a rual economy that has been done by Roemer (1982) in his highly innovative extension of Marxian analysis of class and exploitation. Assume that there are three main categories of people in the rural sector: (i) capitalist farmers; (ii) owner-operators and, (iii) landless labourers. The capitalist farmer hires wage labour from (iii) and possibly (ii) at a price. It has been argued that in the presence of surplus labour on land the hiring price of labour will be less than the competitive market rate (Bardhan 1974). The owner-operator primarily works on his own plot which may or may not yield enough output for his subsistence. The allocation of labour time by the owner-operator between working on his own plot of land and hiring his services out for wage labour on capitalist farms will depend on the relative weight or productivity of his own plot and the going wage rate. Clearly, the higher the former, cet par, the lower will be his availability for wage work. If it outstrips the latter, the owner-operator may even hire in labour services. The landless labourer of course has no option but to hire himself out for wage work on capitalist or owner-operated farms.

Within this set up Roemer (1982) expounds the emergence of five classes in a prototype rural economy characterised by accumulation. Individuals are differentiated by their position *vis-a-vis* the labour market, i e, whether or not they are hiring in or hiring out labour services and whether or not they are self-employed. Based on possible combinations of labour market characteristics, five classes emerge. These have the profiles shown in Table 1. The five classes correspond to (1) pure capitalist farmers; (2) owner-operators using hired labour; (3) pure owner-operators; (4) marginal farmers and (5) landless labourers. By the Class Exploitation Correspondence Principle as expounded by Roemer, these classes fall in a hierarchy of status, with classes hiring in labour services corresponding to Marxian exploiter classes and those hiring out such services coinciding with the exploited.

TABLE 1

| | Self-Employment (SE) | Hiring In (HI) | Hiring Out (HO) |
|---|---|---|---|
| (1) | = 0 | >0 | = 0 |
| (2) | >0 | >0 | = 0 |
| (3) | >0 | = 0 | = 0 |
| (4) | >0 | = 0 | >0 |
| (5) | = 0 | = 0 | >0 |

How does this stylised picture of the rural economy change if we introduce RNA of the two varieties? Clearly the landless worker has more than one option now: he can work in the non-farm sector rather than go in for agricultural wage work. But so do other categories of people.

If RNA-I broadly corresponds to rural manufacturing and service activities with linkages with capitalist agriculture and urban industry, it is likely that the rural rich may indeed get involved in these activities. Evidence from South Asia suggests that the proportion of family income contributed by RNA is high for large land-owning classes (Islam 1983). In South Korea, much of the increase in income generated by RNA is attributable to salaries and wages earned in non-farm enterprises in the rural sector. Clearly such enterprises will fall in the RNA-I category. However, presumably t.. only kind of employment that RNA-II can provide is self-employment. In any case, with the inclusion of the two kinds of RNA and the labour market characteristics of a person with respect to them, the possible class categories get multiplied several times. With each of the earlier five categories, one now has to combine the available options in RNA-I and RNA-II. Since by definition, RNA-II is a subsistence activity, there are only two options open to an individual with regard to RNA-II: either to be self-employed in RNA-II or not to indulge in it at all. However, with RNA-I, which operate primarily with the help of the labour marke for wage work, the options are many. I principle corresponding to the thre categories of labour use (SE, HI and HO) there should be eight possible combinations The choice of an individual agent consist of picking one element out of each one o the column subsets. Clearly some option are ruled out for obvious reasons. For instance, (Table 2), option A6 from column one, coupled with option I.8 from column (2) and option II.2 from column (3) would be ruled out as this combination would characterise a non-worker rather than a worker. Similarly all options combining A1 or A2 with II.1 are ruled out, because it is highly improbable that a landowner who operates his farm primarily, if not solely, with hired labour is going to also indulge in low-productivity self-employment in the rural non-farm sector. In the same vein, a landless agricultural labourer or marginal farmer is not very likely to own or hire in wage labour in the more sophisticated variety of RNA. Thus options combining A.4, A.5 or II.1 with options I.2, I.3, I.5 or I.7 are rather improbable.

TABLE 2

| Agriculture | | | | RNA-I | | | | RNA-II | |
|---|---|---|---|---|---|---|---|---|---|
| | SE | HI (1) | HO | | SE | HI (2) | HO | | SE (3) |
| A1 | =0 | >0 | =0 | I.1 | >0 | =0 | =0 | II.1 | >0 |
| A2 | >0 | >0 | =0 | I.2 | >0 | >0 | =0 | II.2 | =0 |
| A3 | >0 | =0 | =0 | I.3 | >0 | >0 | >0 | | |

| | | | | I.7 | =0 | >0 | =0 | | |
| | | | | I.8 | =0 | =0 | =0 | | |

TABLE 3

| | SA | RNA-I | CA | RNA-II | RW |
|---|---|---|---|---|---|
| SA | X | X | 0 | 0 | 0 |
| RNA-I | X | X | 0 | 0 | 0 |
| CA | 0 | 0 | X | X | X |
| RNA-II | 0 | 0 | X | X | X |
| RW | 0 | 0 | X | X | X |

Without getting into the process of complete enumeration of likely combinations, it is easy to see that the introduction of RNA, especially of RNA-I into the picture, throws overboard the simple correspondence of class categories with the incidence of 'exploitation' as expounded in Roemer's CECP (class exploitation correspondence principle). In the same way, it invalidates the Hymer-Resnick proposition that the rural non-farm sector necessarily contracts with growing income.[9]

This happens because the hiring out of labour services under RNA-I would in general be done by the more affluent sections of rural society. As mentioned earlier, some of the fastest growing components of rural income in S Korea are comprised of wages and salaries earned in industrial units located in the rural sector. The expropriator of surplus in such cases, if at all identifiable, may perhaps be located outside the sector. No such problems are posed by the presence of RNA-II however. For the purpose at hand option II.1 can be treated at par with categories A.3, A.4 or A.5. A combination of (A.3, I.8, II.1) for instance would entail a case of pure self-reproduction, while (I.8, II.1) combined with either A.4 or A.5 clearly generates a state of exploitation. However, RNA-I cannot be treated at par with capitalist agriculture in such analyses, because the labour market correlates of the two are quite different. Introduction of RNA-I into the picture considerably complicates the task of formalisation of the structure of the rural economy.

## III

While introduction of RNA-I leads to a break-down of Roemer's CECP in terms of systemic analysis, it lends itself to a simple representation in a static input-output framework. If RNA-I and RNA-II are haracterised by different types of produc- on linkages, the static inter-industry flow atrix of a rural economy with RNA can e represented as in Table 3 where SA, CA nd RW stand for subsistence agriculture, apitalist agriculture and the 'rest of the orld' (comprising of the domestic urban nd export sector) respectively. In terms of roduction linkages, therefore, the system is fully decomposable one. The interlinkages merge mainly through consumption as well s factor supplies.[10]

One way of going about the task would e to look into the consumption profiles of, nd income generation processes for, all ossible categories of households as is done n the analysis of Social Accounting Matrices—or SAM, as they are popularly alled.[11] Along with this, one could try to race out the sector-wise consumption inkages. RNA-II producers as well as sub- istence farmers who produce less than their equirements, need to buy food from capi- alist agriculture, which is the major source f marketable surplus of foodgrains in the ystem. This in turn is made possible by the rovision of labour services by land and asset- ess people on capitalist farms. Thus, capitalist griculture provides the crucial link—both vays—between the two sub-systems.

The parameter that emerges to be of trategic importance is the price of food. The oodgrains sector is hardly competitive. With ssured demand and subsidised inputs (like rrigation water and fertilisers), prices are sticky downwards. In years of good harvest, those involved in subsistence agriculture and RNA-I gain in terms of steady demand for abour and real wages. However in bad years, the vulnerability of this category of people is compounded by a fall in labour demand in capitalist farming and consequent overcrowding in subsistence activities, as well as by fall in real wages through the rising price of food and depressed money wages. Any attempt at modelling the dynamics of the system has to capture these crucial dependencies.

The picture that emerges is clearly one of dualistic growth, but it is a dualism that, unlike the classical dualism of Arthur Lewis or Ragner Nurkse, cuts across sectors. In other words, a realistic characterisation of the Indian economy for instance, can no longer presume the entire farm sector to be of the subsistence type or for that matter, the whole of the manufacturing sector to be of the capital intensive, modern variety. The broad logic of the earlier vintage of dual economy models whereby steady growth in the modern industrial sector uses up an increasingly larger proportion of labour on land has failed to characterise the experience in many Asian countries plagued with a high rate of growth of population and a low rate of absorption of labour in the modern manufacturing sector. Rather, the spread of technology seems to have penetrated almost all the sectors but has done so only to a limited extent. Thus every sector, so to speak, seems to have its modern as well as the low-technology, 'informal' components.

Recognition of this dualism within the farm sector has led some researchers to try modelling the implications of a dualistic agriculture (Sen 1965, Bardhan 1972, 1984). While the major thrust of Sen's paper has been on the characterisation of peasant farmers as suppliers of labour, Bardhan's work is more concerned with the likely dynamics of the system. In Bardhan's 1972 model, the structural dualism of the system is reflected in the differential access of the capitalist farmer and peasant cultivator to inputs, credit and other infrastructural facilities. This in its turn is embodied in discrimination in input prices, which in the model is visualised as a decreasing function of landholdings. The pattern of growth that emerges is thus embedded in the structural postulates whereby accumulation of land in the hands of capitalist farmers leads to continuous depletion of land and labour supply in peasant agriculture.

We feel that any realistic modelling of the rural economy with the two kinds of RNA would have to take into account the essential production and consumption linkages of the system as specified in Section III above. The dynamics of the system will depend upon the rate of sectoral accumulation of capital and the nature of use to which it is put, as also on some relatively exogenous parameters, like the growth of labour on land and the growth of demand in the RW (rest of the world) sector. The latter includes the rate of growth of export demand (Thai textiles, or Philippino handicrafts) as well as the development of backward linkages in the urban manufacturing sector (S Korea). Establishing production linkages of rural industries with the farm sector (which we could call the Chinese solution) would be another way of revitalising the rural economy.

In the final analysis, all successful solutions to rural development problems—which, to our mind, is synonymous with the gradual shrinking in both relative as well as absolute terms, of subsistence agriculture as well as of RNA-II—have to do with ways of mopping up excess rural manpower in productive activities. The actual solution, however, will naturally have to take into account the specificities of the situation at hand.

## Notes

1 See Anderson and Leiserson (1980), Chuta and Liedholm (1979) and Mukhopadhyay and Chee (1985).

2 For details see the country studies in Mukhopadhyay and Chee (1985).

3 This has been the scenario in large parts of Bangladesh and Eastern India where the green revolution has not yet caught on.

4 The experimental path of development chosen by China under Deng Xiaoping in recent years has already come up with a spectacular performance. 1984 has seen a record output of 400 million tonnes of foodgrains (inclusive of tuber crops) on a total cultivated area which is barely 60 per cent of that in India. A massive rural industrialisation policy aims at absorbing upto 40 per cent of the rural labour time in the near future. See IBRD reports on China's new agricultural policy. Also Rawski (1979).

5 Hymer and Resnick did this for the "Z-goods" that are by definition not traded outside the rural economy. See Hymer and Resnick (1969).

6 See Leiserson and Anderson and Chuta and Liedholm. Also Fabella in Mukhopadhyay and Chee.

7 For details see Section II in Mukhopadhyay (1984).

8 Quoted from Mukhopadhyay and Chee.

9 To be fair to Hymer and Resnick, their Z-goods are commodities that are not traded outside the rural sector. They are more like our RNA-II commodities, which indeed would go down with a rise in income and contraction in the subsistence agricultural sector. Cf Mukhopadhyay and Chee (1985) on this issue.

10 For details see Section III in Mukhopadhyay (1984).

11 SAM, or social accounting matrices are being extensively experimented with to accommodate the analysis of income generation processes and consumption characteristics of different social classes alongside standard input-output analysis. The augmented SAM matrices for many countries have been constructed and being worked with. For an early description of the construction and use of SAM, see IBRD Staff Working Paper: 463. For an example of the use of SAM in computable general equilibrium models, see Dervis, de Melo and Robinson (1982).

# Census of 1981 and the Structure of Employmen

**Sudha Deshpande**

**L K Deshpande**

*The economic data available from the Census of 1981 has given rise to two diametrically opposite views on the change in the structure of employment. Even when the shift away from agriculture is granted doubts are expressed regarding the nature of change.*

*This paper examines the sectoral change at more disaggregated levels and relates the census data on employment to net domestic product and concludes that the shift in employment away from agriculture is likely to have benefited all except four per cent of the male and all but 12 per cent of the main workers of both sexes in 1981.*

THE economic data available from the Census of 1981 has given rise to two diametrically opposite views. Late J N Sinha argued that the structure of employment in 1981 was no different from what it was in 1961 or for that matter, in 1901.[1] J Krishnamurty, relying on the NSS and the Census, doubts the "conventional wisdom of changelessness of the structure of employment".[2] He accepts the fact of the shift away from agriculture but is not sure of its extent and much less of the nature of change. According to him, whether the change is for good or bad depends on its causes and he suggests three. First, the change may be a consequence of growth in income; secondly it may reflect the inability of agriculture to absorb the new additions to labour force and thirdly, it may reflect the increasing casualisation of labour brought about by the "trends" within agriculture. To him, the change in the occupational structure is welcome only if it is caused by the first of the three causes. It is not a "happy situation" otherwise.

One would have to resort to a large number of sources to judge the nature of change. The Census itself contains evidence which would throw some light on the nature of change. One would pursue the sectoral shift in employment to lower levels of aggregation and find out how the work force is distributed by industry divisions, major and minor industry groups and by occupational divisions and groups. Besides being of instrumental value in judging the nature of change, the disaggregated analysis has an intrinsic importance as well. Section I of this paper presents the disaggregated data with comments on its bearing on the nature of change and Section II presents changes in per capita NDP and other rather crude indicators of the nature of change, to derive the conclusions given in Section III. Throughout the three sections, we restrict ourselves to main workers and among them to males only in the hope that such a restriction would ensure for greater comparability in the decennial data. For the same reason we exclude Assam from the 1971 data.

## I

We begin with Table 1, which brings out the much debated sectoral shift in employment—away from primary and towards secondary and tertiary sectors, more towards the former than towards the latter. The Table shows that employment in the secondary sector grew the fastest among the three sectors—by a little over 47 per cent. The secondary sector consists of activities dominated by wage employment and hence could be presumed to afford less scope for disguised unemployment in relation to the other two sectors Changes within the tertiary sector are n less interesting. Employment in "Othe Services" grew eight percentage points les than in the tertiary sector taken as whole. Consequently its share within th sector was three percentage points smalle in 1981 than a decade earlier. The Censu of 1981 shows an absolute decline o 2,19,000 in Personal Services over 1971. Th workers in this group are likely to be the poorest in the sector and most likely to change their employment, should new opportunities present themselves.

TABLE 1: SECTORAL DISTRIBUTION OF MALE MAIN WORKERS 1971 AND 1981 AND PERCENTAGE CHANGE IN EMPLOYMENT BY SECTORS 1971-1981

| Sector | 1971 | 1981 | Percentage Change in Employment 1971-1981 |
|---|---|---|---|
| Primary | 69.67 | 65.60 | 15.07 |
| Secondary | 12.03 | 14.53 | 47.49 |
| Tertiary | 18.30 | 19.87 | 32.73 |
| Total | 100.00 | 100.00 | 22.20 |
| Tertiary (as 100.00) | 100.00 | 100.00 | 32.73 |
| Trade and commerce | 34.79 | 36.89 | 40.59 |
| Transport | 15.64 | 16.70 | 41.97 |
| Other services | 49.57 | 46.71 | 24.28 |

*Notes:* Data relate to India excluding Assam for both the years in Tables 1 to 8.
Primary includes agriculture and allied industries.
Secondary includes mining, manufacturing and construction.
Tertiary includes trade and commerce transport and other services.

TABLE 2: DISTRIBUTION OF MALE MAIN WORKERS BY INDUSTRIAL CATEGORIES 1971 AND 1981 AND PERCENTAGE CHANGE IN EMPLOYMENT IN EACH CATEGORY 1971-1981

| Industrial Category | 1971 | 1981 | Percentage Change in Employment 1971-1981 |
|---|---|---|---|
| I Cultivators | 45.88 | 43.70 | 16.39 |
| II Agricultural labourers | 21.55 | 19.56 | 10.92 |
| III Livestock, forestry, fishing, etc | 2.24 | 2.34 | 30.76 |
| IV Mining and quarrying | 0.54 | 0.62 | 40.25 |
| V Manufacturing: | | | |
| a) Household industry | 3.42 | 3.18 | 13.44 |
| b) Other than household industry | 6.71 | 8.92 | 62.45 |
| VI Construction | 1.36 | 1.81 | 62.38 |
| VII Trade and commerce | 6.37 | 7.33 | 40.59 |
| VIII Transport, storage and communications | 2.86 | 3.32 | 41.97 |
| IX Other services | 9.07 | 9.22 | 24.28 |
| Total | 100.00 | 100.00 | 22.20 |

*Source:* Same as in Table 1.

Table 2 presents the changes in the distribution of employment by industrial categories. It shows that employment in non-household industry and construction grew at rates far above the average for all industries. The categories that grew much slower than the average and therefore lost their shares, relative to 1971, are agricultural labourers, household industry and cultivators. It is difficult to think of an explanation, bearing on the concepts used and instructions issued by the Census, that would have led to an undercount of workers in these categories and their misplacement in those that show high rates of growth. The other than household industry of the Census consists of factories and non-household non-factory establishments. According to the data available from Employment Market Information, the factory employment in India increased by 42.20 per cent, from 5,083 thousand in 1971 to 7,228 thousand in 1981.[3] Excluding the EMI factory employment from the Census employment in other-than-HHI we could arrive at the employment in the non-HHI non-factory segment of the manufacturing sector. Employment in this sector increased from 4,664 thousand in 1971 to 8,606 thousand in 1981, i e, by 84.52 per cent. Thus it is clear that the unorganised segment of the manufacturing sector (HHI + non-HHI non-factory) grew a little faster than the organised and consequently its share within manufacturing increased marginally from 65.48 per cent in 1971 to 66.35 per cent in 1981. Judged by this increase in the share of the unorganised manufacturing sector, the shift of the structure away from agriculture may not appear very beneficial to the economy. However the final judgment would have to depend on the change in per capita income consequent on the shift, rather than on the evidence of decline in the share of the organised sector.

The Census data on employment by division of industry excludes cultivators and agricultural labourers. Table 3 shows that employment in public utilities grew the fastest (at 98 per cent in rural, 75 per cent in urban and 84 per cent in both taken together). In rural areas, finance, transport, construction and manufacturing 3 registered substantially higher rates of growth. In urban areas it is public utilities, construction and manufacturing 3 that grew at rates far above the urban average. In both rural and urban India, the fast growing industries are not the types that could be characterised as "sponges" to absorb labour unable to find a place elsewhere.

In Table 4 we give the share of an industry division in the total change in non-farm employment. Total non-farm employment increased by 17,905 thousand,

| 7 Transport | 1744 | 9.74 | 998 | 8.90 | 746 | 11.14 |
| 8 Finance insurance | 497 | 2.78 | 347 | 3.10 | 150 | 2.24 |
| 9 Services | 2763 | 15.43 | 2161 | 19.18 | 602 | 8.99 |
| Total | 17905 | 100.00 | 11211 | 100.00 | 6694 | 100.00 |

*Source:* Same as in Table 1.

63 per cent of which was in urban and 37 per cent in rural areas. For the country as a whole, manufacturing 2 and 3 together accounted for nearly 38 per cent of the new jobs created. Trade and services follow with shares of 18.21 and 15.43 per cent respectively. The share of manufacturing does not vary between rural and urban areas but in the rural areas transport rather than services ranks as the fourth largest acceptor of labour.

Ten major industry groups in India accounted for nearly 57 per cent of the change in non-farm employment. These industry groups and their shares are given in Table 5 for the country and urban and rural areas separately. Retail trade and repairs are likely to be the industries in which productivity may be low. However, the collective share of these two divisions in the total change in employment in the 10 groups does not exceed 18 per cent anywhere.

If one observed the changes of occupation (Table 6) then too one finds that professional and technical occupations, production and transport equipment operators (occupation codes 7, 8 and 9), administrative, clerical and sales occupations grew between three to four per cent per annum during the decade 1971-1981 while service occupations (Code 5) grew at 1.4 per cent. Consequently its share in the occupational structure fell from 10.30 per cent in 1971 to 8.54 per cent in 1981.

In rural areas production and process workers, transport equipment operators, etc, accounted for nearly 52 per cent of the additional work force (Table 7). Its share in urban areas was 46 per cent and for the country, 48 per cent. The share of sales occupations at 15 per cent in urban and 14 per cent in rural areas, is relatively much smaller. In Table 8 we give the top 10 occupations ranked by their shares in the change in employment between 1971-1981. These ten occupations account for 54 per cent, 52 per cent and 61 per cent of the new employment generated during the decade for the country as a whole and urban and rural areas respectively. We could identify occupations listed in occupational groups X, 43, 99, and 79 as hotbeds of disguised unemployment. These occupations account for 20 per cent of the decennial change in employment at the national and urban level and 26 per cent at the rural level. Thus the evidence internal to Census suggests that the change in employment structure noticed during 1971-1981 is likely to have been brought about by what Krishnamurty calls "positive factors".

TABLE 5: TEN MAJOR INDUSTRY GROUPS ABSORBING OVER 50 PER CENT INCREASE IN MALE EMPLOYMENT BETWEEN 1971 AND 1981

| Industry Group | Description | Rank | Percentage Share in Total Change in Male Employment |
|---|---|---|---|
| **Urban + Rural** | | | |
| 65 | Retail trade in food and food articles, beverage, tobacco and intoxicants | 1 | 8.11 |
| 70 | Land Transport | 2 | 7.79 |
| 39 | Repair | 3 | 7.24 |
| 50 | Construction | 4 | 6.34 |
| 90 | Public administration and defence services | 5 | 5.95 |
| 26 | Manufacture of textile products (including weaving apparel other than footwear) | 6 | 5.22 |
| 92 | Education, scientific and research services | 7 | 4.50 |
| 23 | Manufacture of cotton textiles | 8 | 4.46 |
| 20 and 21 | Manufacture of food products | 9 | 4.23 |
| 99 | Services not elsewhere classified | 10 | 3.06 |
| | Total | | 56.90 |
| **Urban** | | | |
| 90 | Public administration and defence services | 1 | 8.21 |
| 65 | Retail trade in food and food articles, beverage, tobacco and intoxicants | 2 | 7.44 |
| 70 | Land transport | 3 | 7.13 |
| 39 | Repair | 4 | 6.23 |
| 50 | Construction | 5 | 5.39 |
| 26 | Manufacture of textile products (including weaving apparel except footwear) | 6 | 4.61 |
| 99 | Services not elsewhere classified | 7 | 4.42 |
| 23 | Manufacture of cotton textiles | 7 | 4.42 |
| 20 and 21 | Manufacture of food products | 8 | 3.51 |
| 68 | Retail trade in others | 9 | 3.27 |
| 92 | Education, scientific and research services | 10 | 2.89 |
| | Total | | 57.52 |
| **Rural** | | | |
| 65 | Retail trade in food and food products, beverage, tobacco and intoxicants | 1 | 9.23 |
| 70 | Land transport | 2 | 8.92 |
| 39 | Repair | 2 | 8.92 |
| 50 | Construction | 3 | 7.93 |
| 92 | Education, scientific and research services | 4 | 7.19 |
| 26 | Manufacture of textile products (including weaving apparel except footwear) | 5 | 6.23 |
| 01 | Plantations | 6 | 5.53 |
| 20 and 21 | Manufacture of food products | 7 | 5.45 |
| 23 | Manufacture of cotton textiles | 8 | 4.54 |
| 27 | Manufacture of wood and wood products, furniture and fixtures | 9 | 3.84 |
| 32 | Manufacture of non-metallic mineral products | 10 | 3.67 |
| | Total | | 71.45 |

TABLE 6: DISTRIBUTION OF MALE MAIN WORKERS* BY OCCUPATIONAL DIVISIONS 1971 AND 1981 AND PERCENTAGE CHANGE IN EMPLOYMENT 1971-1981

| | Occupational Division | 1971 | 1981 | Percentage Change in Employment 1971-1981 |
|---|---|---|---|---|
| 0-1 | Professional, technical and related | 8.30 | 8.64 | 14.72 |
| 2 | Administrative, executive and related | 3.43 | 3.43 | 0.38 |
| 3 | Clerical | 10.59 | 10.70 | 3.57 |
| 4 | Sales | 14.55 | 14.60 | 3.57 |
| 5 | Service | 10.30 | 8.54 | 16.18 |
| 6 | Farmers | 7.21 | 6.05 | 10.20 |
| 7, 8 & 9 | Production and related transport equipment operators and labourers | 44.14 | 45.35 | 46.21 |
| X | Workers not classified by occupations | 1.48 | 2.69 | 149.22 |
| | Total | 100.00 | 100.00 | 37.61 |

*Note:* Excluding cultivators and agricultural labourers.

## II

As observed in the introduction, to judge the nature of change one would have to resort to many sources of data besides the Census. The debate could be settled conclusively if we had for the years 1971 and 1981 the distribution of personal income by industry and occupations listed by the Census. In the absence of such data we use a very crude indicator, the NDP. In columns 3 and 6 of Table 9 we compare the real net domestic product per main worker (male and female) in 1971 and 1981. Of the 11 industry divisions given in the Table real per worker NDP shows a decline in 1981 over 1971 in four divisions. They accounted for 75 per cent of the main work force in 1971 and 73 per cent of that in 1981. It would be wrong to conclude from this evidence that the shift in the structure has harmed nearly three-forths of the work force. We have to find out what the per worker real NDP would have been if the structure of employment in 1981 were the same as in 1971. Assuming constancy, the per main worker real NDP would have been Rs 1,225 instead of Rs 1,282 in agriculture; Rs 1,298 instead of Rs 1,262 in forestry, logging and fishing; Rs 6,155 instead of Rs 6,311 in construction and Rs 1,732 instead of Rs 1,470 in unregistered manufacturing. These figures show that the workers in agriculture are better off and those in forestry, logging and fishing, construction and unregistered manufacturing the worse off in 1981 with the change than without it. Thus viewed, the losers account for 11.9 per cent of the work force in 1981.

If we restrict ourselves to male main workers only then the comparison of columns (4) and (7) of Table 9 shows that the real per capita NDP improves marginally in agriculture and unregistered manufacturing but declines in forestry, logging and fishing and construction. These two divisions account for 4.1 per cent of the male workers in 1981. Either way an overwhelming majority—88 per cent of main workers of both sexes and 96 per cent of males are likely to be better off by the change in the structure of employment.

Our argument could be faulted on the ground that we have not taken into account the possibility of the worsening of income distribution. Here again no direct evidence is available. In Table 10 we compare the share of employee compensation in the factor incomes in 1971 and 1981. The employee compensation as a share has increased in primary, finance and real estate, community and personal services and for the economy as a whole. It shows

TABLE 7: CHANGE IN ABSOLUTE MALE EMPLOYMENT (IN '000'S) BY OCCUPATIONAL DIVISIONS 1971-1981 AND THE SHARE OF EACH OCCUPATIONAL DIVISION IN THE TOTAL CHANGE

| Occupational Division | India | | Urban | | Rural | |
|---|---|---|---|---|---|---|
| | Change in Employment | Per Cent Share in Total Change | Change in Employment | Per Cent Share in Total Change | Change in Employment | Per Cent Share in Total Change |
| 0-1 | 1700 | 9.49 | 1055 | 9.41 | 645 | 9.63 |
| 2 | 610 | 3.41 | 816 | 7.28 | −206 | −3.07 |
| 3 | 2042 | 11.40 | 1284 | 11.45 | 758 | 11.32 |
| 4 | 2626 | 14.67 | 1701 | 15.17 | 925 | 13.82 |
| 5 | 688 | 3.84 | 534 | 4.76 | 154 | 2.30 |
| 6 | 532 | 2.97 | 204 | 1.82 | 328 | 4.90 |
| 7-8-9 | 8658 | 48.36 | 5193 | 46.32 | 3465 | 51.77 |

TABLE 8: FIRST TEN OCCUPATIONAL GROUPS WHICH ABSORBED OVER 50 PER CENT OF THE TOTAL INCREASE IN MALE EMPLOYMENT 1971-1981

| Occupational Group | Description | Rank | Percentage Share in Total Change in Male Employment |
|---|---|---|---|
| **Urban + Rural** | | | |
| 40 | Merchants and shopkeepers, wholesale and retail trade | 1 | 7.95 |
| 35 | Clerical and related workers n e c | 2 | 6.85 |
| 98 | Transport equipment operators | 3 | 6.48 |
| X | Workers not classified by occupations | 4 | 5.86 |
| 43 | Salesmen, shop assistants and related workers | 5 | 5.75 |
| 75 | Spinners, weavers, knitters, dyers and related workers | 6 | 5.65 |
| 84 | Machinery fitters, machine assemblers and precision instrument makers (except electrical) | 7 | 4.75 |
| 99 | Labourers n e c | 8 | 4.60 |
| 79 | Tailors, dress makers, sewers, upholsterers and related workers | 9 | 3.53 |
| 15 | Teachers | 10 | 3.41 |
| | Total | | 54.83 |
| **Urban** | | | |
| 43 | Salesmen, shop assistants and related workers | 1 | 6.95 |
| 35 | Clerical and related workers n e c | 2 | 6.67 |
| 40 | Merchants and shopkeepers, wholesale and retail trade | 3 | 6.54 |
| 98 | Transport equipment operators | 4 | 6.28 |
| 99 | Labourers n e c | 5 | 5.40 |
| 84 | Machinery fitters, machine assemblers, precision instrument makers (except electrical) | 6 | 5.13 |
| 75 | Spinners, weavers, knitters, dyers and related workers | 7 | 4.77 |
| X | Workers not classified by occupations | 8 | 3.79 |
| 79 | Tailors, dress makers, sewers, upholsterers and related workers | 9 | 3.57 |
| 24 | Working proprietors, directors and managers, mining, construction manufacturing and related concerns | 10 | 3.09 |
| | Total | | 52.19 |
| **Rural** | | | |
| 40 | Merchants and shopkeepers wholesale and retail trade | 1 | 10.32 |
| X | Workers not classified by occupations | 2 | 9.34 |
| 35 | Clerical and related workers n e c | 3 | 7.16 |
| 75 | Spinners, weavers, knitters, dyers and related workers | 4 | 7.11 |
| 98 | Transport equipment operators | 5 | 6.81 |
| 15 | Teachers | 6 | 5.66 |
| 84 | Machinery fitters, machine assemblers and precision instrument makers (except electrical) | 7 | 4.10 |
| 43 | Salesmen, shop assistants and related workers | 8 | 3.73 |
| 79 | Tailors, dress makers, sewers, upholsterers and related workers | 9 | 3.47 |
| 65 | Other farm workers | 10 | 3.32 |
| | Total | | 60.92 |

*Source:* Same as in Table 1.

a decline in secondary and transport communication and trade. Of the secondary sector construction is the only industry division that shows a decline in per worker domestic product, while in transport, communication and trade there is no division which indicates such a decline. Thus barring a little over four per cent of the work force in 1981, the rest of the main male workers are unlikely to be worse off judged by the crude indicators available presently.

The shift in the employment away from agriculture may be reflective of a shift in private expenditure away from food to non-food items shown in Table 11. Real private consumption expenditure has shifted away from food, beverages and tobacco to clothing and footwear, furniture, furnishing and household, etc, medical care and health and transport and communications and miscellaneous goods and services. The shift in expenditure suggest that the observed change in the structure of employment could not be attributed to the incapacity of agriculture to absorb more labour.

## III

The following tentative conclusions emerge from the above:

1 The structure of employment in the Indian economy has shifted away from agriculture.

2 The Census data at the disaggregated level of industry divisions, major and minor groups and occupational levels does not contradict the claim that the shift away from agriculture may have taken place due to "positive growth factors". The data on private expenditure also suggests that the shift in employment may have been a consequence of the operation of Engel's Law.

3 The evidence on per worker net domestic product as well as the distribution of factor incomes suggests that the shift in the structure of employment has benefited an overwhelming majority of the work force.

TABLE 9: NET DOMESTIC PRODUCT AT FACTOR COST BY INDUSTRY OF ORIGIN, PER MAIN WORKER AND PER MAIN MALE WORKER (AT 1970-71 PRICES)

| Services: | | | | | | |
| a) Administration | 1635 | 3343 | 3455 | 3588 | 5853 | 6189 |
| b) Other services | 1650 | 1660 | 2084 | 2185 | 1758 | 2273 |
| Total | 34519 | 1959 | 2376 | 47235 | 2123 | 2660 |

*Notes:* Columns (3) and (6) relate to all main workers (males + females) in the respective Censuses while columns (4) and (7) relate to main male workers. Workers in agriculture, in these columns include cultivators and agricultural labourers. Workers in other industry divisions except manufacturing are workers classified by industry divisions according to National Standard Classification of Industries in the Census. Employment in registered manufacturing relates to factory employment available from Employment Market Information. But as this data was not available by sex, income per worker in registered manufacturing in column (3) and column (4) as well as column (6) and column (7) are identical. Employment in unregistered manufacturing includes employment in household industry in the Census + estimated employment in non-household industry-non-factory sector as explained in the text.

| 5 Medical care and health expenditure | 2.0 | 2.7 |
| 6 Transport and communications | 5.0 | 7.1 |
| 7 Recreation entertainment, education and cultural services | 3.6 | 3.5 |
| 8 Miscellaneous goods and services | 3.8 | 4.0 |
| Total | 100.00 | 100.00 |

*Source:* Same as in Table 10, Statement II, pp 38-39.

## Notes

1 Sinha, J N, '1981 Census Economic Data', in *Economic and Political Weekly*, Vol XVII, No 6, February 6, 1982.

2 Krishnamurty, J, 'Changes in Indian Work Force', in *Economic and Political Weekly*, Vol XIX, No 50, December 15, 1984.

3 The employment in factories obtained from the EMI includes females and is not strictly comparable with the Census data relied on in the rest of the paper. Exclusion of female workers would strengthen our conclusion of the relatively faster growth of unorganised sector.

DISCUSSION

# Export Optimism and Import Liberalisation

**Jayati Ghosh**

RECENTLY, arguments that reject export pessimism and propound a macro-economic strategy which is based on a major aggressive thrust in export markets have become increasingly common in the Indian context. Bhagwati and Srinivasan (*EPW*, November 24, 1984) have reiterated their well known views that economic policies determined by "unwarranted export pessimism" have been responsible in large part for India's hitherto unsatisfactory performance. They take issue with Chakravarty (*EPW*, May 19-26, 1984), who has argued that "at this stage India is unlikely to emerge as a leading actor on the export front". Bhagwati and Srinivasan, by contrast, see substantial export growth as a feasible basis for an Indian development strategy, given micro policies for export promotion and "very good macro policies". The latter are implicitly seen to be similar to those of South Korea which has successfully restricted the growth of the product wage in industry and thus improved its competitiveness in world markets.[1]

The issue of export promotion is particularly relevant at the present time when Indian economic policies are undergoing a process of substantial reconsideration and revision. There are two ways of viewing the need for an export promotion strategy. The first, which is related to the general orientation of the growth strategy, is to see export markets as additional or alternative sources of demand which would counteract stagnation or recessionary tendencies in the home market. The second is to view export growth primarily as a means of acquiring foreign exchange to finance increases in imports. Since these two have varying policy implications, it is necessary to consider each in turn.

Consider first exports as a major alternative source of *demand* for domestic producers. The focus on exports in a growth strategy implies that the domestic production structure should be increasingly geared to the requirements of the international market. For a developing country this means that other domestic considerations may have to be relegated to secondary importance. Thus, the requirements of increasing domestic employment, ensuring a better balance between sectors, improving income distribution and providing basic needs may suggest policies which are contrary to those stemming from an export-led growth strategy. Resolution of such a contradiction is ultimately a question of political choice—in India the need for legitimation of the state cannot be ignored.

Besides this, there are other economic factors which affect the possibility of orienting domestic production towards exports. In the past decade the ratio of exports to GDP in India has been between six per cent and eight per cent—a very low proportion which implies that domestic demand has been the overwhelmingly important force in influencing the level of economic activity. In order for external demand to become an impetus sufficiently strong to counteract stagnation in home demand, exports would have to increase substantially as a proportion of GDP. Clearly the nature of the impetus will be affected by the type of forward and backward linkages of exports in the overall production structure. Given the size of the Indian economy, it is apparent that a major expansion in the volume and value of total exports would be required.

Such an expansion would have to be the result of boosting existing exports as well as of increasing diversification. Already in the late 1970s and early 1980s Indian exports have shown considerable diversification. There has been a decline in real value terms of such traditional exports as clothing, jute manufactures, leather and textiles. The highest growth has been recorded in engineering goods and in gems and jewellery—both non-traditional exports. The question is, given the marked decline in demand for a number of India's traditional exports, to what extent can non-traditional exports be increased in order to provide the substantial expansion in total exports that is called for.

## WORLD TRADE SITUATION

Here the world trade situation becomes a relevant concern. Bhagwati and Srinivasan may be quite correct to argue that India's poor export performance in the past has been due to particular economic policies rather than to the global environment, but this says nothing about its importance for the present. It would be foolhardy for an economy of India's size to attempt a major export-driven expansion with complete disregard for the prevailing and projected medium-term external economic context. This consideration was recognised by Bhagwati 1978, p 216 thus: "a corollary to such a prescription for export promotion for more than just a handful of developing countries is that the world trading system be reasonably open and accommodating to the trade needs of such a strategy". As it happens, world economic indicators are not particularly propitious for major increases in exports by a large developing country. There are several features which should encourage caution when estimating the possibilities for the growth of Indian exports.

Firstly, the world economy is recovering only in a very slow and limited way from the latest recession.[2] Furthermore, as the GATT 1984 Report points out, the international transmission of the current recovery has been lower in relative terms than that of any previous post-war recovery. The growth of the US and some other industrial economies has not been matched by a proportionate increase in the level of world trade. This is due both to increasing protectionism as well as to a change in the structure of world trade whereby many traditional OECD imports (including energy sources and some raw materials) are likely to play a diminishing role in future booms.[3] This means not only that the overall growth of the world market is limited and uncertain, but also that future export growth will be highly related to the response of high-technology trade-related investments in economies that can respond quickly and flexibly to changes in the pattern of world demand. An economy such as India's can only hope to achieve such flexibility with a significant time lag, and in any case it is not clear that this is where its comparative advantage lies.

The second feature of world trade that is of relevance is the increasing protectionism by the major industrial economies as well as by other newly industrialising countries, many of whom have been forced to curtail imports drastically in order to generate trade surpluses or wipe out deficits. Such protectionism can only be reinforced by exchage rate movements which tend to allow for the persistent overvaluation of some currencies *vis-a-vis* others. In Europe and North America, market access has been further tightened or has become more uncertain in a number of areas such as agriculture, textiles, clothing, copper, steel and light engineering goods. Meanwhile, primary commodity markets have remained depressed. Specific protectionist tendencies in industrial countries are strong for almost all of the commodities in the production of which some newly-industrialising countries have a comparative advantage. In addition there are growing pressures in the US to erect more general trade barriers to counteract the effects of the high dollar on the US balance of trade. It may be premature to speculate on future protectionism before the outcome of the next round of GATT negotiations is known, but it is unlikely that very many of the existing trade barriers will be dismantled in the near future.

Thirdly, there are now a number of newly-industrialising countries attempting to increase their exports substantially. Much of this thrust is related to the world debt problem, which requires major debtors to generate trade surpluses for purposes of debt-service. An IMF estimate for the next ten years suggests that for the debtor LDCs to repay their debts according to present rescheduling agreements, their total net exports would have to increase by at least 5.5 per cent per annum in real terms.[4] Many of the heavily indebted newly industrialising countries have flexible production structures and are fairly advanced in the export of manufactures—e g, Brazil and Mexico. Furthermore, as long as such countries continue to honour their debt rescheduling agreements rather than default, they will require trade surpluses of a magnitude which can be generated only through export subsidies, competitive devaluations and similar practices which are generally labelled as 'unfair' by trading competitors. Such competition has meant that even South Korea, the darling of the advocates of export-led growth, faced a substantial decline in *all* the major categories of her exports except electronics in 1984. India faces competition not only from the debtor countries but also from Japan and other East Asian economies and from relatively new entrants such as China. Already Indian exports are under pressure from Chinese goods in some Western markets for cheap cotton fabrics and yarn, and in Third World markets for light engineering goods.[5]

### IMPORTANCE OF EXPORTS

These considerations do not imply that India should not devote any energies at all to the development of an export market. On the contrary, some growth in exports is crucial for the economy, and the preceding analysis indicates that a major thrust in policy is required even for India to maintain her present low share of world exports or to increase it to some degree. However, a dependence on export markets as a major source of growth and an alternative to home demand does appear to be ambitious and over-optimistic. Growth in exports in the near future will be a significant, hard-won achievement for India in the present international trading environment.

The importance of exports is not only as a source of demand for domestic producers but also, and possibly more importantly, because of the need for growing imports. Expansion of exports allows for increasing imports as well, with all its consequent advantages in terms of greater domestic availability of goods, increased competition and greater efficiency in production. In any case there are inherent dangers in a balance of trade situation which has suppressed imports down to the level of absolute minimum necessities, as this leaves little leeway for adjustment to import price shocks or unexpected export shortfalls. Therefore, a systematic export promotion drive is necessary if India is to make any impact at all on world markets. What type of strategy should be pursued, is, however, not immediately obvious. Bhagwati and Srinivasan, among others, have argued that allowing domestic and border prices of commodities to move into congruence by removing exchange controls and trade barriers and other similar 'distortions' is the most effective export promotion strategy.[6] The argument is that trade liberalisation, which involves in essence the freeing of import and foreign exchange controls, promotes competition within the economy, dismantles an import-substituting structure which may imply inefficiencies and delays, and helps to make the economy more flexible and better able to adjust to changes in the world economy. The difficulties of a transition to a more flexible regime, in terms of balance of payments difficulties, loss of domestic employment and growing imbalances in the economy, are seen as essentially temporary. Possible long-run results such as greater reliance on foreign investment and foreign capital generally are considered as being beneficial in promoting efficiency and national competitiveness.

### IMPORT LIBERALISATION

The basic issues involved in this argument have been widely debated and will not be investigated further here. But certain points of immediate relevance to the Indian case deserve to be made. The first is that such trade liberalisation essentially results in a once-for-all level change in economic activity rather than providing a continuous impetus to the rate of growth of either the whole economy or exports alone. The second is the startlingly simple but often ignored point that such import liberalisation is essentially a gamble with respect to domestic demand and supply responses as well as world absorption of future exports. Thus, as Diaz-Alejandro has pointed out, "most LDCs can influence their long run import level by encouraging or discouraging exports, while they are unlikely to expand exports just by increasing their imports ... The least risk strategy is clearly *first* to get exports up and *then* to liberalise imports" 1975, pp 93-133 . Export promotion is intimately related to a whole range of domestic policies on the macro-economy, industry, infrastructural development, exchange rates, etc. Limitations on imports form only one part of this, and often are by no means crucial. This means that the simple freeing of imports may result in substantial balance of payments deficits, while the freeing of exchange controls could lead to capital flight such as that which has increasingly characterised capital flows from Brazil, Mexico, Chile and even South Korea.

Even if such a gamble pays off in the long run (an outcome which is highly unpredictable) there is little doubt that at least in the short and medium run, import liberalisation on a substantial scale will involve growing balance of payments deficits. Therefore it is necessary to be aware of how the economy will be able to finance these deficits, whether by approaching the IMF or private capital markets. In the near future there may be an incentive to use loans from Eurocurrency credit markets, because so far borrowing by India from international private capital markets is very low, India's credit rating is good and it would be possible to acquire loans at low spreads above LIBOR. (At the moment the estimate for new loans to India is a spread of between 0.75 per cent and one per cent above the London Interbank Offer Rate which generally is the basis for Eurocurrency loan transactions.)

Given the recent experience and continuing difficulties of countries which are heavily indebted to private capital markets, it is extremely unlikely that those determining Indian financial strategy will make a mistake of the same magnitude, so that caveats in this regard may be superfluous. Nevertheless it should be remembered that international financial markets are qualitatively very different now from what they were in the 1970s when most of the heavy debtors contracted their loans. Real interest rates are generally at their highest historical levels and do not have the promise of falling very much in the near future. The average maturity for loans presently available to India and similar economies is approximately nine years, with grace periods of two years or less, while LIBOR has been between 11 and 13 per cent in 1985.[7] Euromarket lenders have also become much more cautious in protecting their loans. LDC borrowers are not likely to be a major focus of private banks' interests in the next decade. There is evidence that banks are looking to the US and Japan as sources of the next boom, because of deregulation and lack of political risk, while profit increases in the future are more likely to be concentrated in the operating rather the lending side.[8] All this implies that private capital markets cannot be seen as an easy source of finance for Indian BOP deficits in the coming decade.

The point is that import liberalisation is not the only way to promote exports systematically, nor is it necessarily the most suitable method for all economic regardless of their particular circumstances. In fact, many of the most successful cases of export promotion have involved some degree of import substitution as well. This is true of the classic example of Japan as well as newly industrialising countries like South Korea and Brazil. Thus in South Korea the export drive took off from an industrial base built behind high protectionist barriers designed to promote labour intensive import substitution as well as exports.[9] Often the genuinely import-competing industries are still protected after partial decontrol of the trade regime, so that the import liberalisation measures are confined to goods and services that encourage exports but do not compete with established domestic industry.

Thus the nature of alternative regimes is not as clear-cut as Bhagwati and Srinivasan appear to imply. Even the IMF 1985, p 12 notes that an outward-looking approach "is not synonymous with export-led growth, since certain types of import substituting production are also likely to be encouraged".

### EXPORT PROMOTION STRATEGY

In the Indian case it is quite feasible to think of the following export promotion strategy. This would maintain a number of major import controls, but would liberate the regime to some degree for exporters by offering them duty-free access to imports worth upto some proportion of the value of their exports.[10] Such a strategy would counteract the anti-export bias in an import-substituting system and provide exporters with access to necessary or cheaper imports to promote efficiency. Meanwhile a system of dual or multiple exchange rates could provide additional incentives for exporters by making their goods more competitive in world markets. In fact there is a whole range of alternative strategies, the adoption of which would depend on the specific nature of the economy as well as the particular external environment it operates in.

With regard to the problem of generating exports to finance imports, it is also useful to look at the precise components of India's import requirement. The bulk of Indian imports consists of a fairly small set of commodities: petroleum and oil products, edible oils, ferrous and non-ferrous metals and fertilisers. These have accounted, on average, for more than half of India's import bill in the 1980s.[11] By contrast, machinery imports have been only 12 per cent of the value of imports on average, although this ratio appears to be growing. The point is that at least half of India's imports consists of goods for which there is substantial and growing potential for domestic production. This has been evident in the increasing substitution of domestic energy sources for imported ones, but the potential is if anything greater for the production of edible oils, which is directly affected by domestic pricing policy. Increasing domestic production in these and related areas would release foreign exchange resources for the import of machinery, including that embodying new microprocessor technology, chemicals and other goods and services which may have a direct impact on the efficiency and cost-effectiveness of domestic production.

But increasing production in such areas is directly related to the development of the domestic production and demand base. This is where the need for expansion of the home market, as Chakravarty has argued, becomes relevant. A strategy that concentrates on building up domestic production in certain crucial sectors and encouraging the growth of home demand need not be antithetical to export growth, given a judicious allocation of imports and suitable pricing policies. In fact the two are likely to be highly complementary.

The most critical advantage of gearing production to the home market rather than orienting it towards exports may well be one that has scarcely been touched upon here. It relates to the freedom which this gives policy-makers to strive for targets such as a more equitable distribution of income, reduction of poverty and improvement in the living standards of the mass of people, which may transcend the dictates of the market. It does not follow that a domestic-oriented policy will necessarily achieve any of these; indeed, such concerns themselves may appear irrelevant for the current obsession with growth. But concentration on a largely export-driven growth puts definite constraints on internal economic policies, which may leave no room for such considerations.

Bhagwati and Srinivasan castigate the Indian economic leadership of the past for failing to come to terms with these "obviously key issues". However, their own insistence on posing the problem rigidly in terms of the dichotomy of export promotion *versus* import substitution could lead to even more 'muddling under' in the Indian context. Certainly it is desirable to reconsider export policies for India and make a systematic attempt to improve export performance. But this does not require the wholesale adoption of a liberal trade regime in order to encourage exports. Nor does it imply that the fundamental need to develop the home market can be ignored in any future growth strategy.

## Notes

[I am grateful to Sukhamoy Chakravarty, Ajit Singh, Geoff Harcourt, P Balakrishnan and Ruchira Chatterji for discussions and comments.]

1 It is not immediately apparent why Bhagwati and Srinivasan dismiss questions on the relationship between South Korea's export success and its political and economic system as "non-sequiturs". Every major capitalist trading nation has found that the ability to-control wages is an important ingredient in maintaining competitiveness—and clearly this ability (or the lack of it) is related to the political and economic system.

2 The IMF analysis of the past year suggests that the present recovery may be even shorter than is believed at the present time, and prospects for future growth are uncertain. IMF (1985).

3 This is related to technical change in industrial processes, which are increasingly more economical in energy use, as well as to the declining importance of copper and other metals and the emergence of man-made substitutes for many traditional industrial raw materials. In addition there has been a shift to high technology investment in telecommunications and related areas, which straddles the industrial and financial sectors. OECD (1983).

4 *Financial Times*, March 15, 1985. It is worth noting that 1984 was the first year when debtor LDCs as a group were able to generate a trade surplus—and this after a massive export effort and drastic reductions in imports. In 1983 the combined exports of 16 major indebted countries actually contracted despite recovery in the industrial countries.

5 *Financial Times*, February 8, 1985. This has affected the performance of engineering exports in the very recent past. See "Economic Survey, 1984-85", Government of India.

6 What follows refers not only to Bhagwati and Srinivasan (1984) but also to their earlier work together and in collaboration with others such as Krueger (1973).

**LIC offers higher pensions**

LIC now offers higher pensions effective 1st April, 1985. The increase in the amount of pension will range between 15% and 20%.

The table below illustrates the increases for insured Schemes.

| Age at retirement | Pension payable | Pension secured for Rs. 1000/- payable yearly | |
|---|---|---|---|
| | | Old Rate Rs. | New Rate Rs. |
| 58 | for life—guaranteed for 15 years | 102.42 | 123.85 |
| 60 | —do— | 104.39 | 125.31 |
| 58 | for life—without guaranteed period | 113.43 | 133.34 |
| 60 | —do— | 118.38 | 137.23 |

Corresponding increases have also been allowed for pensions purchased by privately administered Superannuation Funds.

Retirement benefits of existing pensioners are also being suitably increased.

**Benefits to employer**
Under the present tax provisions, an employer's annual contribution to the LIC Superannuation Scheme is allowed as deductible business expenditure in full, subject to certain limits.

**Benefits to employee**
The employer's contribution will not be treated as a perquisite in the hands of the employee. The employee's contribution, if any, will get income-tax relief under Section 80-C of the Income-Tax Act, 1961.

Now the scheme is even more attractive than before because of the higher pensions.

# Textiles for Whom?

THE long-awaited textile policy, which was announced on Thursday, shows few traces of the prolonged study of the problems of the textile industry which is supposed to have gone on within the government, including by a committee headed by the secretary to the Department of Textiles. The policy statement itself contains the following tell-tale confession: "The textile industry has been subjected to a number of controls and regulations, many of which have become irrelevant or unnecessary with the passage of time. Such controls would be reviewed for elimination, phasing out or modification, as the case may be." Surely, such a scrutiny of the existing regulations and controls, the continuing relevance of their original purposes, their effectiveness, etc, should have preceded the formulation of a new policy. In the present case, however, as the official announcement confesses, this essential home-work has yet to be undertaken. In the circumstances the core of the textile policy announced this week amounts really speaking to a statement of the government's ideological biases and predilections.

The policy statement sets out the main task of the textile industry, quite unexceptionably, as that of increasing "the production of cloth of acceptable quality at reasonable prices to meet the clothing requirements of a growing population". This objective is proposed to be achieved by allowing the textile industry 'full fibre flexibility' as between cotton and man-made fibres; by increasing the availability of man-made fibres/yarn through increased domestic production supplemented by imports; by progressively reducing the fiscal levies on man-made fibres/yarn and on the intermediates used as inputs in their production; by allowing textile mills to freely expand and contract capacity; by permitting liberal import of textile machinery "at or near international prices", in other words, at low rates of customs duty; and treating powerlooms and mills on par and withdrawing preferential fiscal treatment of powerlooms in relation to the mills. This constitutes the core of the new textile policy and it could have been lifted, point by point, from any one of the numerous memoranda that the Indian Cotton Mills Federation, representing the textile mills, has been submitting to the government over the years.

This policy is certainly not meant to meet the "clothing requirements of a growing population". In keeping with the general orientation of the government's economic policies, it is intended to afford greater freedom to the textile industry to cater to the growing demand of the top 10 or 15 per cent of the country's population for synthetic and mixed fibre fabrics. Modernisation of the type envisaged in the policy cannot, is not intended to, reduce the cost of production; it will, on the other hand, expand the production of high-cost textile varieties the demand for which is sought to be stimulated through extravagant advertising and salesmanship. The thousands of crores of rupees which have so far been invested in the modernisation of a section of the textile mill industry have nowhere brought down cost of production or cloth prices. Similarly, while the textile industry has always alleged that high excise duties are responsible for the high prices of synthetic and mixed fibre fabrics it would be naive to imagine that a reduction in fiscal levies will bring down prices of cloth. It is interesting that even some sections of the textile industry itself do not believe that this will happen. The spokesman of the Clothing Manufacturers' Association, for instance, has disputed the claim that the new textile policy will lead to availability of cloth at lower prices. In this context it is also more than a little curious that the responsibility for production of 'controlled cloth' — "cloth at affordable prices for the poorer sections of the population", in the words of the textile policy statement—is sought to be shifted from the mills to the handlooms. When the central objective of the textile policy is said to be to make it possible for the mills to produce cloth at lower prices "to meet the clothing requirements of a growing population" and when towards this end the mills are being allowed the advantages of modernisation, flexibility with regard to fibre use and lower excise duties, why should they not produce the controlled cloth? This alone should be enough to expose which sections of the textile industry, what categories of textiles and which classes of consumers the new textile policy is intended to benefit.

The policy will, on the other hand, accelerate the displacement of labour in the textile industry—in the mills at one end and in the handlooms at the other. Reduction of employment in the mills is explicit in the emphasis on modernisation and rationalisation, on giving mills the freedom "to contract capacities", on closing down sick mills which are deemed to be unviable, etc. This is acknowledged in the policy statement in its repeated references to the need to "protect the interests of workers". Faced with the prospect of losing their jobs, what can be adequate protection of workers' interests and how is this to be secured? There is reference in the policy to a rehabilitation fund "to provide relief . . . for a limited period" for textile workers who lose their jobs. It has also been pencilled in that "displaced workers would be given priority in securing employment in other units under the same management or other industrial units in the same area". Those who know the realities of the labour market in the country will not, however, set much store by these fine sentiments. Ultimately it is the strength and vigilance of the workers' trade unions which will mitigate the costs of the new textile policy for the textile workers.

For the handloom weavers even this possible safeguard is not available. The textile policy contains nothing which is likely to stem the steady process of destruction of handlooms and displacement of handloom weavers which has been going on. The entire focus and orientation of the policy, as noted above, are quite different. True, the policy statement lists at some length as many as seven "main steps" to "preserve the unique role of handlooms", but these so-called steps are all restatements of measures which already exist on paper and which have failed to prevent the decimation of the handloom sector. And, unlike in the case of the textile mills in respect of which the textile policy at least formally acknowledges the likelihood of workers losing their jobs, there is not even a token recognition of the problem of displacement of handloom weavers in the policy. This is understandable because, as a contributor had pointed out in these columns (L C Jain, "Handlooms Face Liquidation", August 27, 1983), the phenomenon of weavers being thrown out of work is not as 'visible' or 'audible' as that of a sick textile mill. When handlooms are affected by 'sickness' the workers engaged in them become partially or largely underemployed in the first round and eventually fully unemployed. Their factories have no locks; they have no unions; they sink into penury and destitution unheard.

## *Maharashtra*

### Pre-emptive Move

THE change of chief ministers in Maharashtra this week serves to illustrate both the strengths and limitations of leaders with their own following within the Congress(I), in this case of Vasantdada Patil, and also indirectly of Sharad Pawar who intends to merge his Congress(S) with the party.

Vasantdada claims that he resigned as chief minister on June 1 because of the constant humiliations suffered by him at the hands of the Congress(I) High Command. Of late, Vasantdada's opinions have been ignored by the High Command on several occasions, such as the selection of MLCs to be appointed by the Governor, appointment of cabinet ministers and finally Prabha Rau being made the state Congress(I) president against Vasantdada's wishes, which precipitated his resignation. But he has borne worse humiliations before, especially when Indira Gandhi was in charge, to either cling to or to assume power. A classic instance in his cringing pleas to the late Prime Minister to make him chief minister again, if only for a day, after he was replaced by S B Chavan during the Emergency. So, it is difficult to accept that Vasantdada's resignation last week has much to do with honour, either his own or Maharashtra's.

It will be recalled that the Congress(I) had not fared too well in the March 1985 assembly poll, securing only 160 of the 288 seats. The High Command had reappointed Vasantdada as chief minister—though he was responsible for the poor performance inasmuch as he had selected the candidates and masterminded the campaigning—in the absence of any other leader who could hold on to the slender majority. Though the opposition Progressive Democratic Front had fared well in the election, its main constituent, the Congress(S), and more so that party's leader Sharad Pawar, faces an uncomfortable future. Pawar's popularity, like that of Vasantdada's, derives from a network of leaders and their followers at various levels in the state cemented together by political power. The lesser leaders, who mobilise the votes, support Pawar (or Vasantdada) with the expectation that they will move the government machinery to meet their need for irrigation facilities, loans, electricity connections, licences, co-operatives, and so on. Thus it was not surprising that as many as 49 of the 55 MLAs elected on the Congress(S) ticket in 1980 soon switched over to the Congress(I) since Pawar, their leader, being in the opposition, could not deliver the fruits of power.

Pawar is apparently aware that a similar exodus of his MLAs into the Congress(I) might again occur; the Congress(S) presently has a strength of 60 in the legislature. This likely eventuality will be a serious blow to Pawar's clout in the state since it would take him a stupendous effort to rebuild his party once again and wait for the uncertain outcome of the next assembly contest, five years away. Hence it is that this time Pawar himself has been keen on merging his party into the Congress(I), ostensibly to revitalise what he calls the 'Congress culture', which is nothing but a vague concept. The Congress(I) High Command too seems to be keen to bring in Pawar not only to rejuvenate the party in Maharashtra but also to fracture the opposition at the national level, in which Pawar played a prominent role till recently.

Pawar had usurped the chief minister's post in 1978 by disloding Vasantdada, and thus sparked the feud between these two Marathas from western Maharashtra who dominate the state's politics. Vasantdada apparently sensed that the Congress(I) High Command was planning to shortly replace him with his foe Pawar. So before Pawar's entry into the Congress(I) could crystallise, Vasantdada sought to pre-empt the High Command's intended move against him by resigning and ensuring that Shivajirao Nilangekar-Patil was elected the new chief minister by all the MLAs. Nilangekar-Patil is also a Maratha but from the backward region of Marathwada. Pawar, when he does join the Congress(I) will find it hard to dislodge the newly and unanimously elected chief minister, and that too a Maratha from a backward region. Vasantdada's domination of the state's politics will continue at least for a while through Nilangekar-Patil, his appointee. Ironically the Congress(I) High Command has had to swallow the humiliation of accepting as the new chief minister, a man who was denied the party ticket for the assembly elections on the ground that the party had lost in his assembly segment during the December 1984 parliamentary poll.

## *Punjab*

### Opportunity for Government

THE present situation does seem opportune again for pushing towards a stable solution of the Punjab conflict. But the question is whether the Congress(I) government at the centre will rise to occasion.

The first anniversary of the army assault of the Golden Temple passed off peacefully this week, barring stray and minor incidents. One likely factor behind the current 'silence' of the terrorists could be the fall out from last month's senseless transistor bomb killings of innocent persons in north India. These pre-planned explosions of May 10 seem to have precipitated a strong revulsion against terrorist methods amongst non-Sikhs so far sympathetic to Sikh grievances. On the other hand, within the Sikh community itself, moderate opinions appear to have gained wider acceptability, especially since the reprisals, hoped for by the terrorists, did not occur. Realising the failure of their attempt, the terrorists did not plan any further killings this week.

The predominant issue within the Sikh community at the moment is the tussle for leadership and popular support between moderate and extremist groups. The extremists, notably of the All India Sikh Students Federation, seem to be functioning through the 'United' Akali Dal set up recently by Baba Joginder Singh, the father of J S Bhindranwale. Pro-Khalistan slogans were reportedly raised at the group's convention held at the Golden Temple complex on June 6. But apparently the moderate leaders H S Longowal, G S Tohra and P S Badal, continue to command a greater following. This is reflected from the pressure successfully exerted, by 23 of the 36 Akali Dal MLA's and most of the party's office bearers, on them to continue as chiefs of the Dal, the Shiromani Gurudwara Prabhandak Committee, and the legislature party, respectively.

While no doubt the extremists partly derive their strength from the support of Sikhs abroad and from Pakistani officialdom, the fact remains that its basic sustenance wells up from the continued sense of fear and humiliation of Sikhs inside the country. For instance, even Jathedar Rachpal Singh, who heads a Dal splinter which has the Prime Minister's attention to the false implication of innocent Sikhs in the transistor bombs case.

The Union government has ordered a number of economic measures for Punjab: chiefly a Rs 200 crore coach factory to be set up in a couple of years and concessions/incentives to industries in Amritsar district. While these are welcome, immediate political initiatives are more necessary to firmly root the current mood of moderation amongst the Sikhs. Some of the Sikh demands ought to be unilaterally conceded: mainly the release of all political detenus, withdrawal of the numerous Acts curbing civil liberties in the state and leniency towards the Sikh soldiers who deserted the army last June on hearing of the assault on the Golden Temple. This will create an environment conducive for initiating talks with the moderate leaders.

But Rajiv Gandhi's government—apart from hoping to decimate the Akali Dal to suit the Congress(I)'s own ends in Punjab—seems to be in a way paralysed by the Hindu sentiment in north India which brought it overwhelming victories in the last parliamentary and assembly polls. So the government does not seem to have the courage to push on with a long-term strategy in the state, due to fear or in deference to the Hindu backlash which surfaces whenever Sikh terrorists strike to basically scuttle the reconciliation moves of the Akali moderates. Of course, legitimate sounding excuses—like the Akali Dal's endless list of demands and lack of a clear leadership in the Sikh community—are put out by official spokesmen, including at present for the government not taking the initiative as it ought to be doing.

## *Bangladesh*

### Political Parties' Failure

*A Correspondent writes:*

TWENTYONE people killed, hundreds wounded, hundreds arrested. These are the results of the massive malpractices and numerous clashes between supporters of competing candidates which marked the upo-zilla (sub-district) elections in Bangladesh from May 16 to 22. So there was obviously no boycott, in spite of the call by the three opposition political fronts. The opposition had managed upto now to prevent the military government from holding any election without first lifting martial law, but this time it failed, even though the 12-hour general strike on May 13 had been a partial success. Since March 1 all political and trade union activities have been banned, strict press censorship has been imposed, and all universities have been closed *sine die*. Hundreds were arrested all over the country, yet the boycott of the referendum on March 21 was a success: less than 10 per cent actually voted. General Ershad, desperately looking for some legitimacy, was resorting to this last trick to get an embarrassingly high 94 per cent 'yes', which showed how much pressure had been put on the bureaucracy, the police and the army to obtain the much wanted 'popular support'.

What happened between the referendum and the upo-zilla elections? Many more arrests took place and hundreds were picked up from the crowds celebrating Independence day on March 26. All opposition political and trade union leaders are today either in jail or underground (Sheikh Hasina, leader of the Awami League, and Khaleda Zia, leader of the BNP, have been under house arrest since March 1). The opposition movement has been halted, cut off from its mostly upper class leaders who do not seem interested in facing more repression nor may be in really challenging the *status quo*. The political parties seem to have lost public support, after having repeatedly failed to propose a programme to challenge the military government, while the trade union front may have lost interest in the struggle.

The referendum was meaningless to the people: even if there is a lot of discontent and opposition against the military government there does not seem to be a clear political alternative. The opposition is divided in three fronts which have different stands on the constitution and the political system. The Awami League has a long record of opposition to Zia's and Sattar's BNP governments. BNP's Khaleda Zia is, however, more opposed to Ershad himself than to the military regime, as she suspects that he had something to do with the killing of her husband. In short, the opposition is together only in its opposition to Ershad's rule.

On the other hand, electing the chairman of their new upo-zilla council, even if his power is still vague and uncertain, meant something to the people. The upo-zilla councils are a crucial creation of the military government, obviously to establish a power base which will compete with the political parties from the bottom—a policy similar to the late Ziaur Rahman's 'gram sarkars' (village governments) to destabilise the traditional union councils. The upo-zilla councils have been each promised one crore takas, and the upo-zilla nirbaho officer (chief civil servant at the upo-zilla level) already has discretionary power over eight per cent of the development budget in his area. The decentralisation process, from districts to subdistricts, has led to a huge expenditure which has benefited contractors as much as the local elite and a part of the bureaucracy.

Ershad's government had planned upo-zilla elections as early as May 1983, but had to cancel them under the pressure of the opposition. Two years later, with a much more severe martial law imposed on March 1, 1985, Bangladesh is back to square one.

This failure of the opposition is in contrast to its success in the last two years. The movement started with the students in the vanguard, as so often in Bangladesh politics. In February 1983 the students had to face brutal repression—50 of them were killed and thousands arrested and tortured. In 1982 the trade unions had formed a front with the participation of all the main federations except the pro-government and corrupt Sramik League (also funded by the Asian American Free Labour Institute, believed to be a channel for CIA funds) and, together with the student front, they have been the real force compelling the political parties to press the army for a return to democracy. On as many as seven occasions the government had to either cancel or postpone elections as the opposition refused to participate. The opposition stuck to its strict 'no elections under martial law' position, even after several concessions by the government which had hoped to hold parliamentary elections in April last year.

On October 14, 1984 the three opposition fronts—the 15-party alliance led by the Awami League, the seven-party group led by the BNP, and the Islamic parties—had organised massive rallies in Dhaka. In spite of desperate government efforts to sabotage the initiative—ferries and trains were suspended to prevent people from travelling to the capital—more than 500,000 people demonstrated against the junta's dictatorship. The government then imposed strict censorship on the press. Newspapers responded by not coming out at all the following day. In the last two years a number of hartals (general strikes) have been successfully organised, the most remarkable one being the 48-hour general strike on Decem-

ber 22 and 23, 1984, which attracted massive support in spite of unprecedented police and army mobilisation.

The political parties have, however, failed to bring out a programme to take the struggle further. The government has been conscious that neither the Awami League nor the BNP, and probably many other parties as well, really wanted a confrontation. The main political forces have been leading the movement half-heartedly, basically because the trade unions and the student fronts plus minor political groups have been compelling them to do so. A massive non-cooperation movement had been announced to start in December 1984, but it never got off the ground. In May 1984 an agreement was reached between the government and the trade union front. The inducements offered to the latter were substantial: over 60 per cent pay rise from July 1984 (though this was mandatory only for government employees) and favourable changes in labour laws which were, however, formulated at long last only in March this year, days before the referendum (ironically at a time when all trade union activity was banned).

It is difficult to predict what will happen next. The government may well call for parliamentary elections in the next few weeks. Will Ershad then permit political and trade union activity again, or will he choose the Pakistani way? The universities cannot remain closed indefinitely, and we may be quite sure that the students will not forget the traditional and important role they have always played in Bangladesh politics. There is also a possibility of a coup: in early May Ershad narrowly escaped another attempt on his life which killed two people in his car (though nothing of this was reported in the local press). But this would only make for fights inside the junta with not much disruption of the regime itself.

The present political vacuum is a disaster for the development of poverty-stricken Bangladesh. During the last 25 years the country has been under martial law for more than two-thirds of the time. Foreign aid, coordinated by the World Bank and the large donors, is equal today to almost half the country's budget. It keeps the urban well-off happy and comfortable—among them many political leaders and the higher echelons of the army. Why should they want a real political change?

## BUSINESS

# Stock Market's Homage

THE stock market has continued to display remarkable strength. The upward trend in equity prices which commenced early in November is still in progress. The first week of June, in fact, witnessed one of the sharpest rises for any single week—the sharpest-ever perhaps. The current bull phase has no parallel. The *Financial Express* equity price index for Bombay has risen by 63 per cent since the beginning of November and the all-India index has moved up by 58.4 per cent. Between January 2 and June 7, the Bombay index has gone up by 51.5 per cent and the all-India index by 50 per cent. This far exceeds the total rise during the preceding three years. The rise from 1982 low to 1984 high works out to 39.6 per cent in the case of Bombay index and 33 per cent in respect of the all-India equity price index.

The phenomenal upsurge in equity prices has baffled not only economic experts and political pundits but even the shrewdest market observers fully conversant with the various aspects of the functioning of the stock market. The Union finance ministry is known to have expressed considerable concern over the goings on on the stock exchanges and instructed the chiefs of the four major exchanges to take effective steps to contain speculative activity within manageable limits. A series of measures have been taken over the past several weeks— mostly at the instance of the Finance Ministry—to enforce strict discipline on the market. These measures included suspension of trading, restricting trading to squaring-up of outstanding commitments, transfer of shares from the 'specified' to the 'unspecified' list and margins of all kinds—daily margins, special margins on volatile scrips, margins on carry-forward business, margins on the total volume of a member's business and automatic margins in the event of rise in the price of a share exceeding a specified percentage.

The imposition of various margins has resulted in a sharp decline in the volume of business and considerably increased the clerical work for maintaining detalied accounts. The stockbroking community in Bombay has of late been feeling greatly exercised over the harsh impact of the rigorous margins. Not many stockbrokers command the requisite financial resources to carry on normal business if they have to strictly comply with the margin rules. This underlines the need for strengthening the organisational framework of the stockbroking profession. There is no good reason why members of the exchange should be allowed to undertake risk which is beyond their resources. This is not to suggest that the margin system should not be suitably modified to encourage and ensure normal market operations. Smarting under the rigours of the complicated margin system introduced at the instance of the Union Finance Ministry, stockbrokers in Bombay have been thinking of boycott of trading to seek suitable modifications in the margin system. Worst affected are the stockbrokers who thrive mainly on speculative activity. Brokers who deal mainly in cash shares are strongly opposed to the idea of suspension of trading which has the effect of undermining investors' confidence.

The margin system has no doubt seriously affected the volume of business but it has had no effect on equity prices which have recorded a spectacular rise since about the middle of May. The runaway boom in equity prices as also the overwhelming public response to new issues reflect investors' growing confidence in the dawn of a new era for the private corporate sector. Investors have apparently been encouraged by the various measures taken by Rajiv Gandhi's government to create an environment in which the business community can fully exploit its initiative and entrepreneurship. The new textile policy for instance contains all that the organised mill sector could have hoped for. The pharmaceutical industry seems mighty pleased with the delicensing of a large number of essential and mass consumption bulk drugs and formulations. The stock market is greatly impressed by the rapid pace at which the economy is being liberalised. This indeed is the major factor behind the phenomenal boom in equity prices. The boom in eqity prices has, of course, been considerably aided by the shortage of floating stocks of good shares because of large institutional holding. Several shares are currently commanding scarcity value, unrelated to the prevailing yield structure as well as growth prospects in the near future. The stock market bulls seem to have taken too much for granted. They are not much bothered by the Planning Commission's concern over the poor performance of the four key infrastructural sectors—power, irrigation, railways and roads—during the Sixth Plan. Infrastructure facilities have an important bearing on the general economic tempo. The prevailing mood of the stock market is one of reckless optimism.

## *Engineering Industry*

### Export Hopes Belied

THE provisional estimates of the value of engineering exports during 1984-85 have once again belied the hopes of achieving a breakthrough in ending the prolonged stagnation. In the third quarter of 1984-85, it was hoped that the export target of Rs 1,500 crore fixed for the year would be achieved thanks to the increased purchases by the Soviet Union. However, according to the final estimates now available, export earnings of the industry during 1984-85 have amounted to no more than Rs 1,300 crore.

The target of Rs 1,500 crore, it may be noted here, had been earlier set for 1983-84. However, actual exports in 1983-84 registered a decline of 6.4 per cent to Rs 1,170 crore from the previous year's level of Rs 1,250 crore. Even the growth of 11 per cent registered in 1984-85 is deceptive as it was mainly brought about by the sharp appreciation of the US dollar *vis-a-vis* the rupee. Approximately 40 per cent of our export earnings are in terms of dollars.

The poor performance of the engineering industry on the export front has been attributed mainly to inadequate export effort of the large engineering units (the DGTD units) which have been the biggest beneficiaries of the government's liberalised import policy. With a few exceptions, the export performance of the top 100 engineering companies has been far from satisfactory.

It may be recalled that as recently as October 1983, the Engineering Export Promotion Council (EEPC) was talking about a target of over Rs 9,000 crore worth of engineering exports by 1990-91. Of this, 50 per cent was to consist of capital goods and turnkey projects. But by June 1984, the outgoing chairman of the EEPC had already scaled down this figure to Rs 6,000 crore without offering any explanation for this drastic deflation. More disappointingly, even the achievement of this lowered target now appears to be wishful thinking, looking at the trend of exports during the past few years.

Even now there is hardly any effort on the part of the industry to make a proper assessment of the situation and formulate proper strategies to reverse the trend. The Engineering Export Promotion Council (EEPC) and the Association of Indian Engineering Industries (AIEI) continue to vie with each other in making tall export projections for the future. While the EEPC has provisionally fixed an export target of Rs 1,725 crore for 1985-86, the AIEI has set a target of Rs 3,000 crore for 1987-88. However, they have not given any indication as to how these targets are likely to be achieved in the light of the dismal performance in the past three years. Industry sources have offered routine excuses for the poor performance on the export front, namely, global recession, shrinking of West Asian market, the payments problem in Africa, growing counter trade, protectionism in the West, etc.

The industry would do well to examine how many of these are genuine reasons and whether it anticipates a change for the better in these conditions to warrant its optimism for the near future. The more important reasons for the dismal performance appear to be the relatively lower growth in the domestic production of engineering goods during the last few years and the high cost of production. Moreover, in spite of a series of export promotion measures such as liberal imports of capital goods and raw materials, new technology, cash compensatory support, supply of inputs at international prices, etc, there is no sense of commitment on the part of even the larger engineering companies to increasing export sales.

According to estimates, the government's total foreign exchange spending on the engineering industry by way of import of technology, capital goods and spares has gone up to three times its export earnings. Also, the value of imports of engineering goods exceeded the value of exports by Rs 4,400 crore during 1983-84. While the export earnings of the industry have grown three-fold between 1974 and 1984, foreign exchange outgo on the imports of engineering goods increased by four fold over the same period to Rs 5,558 crore in 1983-84. In effect, we have been spending more and more foreign exchange to sustain the same level of export earnings.

## *Pharmaceutical Industry*

### Paper Policies

GOING by recent experience, the proposed new drug policy—which has been long delayed due to conflicting pressures exerted by lobbies of multinational and Indian firms—can hardly be expected to help attain its objectives. In this context the findings of an official analysis of the extent of implementation of the prevailing policy are significant. The study has reportedly found that many key provisions of the policy, announced over seven years ago, have not yet been put into practice.

Some of the ignored provisions of the 1978 policy concern the basic goal of pushing towards greater indigenisation of the industry. Specifically, one such measure stipulates that gross profits of a firm beyond 8 to 13 per cent are to be collected separately for such purposes, including research and development, as may be notified by the Union government. Then, multinational firms with a turnover of over Rs 5 crore, were to be obliged to set up R and D facilities in the country. Capital investment in these facilities was to be at least 20 per cent of a firm's net block, and four per cent of the total turnover was to be spent as recurring annual expenditure on R and D. Also, the policy had stated that a Bill would be introduced to levy a cess of upto one per cent of the value of goods produced which was to be pooled together for centralised R and D purposes. The bill seems to have been forgotten.

A further set of provisions, pertaining to the equally basic objective of cheap and easy availability of quality drugs, also seems to have been overlooked. These pertain to fixing the prices of intermediate drugs, controlling the prices of eight critical intermediates and appropriately expanding the list of such crucial chemicals. Similarly, a stipulation that 20 per cent of the turnover of a firm would have to be compulsorily accounted for by essential bulk drugs and another calling for enlarging, rationalising and decentralising the drug distribution system through the public sector have been ignored. The study also admits that nothing has materialised of the move to encourage foreign firms to offer quality control facilities to the small-scale sector on a no-proft, no-loss basis. So far even the laboratory for testing sera, vaccines and immunological products, as announced in the policy, has not been set up.

The study reportedly argues that non-implementation of the policy measures was because of the preoccupation with physical controls coupled with the failure to take account of some crucial laws. However, it is difficult to see how the desire for physical controls could have hindered implementation of the measures mentioned above, especially when some of them would also involve physical controls. Existing laws might be a barrier; for instance, the provision for collecting excess gross profits for R and D may contravene the Companies Act. But surely these laws could suitably be amended.

In such circumstances it would not be incorrect to conclude that the twin objectives of indigenisation and cheap, easy availability—which are claimed to be foundation of India's overall industrial development policy—are included more as platitudes than with any serious intent in the drug policy. It is very likely that the new drug policy would again prominently mention the ignored provisions while its operative part will largely be geared to sorting out the competing interests of the various manufacturers.

# Enough Is Enough

**Romesh Thapar**

AS Rajiv Gandhi returned to his tense land and pulled on his bullet-proof jacket, the security afforded by an authoritarian structuring as in the USSR must have felt attractive. It is all very depressing. We have made our very own future terribly dependent on personality cults—and, therefore, in the calculations of lumpen terrorism dressed in religious or ideological garb, easily assaulted by hit-lists and transistor-bombs.

However, the cult-pushers keep working overtime. The vulgarians of the CPWD, those aesthetic illiterates who have despoiled our landscape with the worst left-overs of colonial housing and such like, have just announced an international competition to select sculpted larger than life size figures of Jawaharlal Nehru and Indira Gandhi. Selected miniature models will win 25,000 dollars each! This is so typical of the irrelevances we indulge in these days.

I will not ask who sanctioned the funds. We are playing games of waste at every level, and particularly around the propagation of a dynasty. I am concerned about this sculpted thrust, violative of past decisions, and of the persons who will be called upon to give their verdict on the various idols-in-the-making—the Pupul Jayakars, the Narayana Menons, the Karl Khandalawalas, the Mohamed Yunuses and the Laxmi Sihares or Kapila Vatsyayanas who are now involved in what looks like a free-for-all over the Festival of India preparations with words like 'liar', 'trouble-maker', 'racketeer' thrown in to enrich expression.

I know the mechanics of the sculpture obsession. There's plenty of money on it. Expertise, talent, sponsoring, even aesthetic opinion, will be for sale. Clearly, we are on the edge of another 'artistic' controversy—you know, like the dancers who have hogged patronage for the past quarter century and see no reason at all why they should not continue to do so. Imagine the ballyhoo we are in for as our sculptors get cracking on their tiny interpretations, or shall I say imitations from past ages.

If the vulgarians of the CPWD had bothered to consult the records of the Jawarharlal Nehru Memorial Trust, they would have discovered that a very clear-cut decision was taken to avoid sculptured figures, and to immortalise the thoughts of those whom we are anxious to honour on rocks all over the country. The first rock was established in Teen Murti House. Active in these decisions was Indira Gandhi, admittedly before she became dynasty-conscious.

Who took the decision to change these enlightened guidelines designed to destroy the latent personality cult in all of us? Rajiv Gandhi operating *sotto voce*? Or Works Minister Abdul Gafoor, curying favour in the usual sort of durbari way? Or those creatures competing for cultural czarism even as they abuse each other and intrigue against each other? Or is there a shadowy ministerial figure masterminding this disarray?

At this moment of writing, another 'memorial' has opened in the Capital. Indira Gandhi, who was so upset about a colonial type Teen Murti House, a haven for British C-in-Cs, being converted as a national tribute to her father because the Sastri family refused to take up residence there on the plea that all the necessary religious rites had not been performed, must be wondering why her wretched Safdarjung Road house should symbolise her. Let us remember that she was only too ready to move back to Teen Murti House even after it had been dedicated to the nation!

This business of turning houses into memorials sets a terrible style. At this rate, it does become possible for all manner of political flatterers and fawners, the competing factionalists within opposition formations, to suggest wider take-overs in the interest of the only 'history' they are familiar with. But what holds back the protest of those who know better? Have we, as the articulating, influential elite, become totally conformist, without courage or conviction?

I shudder to think of what will become of that portion of Ring Road, fronting the Red Fort along the Yamuna, where all the 'ghats' are being located. Already, the unread and insensitive call it 'Death's Row'—and the power station belching its smoke is quite a landmark. Think of the possibilities for all the empty netas and the shallow dynasty-builders (for they, too, are quite numerous) plotting their 'ghats' amidst the tree-covered acres. They could belong to lower castes, other unclean faiths. Then what? Righteous rioting?

It is unfortunate that these ridiculous dimensions have to be underlined to drive home the point that we are failing to grow up as a modern nation (the twenty-first century, my foot!), that we are living at the level of the vulgarians pushing their way to political favour whatever the irreparable damage to our sensibilities. Enough is enough, and it is about time that pressure was mounted in Parliament and legislatures, and in Opposition conclaves, to persuade the ruling coterie to oppose this cultism. It is contrary to the democratic spirit. If we don't recognise this, we might start embalming bodies *a la* Lenin.

Frankly, I cannot help wondering what the public reaction is to all these obsessions in this troubled land. If this is political education in the style of those nations who are for ever titillating their peoples with patriotic inputs, I think we should think again about our rather stupid priorities. A great deal of money is going into these side-shows. Even the fellowship scheme of the Jawaharlal Nehru Fund keeps pumping money into academia's mundane 'research' from a fund that the ordinary people of India helped to gather. It was not intended to be dissipated in this fashion year after year. Academia has enough fellowships and funds to play with.

Everything we attempt is turned into some sort of ugly vested interest, without principles and without perspectives. Change is resisted even though it is a convenient election catchword. The leading factotems cannot do otherwise, for they too seek to perpetuate their positions and the patronage invariably built into these infrastructures. Bad habits and bad precedents are infectious. Not a single political formation is really anxious to return us to healthier norms.

I wonder if the ruling coterie even understands what is being said. The treatment meted out to the Chief Minister of Maharashtra by Rajiv Gandhi is indicative of the worst kind of feudalism. A Chief Minister has to be treated as a Chief Minister, not as someone to be punished by denying an interview. The repercussions of these intolerable behaviour patterns will become clear very soon. And, alas, there is no one around to remind Rajiv Gandhi that he is a democratic Prime Minister, not a hereditary Congress chieftain (whatever that might mean!).

*May 31.*

# Farce of Fund Surveillance

### ISG

THE Bonn Economic Summit of the industrialised countries of the West has, as we know, been conspicuous for its failure to agree on almost any major issue. It could not agree on the timing and agenda of the next round of negotiations on trade or on the participants in it. Nor could it agree on the discussion of the reform of the monetary system. As it turned out, differences were quite sharp on both the issues of trade as well as money, but they were clearly sharper on money.

What is so different about the agreement reached at the IMF's Interim Committee meeting towards the end of April this year that "effective Fund surveillance was necessary as a means of promoting sound economic policies and convergence of performance among member countries", that "steps be taken to strengthen surveillance over the policies of all Fund countries", and that in that context consideration be given "to means of increasing effectiveness of surveillance over the policies of those industrial and developing countries which have a significant impact on the functioning of the world economy"?

On the one hand was Ronald Reagan of the United States declaiming the virtues of the free market everywhere, including the international currency market, and refusing to see the need to rein in the latter to curb fluctuations in exchange rates. On the other hand was Francois Mitterand of France arguing for urgently convening a Bretton Woods type of conference that would consider restructuring the whole monetary system so that exchange rates did not fluctuate beyond certain limits. The French called for the establishment of 'target zones' for exchange rates. In the end, what the Summit could agree upon was to affirm the need "to improve the functioning of the international monetary system" and in that context note that the Group of Ten would soon be considering the report of a study on this subject and forwarding proposals for the consideration of the IMF Interim Committee in Seoul, South Korea, in October 1985.

Evidently, a distinction was sought to be made between 'improvement' in the monetary system as opposed to its 'reform'. The implication of this distinction becomes clear in the light of the reported conclusions of the G-10 study referred to in the Summit declaration. Although the report of the study will not be made public until the June meeting of G-10 finance ministers, the conclusion of the study that "no major reform of the monetary system is necessary", despite its various imperfections including its inability to control the volatility of exchange rate changes, has been known for some time, thanks to officials of the US Treasury. Much more recently, it has been disclosed through the US press that the major improvement the study calls for is that the IMF be given "a somewhat more visible role" in advising on economic policies. In this connection, the study suggests three steps: (1) the Fund Managing Director to urge all countries to adopt policies to promote monetary stability; (2) the Fund to devote a separate chapter in its annual World Economic Outlook to reviewing the policies of the major industrial countries and their impact on the world monetary system; and (3) the G-10 Finance Ministers to have a prior opportunity to review the conclusions of this chapter.

This brings us back to the question with which we started, namely, the difference that this agreement to have the Fund exercise effective surveillance on the economic policies of all countries, including the major industrial countries, and not just the developing countries and other countries who have to resort to the Fund for financial cover, would make to the existing world monetary situation. To put the record straight let us start by making it clear that surveillance of economic policies of members has all along been a function of the Fund. It was specially underscored at Jamaica in January 1976 when a sort of *ex post facto* stamp of approval was affixed on the system of floating exchange rates that had come to stay already. The Jamaica agreement in enjoying upon member countries to collaborate with the Fund and other members to ensure orderly exchange arrangements and to promote a stable system of exchange rates, asks the Fund not only to exercise "firm surveillance over the exchange rate policies of the members" but also to "adopt guidelines" with respect to these policies. Let it be noted that when the Jamaica agreement spoke of "firm surveillance" by the Fund, it had in mind all the member countries, including the industrial countries. That it was indeed so came out graphically in the testimony of the then US Treasury Secretary, Bill Simon, before a Congressional committee, while recommending acceptance of the Jamaica agreement that acceptance by the US of firm surveillance by the Fund of its exchange rate policies did not imply that should it be decided by an 85 per cent majority to return to a fixed exchange rate system, "the United States can be required to establish or maintain a par value for the dollar".

The problem has been that the Fund has exercised no surveillance worth the name in actual practice. If it had, it ought to have come out sharply against the enormous accumulation of dollar liabilities abroad, both official and through US commercial banks, because it is the existence of these enormous dollar holdings abroad which is the single largest factor behind the volatility of exchange rates now. But firmness or effectiveness of surveillance, by whatever name one now chooses to call it, depends on the enforceability of the findings of the surveillance. Although the then US Treasury Secretary drew the line at reversion to the fixed exchange rate system, in actual practice the Fund's surveillance of US exchange rate policy, or the absence of it, has had virtually no impact whatsoever on US policies.

Let us face it, the reason behind the virtual impotence of Fund surveillance so far has been that the surveillance has had no teeth, when it came to non-borrowing members, particularly a member as powerful as the United States.

Supposing the Tokyo meeting of G-10 finance ministers accepts the recommendations of its study and supposing furthermore that the Fund's Interim Committee adopts the proposed formula for effective surveillance, would it lead to any major change in the existing situation? What additional teeth does the new formula give to Fund surveillance to enable it to enforce its conclusions on member countries? The publication of a separate chapter in the World Economic Outlook? Could there have been a bigger joke?

# Good Performance Likely to Continue

**Hansavivek**

*SOUTHERN PETROCHEMICAL INDUSTRIES CORPORATION (SPIC)* is expanding and widely diversifying its activities. It is seeking permission to set up plants for manufacture of 900 tonnes of ammonia and 1,500 tonnes of urea per day at Tuticorin at a cost of Rs 400 crore. A letter of intent for increasing the capacity of the DAP I plant has been received by the company and is being taken up for implementation this year. The capacity of the plant will increase from 500 to 850 tonnes per day. The erection of the gypsum board pilot plant is in the final stage of completion. This would enable the company to find alternate use for the by-product, gypsum, produced by the phosphoric acid plant. At present the company is importing about 1.2 lakh tonnes of phosphoric acid in addition to its own manufacture to meet the requirements of DAP production. With a view to regulating the delivery pattern from various overseas suppliers so that its production is not affected, the company is considering purchase of a ship for about Rs 15 crore for carrying phosphoric acid. Clearance from the Central government in this regard is awaited. The implementation of the fluorine recovery plant as a means of pollution control and as an intermediate for by-product manufacture is in an advanced stage and is expected to be commissioned this year. This will be followed by the implementation of the aluminium fluoride project for which clearance for import of components of machinery is awaited from the government. Work on the 18 MW captive power plant is in progress and the unit will be operational by end 1985. This will ensure 100 per cent availability of power for existing plants at Tuticorin. The Tamil Nadu Industrial Development Corporation has chosen the company as a joint promoter for a Rs 130-crore linear alkyl benzene (LAB) project to be located at Manali, Madras. The company will be investing 25 per cent of the equity capital of the new joint sector company 'Tamil Nadu Petroproducts' which will implement the project. The company also proposes to increase its equity share to 25 per cent in Alkali Chemicals and Fertilisers. A new company under the name 'SPIC Electronics and Systems' has been registered to implement a Rs 10-crore project for the manufacture of magnetic tapes. SPIC has taken over, subject to clearances by statutory bodies, on lease the ailing furfural unit of Southern Agrifurance Industries. Various schemes are being considered to put the unit back on the rails.

| Wages/sales | | 1.64 | 1.98 | 13.04 | 11.85 | 20.12 | 21.31 |

SPIC has turned in impressive working results for 1984 with gross profit increasing from previous year's Rs 28.32 crore to Rs 48.65 crore following a rise in sales from Rs 285.11 crore to Rs 502.51 crore. Although tax liability has taken away much more, net profit is substantially higher at Rs 24.61 crore compared to Rs 13.75 crore. Dividend has been stepped up from 10 per cent to 20 per cent and is covered 7.20 times by earnings as against 7.02 times previously. Production in urea, DAP I and DAP II plants exceeded 100 per cent capacity utilisation while the ammonia plant achieved 90 per cent of capacity use during the year. The company had to encounter shortages of raw materials like sulphur and rock phosphate. Shortage of own phosphoric acid was offset by increased imports. The company continued to market imported fertilisers. It handled a record quantity of 1.17 million tonnes of imported fertilisers against 0.32 million tonnes in 1983. The efficient handling of fertilisers at major and minor ports with equal ease won acclaim for the company from the Ministry of Agriculture and also from other agencies and institutions. The company exported 15,555 tonnes of phosphate-gypsum, a by-product, to Sri Lanka.

The R and D activities of the company continued in the areas of better granulation techniques as applicable to fertilisers (NK grades), various recovery experiments to reduce level of ammonia, chromate, urea in effluents and incorporation of micro nutrients and utilisation of by-products. It is also proposed to set up an R and D Centre near Madras with the specific object of developing basic drugs and pharmaceuticals. The other areas of activities planned at the Centre are in the renewable sources of energy, molecular bio-sciences and bio-technology and electronics. The total amount spent on R and D was Rs 93 lakh. Frederic J Heredia was co-opted as a director by the board with effect from March 26, 1984. G Dwarakanathan was re-appointed as Vice-President (Finance) for five years from May 28, 1984. The technical expertise gained by engineers and technicians has been pooled to form a new group to render services in the field of maintenance, installation and commissioning. It has already attended to jobs at the fertiliser units of IEL, RCF, FACT, NFL, etc. In addition, construction and commissioning jobs have also been performed successfully. Commenting on the current year's outlook, the directors say that it depends upon the improvement in the power situation in Tamil Nadu, which is already suffering a severe cut since February last. Given an early monsoon and improvement in power availability, the company should do equally well this year too.

*SANDOZ* has experienced a marked contraction of margins during 1984. It earned a lower gross profit of Rs 4.27 crore against Rs 5.63 crore in the previous year despite increase in sales from Rs 56.77 crore to Rs 63.03 crore. With a sizeable saving in tax liability, however, net profit has turned out to be higher at Rs 1.94 crore (Rs 1.28 crore), Dividend has been raised by 2 points to 14 per cent which is covered 3.08 times by earnings as against 3.05 times previously. The directors attribute decline in gross margins to the cumulative effect of competition in the market, all round increase in costs of inputs, sluggishness in certain sectors of industry and labour unrest. With the increase in cashflow, the company was able to meet the entire capital expenditure and incremental working capital requirements from internal sources. The company established a 100 per cent export-oriented agrochemicals manufacturing unit within a record time in the Kandla Free Trade Zone. Despite stiff competition, it achieved exports of Rs 7.73 crore against Rs 1.89 crore in 1983. The major exports were of pharmaceuticals and agrochemicals. Sales of leather chemicals registered satisfactory increases. Continued price control, and in certain product groups price reduction, slowed the pace of growth of the pharmaceuticals industry.

The company revived the marketing of Hydergine ampoules, a product used in emergency situation for brain function revitalisation. An industrial licence for the manufacture of clopamide, a diuretic drug, was received during the year. The agrochemicals division had to contend with stiff competition from both large-scale and small-scale units in certain segments. Moreover, non-availability of certain raw materials and relatively sharp price increases in packing materials and petroleum based chemicals eroded profitability considerably. A section of workmen resorted to go-slow which affected production and sales of all the three divisions. In December last, the two unions conducted a secret ballot to resolve the impasse created by their rival claims. Since neither union achieved the required majority in terms of the agreement reached between them earlier, representatives of both the unions have commenced joint negotiations with the management for long-term settlement of workmen's demands. J N Banerjee, Chairman, has welcomed the Central government's programme emphasising its commitment to faster growth through higher productivity and of seeking to place a premium on better management and performance. This has aroused an expectation that there would be a gradual dismantling in the plethora of controls and a speeding up in the granting of approvals. Meanwhile, the company is pursuing its plans for backward integration in pesticides and for the manufacture of chemicals for the leather processing industry.

*ENNORE FOUNDRIES* has fared well during 1984. It was able to achieve record sales of 20,635 tonnes against 15,054 tonnes in the previous year due to improvement in market conditions, a favourable power situation and progressive utilisation of high pressure moulding line. Turnover increased from Rs 20.03 crore to Rs 26.98 crore and gross profit from Rs 2.60 crore to Rs 3.34 crore. With no tax liability in both the years, net profit amounted to Rs 127 lakh (Rs 79 lakh). The directors have maintained dividend at 15 per cent and recommended payment of one per cent extra as a special silver jubilee dividend. The distribution is covered 1.76 times by earnings as against 1.16 times previously. The directors state that the year's results include benefits from the modernisation and replacement scheme which was completed in 1983, and its impact would be much greater in the coming years. Areas for inducting improved technology are being identified for progressive implementation in the coming years. The company incurred an expenditure of Rs 12 lakh during the year on R and D activities. The main thrust in R and D continues to be in achieving basic objectives of improvement in quality, lowering of costs and introduction of alternate materials and processes. R J Hancock, director, resigned on April 30, 1984 and D R G Andrews was co-opted in the casual vacancy thus caused. P D Plant, another director, resigned on February 1985 and C J S Woodwork was appointed as an additional director.

# Muslim Personal Law

## Questions of Reform and Uniformity Be Delinked

**Balraj Puri**

IN an otherwise well reasoned ruling on the right of maintenance of a divorced Muslim woman, the Chief Justice of the Supreme Court raised issues which are not directly related to it and might have the effect of dampening the enthusiasm of Muslim women and provoking the resistance of the Muslim male.

He has linked the issue of the right of women, including Muslim women, with the cause of national integration. Emphasising the need for removing disparate loyalties to laws which have conflicting ideologies, the Chief Justice, in his ruling on behalf of the five-judge constitutional bench, expressed regret that Article 44 of the Constitution, which said the State shall endeavour to secure for the citizens a uniform civil code throughout the territory of India, has remained a dead letter.

Do rights of women need to be justified on the touchstone of their contribution to national integration instead of on their own merit? Must justice to Muslim women wait till a uniform civil law is adopted? And does uniformity always promote unity?

The cause of Muslim women and of national integration has already suffered due to their linkage with a common civil law, which is far from axiomatic.

The issue of personal law is, in fact, closely linked with the Muslim urge for identity. The near unanimity among the Muslims of the country against a uniform personal law is more a reflection of this urge than of their obscurantism. Similarly most of the clamour for a common law by the Hindus is motivated by a desire for cultural and political uniformity rather than for reform of the so-called retrograde features of the Muslim law. In fact these features are usually cited merely to buttress the case for a common law.

### URGE FOR MUSLIM IDENTITY

The urge of identity of Muslims has survived their traumatic experience of the partition of India. Though the Muslim community, nationally and internationally, has its own peculiarities, its urge for identity is no different for the universal phenomenon of sharpening of ethnic and religious identities under the impact of modernisation.

Every identity has its symbols which are not acquired through a rational and conscious choice of its members but emerge imperceptibly though a complex interplay of factors.

The sudden fall of Urdu from the high cultural and political pedestal—though for known reasons—, changes in the Muslim character of Aligarh Muslim University and campaign for a uniform personal law threw up three rallying points for the Muslim community of India.

It does not mean that Muslims today are in greater need for Urdu than English and the regional languages or that despite the mushroom growth of universities they still depend on Aligarh for their academic needs or that they are over-eager to marry four wives. The Muslim attitude on these issues is determined by entirely different reasons, which need to be understood rather than merely condemned.

Nobody explicitly insists that sub-national identities, including that of Muslims, should just cease to exist altogether. In a democratic and secular country, there is hardly any way of getting rid of them. What is in effect subject to debate is the legitimate limits and fields of the autonomy of these identities. It is argued, on the one side, that appeasement widens the limits of autonomy till it threatens national unity. But does not imposed uniformity provoke revolts of diversities and the resultant tension pose a greater threat to unity? On the other hand, a legitimate degree of autonomy, by providing means of gratification of sub-national urges, is likely to improve their emotional attachment with the nation and hence their sense of Indian patriotism and pride as Indian nationals. Of course, autonomous rights must not transgress similar rights of other communities and override claims of national interest and commonly accepted national values.

### TEST CASE

Muslim personal law has, in this context, in a way, become the test case. Whether it comes within the legitimate range and region of autonomy of Muslims is a question on which opinion is sharply divided on communal lines. One vital question that arises in this connection is whether this autonomy is compatible with the principle of equality before law?

There is no doubt that in a secular democratic country all people likely to be involved in any action should be governed by the same law. If a Muslim robs or assaults a Hindu, or *vice versa*, the criminal must be dealt with under the same law, irrespective of his community. Similarly disputes over contracts, business deals, wages, employment, etc, must be subject to a uniform law, whatever be the caste, community and creed of the persons involved. For these logical reasons, codification of common criminal and civil laws by the British government was held by the Ulemas of India to be in accordance with the spirit of the shariat.

While communal diversity is not taken into account in criminal and civil legislation of the country, customary practices of various cultural groups are not completely disregarded. Variations of laws within other federations of the world are indeed wider. In USA, for instance, not only criminal and civil laws vary from state to state, but even personal law, except that relating to monogamy, varies. The basic principle, however, is that people similarly situated, geographically, culturally, etc, should be treated equally before law.

Variations in law to make allowance for variations in situations and categories of people are nothing unusual. What is usually resented is not the difference but the discrimination in treatment; unless it be in the nature of compensatory discrimination, i e, confering more than equal rights on the weaker sections.

Is the right of a Muslim male to marry four wives a discrimination against males of other communities? If at all it is a privilege, it is at the cost of Muslim women. And if the so-called male privilege and female disprivilege are added up, can we surely say that the Muslim community is a privileged community on this account.

A graver apprehension, widely whispered and occasionally publicly expressed by many Hindus is that Muslims insist on their legal right to polygamy—the only known provision of the Muslim personal law—with a view to outnumbering Hindus.

The first premise of the apprehension, that legal provision for polygamy automatically leads to its practice, is not substantiated by statistical studies. For the percentage of polygamous Muslim families is no larger than that of such families in any other community.

The second premise that polygamy would increase the total number of Muslim wives is logically fallacious. For if some men marry more than one woman, less women would be available for the remaining men, some of whom might have to remain unmarried. While the total stock of child-bearing women would remain constant, the number of men engaged in the task of procreation would be reduced. Thus if at all polygamy makes a difference as compared to monogamy on the rate of population growth, it is likely to be in the direction of depressing it. For four men with four wives have chances of producing more children than one man with four wives.

Incidentally, the number of wives a Muslim may have under the present law is not limited to four. The law states: "If he marries a fifth wife, when he has already four, the marriage is not void (Batil), but merely irregular (Fasid)" (vide Mulla's "Mahommedan Law", section 255).

### LIBERAL ARGUMENT

A sizeable liberal Hindu opinion is, in fact, outraged by such provisions of the Muslim law. While general opposition of Hindus to a separate personal law for Muslims is based on ignorance, prejudice or fear, liberals object to it on two grounds. First, the individual and not the community should be the basic unit of a democracy. Second, Muslims too must benefit by a progressive law to the extent Hindus are doing.

The first is a question of should and reality. Shouldn't a liberal take cognisance of reality instead of imposing on it his view of it. Moreover, a community is also a means of self-expression of an individual.

The second argument confuses the issues of uniformity with reform. The solid resistance of the Muslim community to the question of reform of its personal law has been built up because it was linked with uniformity. No progress in the field of reform seems possible unless the two issues are delinked. Further, it is patronising to suggest that Muslim law should be as progressive as Hindu law. Why should not it be more or less than the latter in some of its provisions, depending on what one means by the adjective progressive?

Already in one crucial sense Muslim law is closer to the modern spirit. It is basically a contract between the man and the woman and not a sacrament as is the case in most other religions. It also implies that consent of the girl for marriage is necessary which nobody else—parent or guardian—can give on her behalf.

And what would one say of the Muta (temporary) marriage, which the Shia law recognises and in which the period of cohabitation is fixed and may be a term of years. In theory it could be as temporary as a year, a month, a day or a night.

A debate on what personal laws are progressive or desirable for the Muslim community is likely to be less inhibited if a uniform code is not insisted on. The proposed reforms should keep in view the religious prescriptions as well as the values of the modern age like equality of man and woman. Let us see how far are the two compatible.

### ISLAMIC LAWS NOT RIGID

Neither Muslim history nor any theological doctrine suggests that Islamic laws have been immutable and rigid. As M Hidayatullah observes in his introduction to "Principles of Mohamedan Law" (Bombay, 1969), "the invocation of the right of the Ruler (or the State) to take public good into account, to change an established rule, is not new. It was practised by the Khulafai-Rashidin. Changes in Hadd (limit of punishment) were made from time to time as a part of public policy, during the Prophet's own time and that of all the Caliphs". Citing an instance, Hidayatullah says that while the Prophet did not order compensation against a bailee who had lost the bailed article by theft, without any neglect on his part, Caliph Ummar ordered such compensation because the bailees began to take advantage of the rule.

Again the governor designate of Yemen, according to a Hadith, told the Prophet that he would use his own reason in making decisions on issues on which he failed to get guidance from the holy book or the usage of the Prophet. The Prophet approved of it which is an eloquent testimony to the fact that Islam is not unresponsive to new situations not contemplated in the Quran and the Hadith.

During the 1400-year long odyssey of Islam through a large part of the world, Islamic laws are known to have widely changed, from time to time and country to country. Even within India, all Muslim communities in different parts do not follow a uniform personal law and the courts respect diversities of customs and practices. The acceptance of modern common criminal and civil laws without any reservations by the Muslim intelligentsia and masses in India—as also in many other countries of the world, including Muslim countries—in place of what was strictly ordained in the Quran again bears out the fact that Islam has been responding to the needs of the times. However, Islamic scholars have insisted that all reforms must be subject to the fundamental moral and spiritual principles of Islam.

Real controversy is, however, not about the possibility and need of change in laws but its manner; who has the authority to decide that fundamental principles have not been violated?

There are four known sources of Islamic law and hence of reform: Quran, Hadith, Qiyas and Ijmaa. While divine revelation through the Quran and the practices and precedents of the Prophet recorded in the Hadith are the final authority, Qiyas or interpretation of their intention must guide in situations uncovered by them.

It is, however, the concept of Ijmaa, the congregation of scholars, which has the power of independent judgment or innovation called Ijtehad that is a distinctive feature of the rationality of Islam.

### SPIRIT OF IJTEHAD

Many Muslim scholars have urged the revival of the spirit of Ijtehad to restore a dynamic role to Islamic jurisprudence. Ameer Ali (1848-1928) who made a pioneering contribution to reviving Muslim consciousness in the subcontinent as an original thinker bewailed that "a follower of Muhammad should abandon his judgment completely to the interpretations of men who lived in the 9th century and could have no conception of the necessities of the 20th".

Similarly, Mohammad Iqbal (1876-1938) attached special importance to Ijtehad as a source of Muslim law. In his famous "Lectures on Reconstruction of Religious Thought in Islam", he held that Ijtehad "within the limits of the revealed text, is absolutely free" and "was permitted even in the life-time of Holy Prophet" (Delhi edition, p 147).

With the expansion of the sphere of Islam, territorially and numerically, it became increasingly difficult to hold an Ijmaa. For Islam is not a cadre-based, hierarchised church with registered Ulemas. Who is then authorised to convene an Ijmaa? What should be the qualifications of the participants? Should they merely be scholars of Arabic and theology or also of modern knowledge? But who is to determine religious and secular qualifications?

As Iqbal gives serious thought to the questions of Ijtehad and Ijmaa, his learned views deserve to be quoted at length and to form the starting point of a discussion on the subject.

He believes that principle of change applies even to eternal principles. For "change is, according to the Quran, one of the greatest signs of God". He therefore regrets the immobility of Islam for the last 500 years" largely due to the decline in the spirit of Ijtehad (p 147).

Iqbal does not regard the Quran as a legal code (p 165). Treating it as a source of moral and spiritual guidance, he relies on Sura 26-69: "Those who exert themselves in our paths, we will surely guide."

He rejects the claim of the Ulemas of Islam about the finality of the Mahomedan law and pleads for Ijtehad to reinterpret it in "the light of modern experience and the altered conditions of the modern life" (p 168).

Faced with the problems of convening an Ijmaa, Iqbal observes: "Legislative assembly is the only possible form Ijmaa could take in modern times", to which the power of Ijtehad may be transferred. In other words, laws passed by Parliament would be as valid as those adopted by Ijmaa of earlier times. If the Muslim personal law was passed by a majority of Muslim MPs while others abstained, the decision, according to Iqbal's logic, should have perfect religious sanctity.

While there may be no unanimity about the modus operandi, scholarly opinion overwhelmingly favours the view that Muslims have a right to change their laws (i e, those which exclusively concern them). In any case, who but Muslims can decide that they have this right.

The remaining question is the criteria for change; indicated by modern human values and spirit of Islam. Could equality of man and woman be one of the criteria for judging the provisions of the Muslim personal law?

## RIGHTS OF WOMEN

It seems unlikely that the Muslim community can be led to believe that equality of sexes is in conflict with the spirit of Islam. But who is the final authority on the basic principle, the Constitution or the community? If the community, can its male members arrogate the right to decide that they have superior rights over females? Or shouldn't it be the right of Muslim women to decide whether they continue to prefer an inferior status? If the right of non-Muslims to impose their views on the legal status of the families of Muslims is challenged, the right of the Muslim men to impose their views on the status of women would similarly be challenged.

If the principle of equality is conceded, present legal provisions regarding polygamy, divorce, guardianship, inheritance, Iddat and maintenance would have to be drastically modified.

While Mahomedan law permits a male Muslim to have as many as four wives (fifth marriage being irregular though not void), "it is not lawful for Mahomedan woman to have more than one husband at the same time" (Mulla, sections 255 and 256). The provisions for men and women in this respect are grossly different and inequitable.

As far as divorce is concerned, "any Mahomedan of sound mind, who has attained puberty, may divorce his wife whenever he desires without assigning any cause" (Mulla, section 308). The divorce may be oral or written (section 310).

The power to give divorce belongs primarily to the husband. But he has a right to delegate the power to his wife who by virtue of power acquired from her husband can divorce him (Mulla, section 314) It, again, is a patently unequal position.

However, the Dissolution of Muslim Marriages Act VIII of 1939 gives substantial relief to Muslim women on this issue and lays down the following grounds of divorce: (1) the whereabouts of the husband are unknown for a period of four years; (2) failure of the husband to provide for the maintenance of the wife for a period of two years; (3) sentence of imprisonment on husband for a period of seven years; (4) failure without reasonable cause to perform marital obligations; (5) impotence of husband; (6) insanity of husband; (7) repudiation of marriage by wife (a minor girl married by a father or grandfather has a right to repudiate marriage after attaining age of 18 years provided it was not consummated); (8) cruelty of husband, and (9) apostasy from Islam of the husband.

The enactment definitely improved the status of Muslim women. But all the grounds for divorce in the case of a woman are subject to proof and judicial scrutiny whereas a man need not assign any reason for divorcing his wife. This is far from the requirements of equality of sexes.

Inequality is equally glaring in the law relating to guardianship. For it recognises the father as the primary and natural guardian of his minor children. The mother is only entitled to the custody of her male child until the age of seven and of her female child until she attains puberty. But the right of custody is subject to the supervision of the father and this right, too, lapses after her remarriage.

The law of inheritance is no less inequitable. For whatever be the line of succession, the share of male heirs at every level shall be twice that of female heirs at that level.

Provision of Iddat, period of seclusion, applies only to a woman after divorce or death of her husband and is clearly discriminatory.

Another issue that concerns the rights of women, though not directly linked with the question of equality, is that of maintenance. Under the Mahomedan law there is no provision for maintenance for a widow or a divorcee; except that in the case of the latter, it is limited to the period of Iddat (seclusion) which lasts from three months to the period of pregnancy, whichever is longer.

The right to maintenance of a married woman, according to the Mahomedan law, is valid only so long "she is faithful to him and obeys his reasonable orders' and she is "not too young for matrimonia intercourse". Inferiority of woman implie in this provision, is unmistakable.

However, Sections 125 and 127 of th Code of Criminal Procedure 1973 recognise the right to maintenance as a distinc statutory right irrespective of the nationalities or creed of parties and makes i independent of personal law or any custom governing the parties. Section 127(3), in fact, grants additional rights to a divorced Muslim woman for receiving maintenance beyond the period of Iddat, till such time as she has not married after her divorce (1979, *Allahabad Law Journal*, 210).

The right of a Muslim divorcee to maintenance, independent of mehr, was categorically upheld by the Supreme Court in 1980. In his judgment on Fuzlunbi *versus* K Khadar Vali, V R Krishna Iyer observed, "Section 126-127 is a secular code deliberately designed to protect women, who are victims of neglect during marriage and divorce. It is rested in the State's responsibility to the weaker sections of women and children and is not confined to members of one religion and region" (AIR 1980, S C, 1730).

The latest judgment of the five-member constitutional bench of the Supreme Court (April 1985 confirmed the legality of the right of a Muslim divorcee to maintenance earlier upheld by Allahabad High Court (1979) and Supreme Court (1980). The Chief Justice ruled that section 125 of the Cr PC was not only consistent with the Muslim personal law but also with Quranic injunctions.

The amended criminal code and the Supreme Court judgment raise a number of vital issues. The right of a Muslim woman to maintenance is now guaranteed by a common secular law overriding the personal law. Would other provisions of the personal law be similarly void if they clash with the basic law of the land? What would then happen to the autonomy of the Muslim community in this respect?

While this is not the place for a fine constitutional debate on the subject, it seems obvious that religious groups do come in the category of reasonable classification entitled to be governed by their respective personal laws. However, the constitutional obligation to the rights of women—who also constitute a distinct category—, in particular their right to equality with man, cannot perhaps be dismissed. But does the constitutional position clash with the moral and natural rights of Muslim women? Or with the spirit of Islam?

Some eminent Muslims do maintain that Mahomedan law does not represent the spirit of Islam, Justice Krishna Iyer, in the above cited case, referred to an elaborate judgment of Justice Beharul Islam "replete with quotes from the Holy Quran" in which he expressed the error of regarding "Talaq in Muslim law as good even if pronounced at whim or in tantrum".

Further, it is pointed out that the practice of Talaq, by thrice pronouncing the word, is merely permitted. It is not commended, and is, in fact, condemned by the Prophet. That woman had as much right of Talaq as man is borne out by a Hadith in which the Prophet granted a woman's request for divorce.

Again, polygamy is permitted but not commended. If the conditions prescribed by the Quran for permitting a second wife were to be enforced, polygamy would simply become impossible.

But the only way to judge the spirit of Islam is by the direction it gave to pre-Islamic laws and customs. The attempt to humanise an unjust patriarchal system was indeed revolutionary. It is unfair to measure the reforms introduced by Islam, torn out of its historical context, in terms of the values of today. Equality of sexes is a very recent concept which is a product of opportunities of independent careers for women and universal education and franchise.

The traditional rights of a man were based on the presumption that he was the head of the family, its bread-winner and protector. Asghar Ali Engineer quotes the Quran (4:34) to show that this precisely is the reason cited therein for conceding male superiority over the female. What would the spirit of the Quran indicate if this situation changes and woman is no more exclusively dependent on man? The situation may call for a revolutionary change in the status of women in society, as the Prophet had introduced in the Arabian society 1,400 yeas ago. Isn't it a situation like this for which Islam had made a provision of Ijtehad?

### UNIFORMITY *VS* INTEGRATION

The purport of this note is not to settle all legal and theological issues on the subject. It merely examines the scope for reform in Islamic laws, on human, constitutional and religious grounds and the capacity of the reformed laws to meet the needs of modern society. It is a plea for a debate on a subject of vital importance to Muslim community as it concerns the happiness of its families, the urge of its women for an equitable status and its socio-economic life. Such a debate should not only be possible but should also become necessary if it is insulated against the threats and provocations of a uniform personal code. In fact the debate itself would help in ensuring this insulation. Needless to add, the health and growth of a community also depend on its ability to debate its problems. And no tradition has survived long without continuously changing.

Some sort of debate is, in fact, going on in the Muslim community. It has for instance been vigorously pleaded that a permissive and not a compulsory law may be enacted for those who may opt for it. Again, the All-India Women Conference, under the presidentship of Begum Hamid Ali, had suggested way back in the early thirties the inclusion of the rights of women in the Nikahnama. As Muslim marriage is based on the principle of contract, it can be made as equitable as one likes without violating the present law and a rigid fundamentalist position. Kamila Tyabji who has been campaigning for this course and whose family has been following it, refers, in this context, to an agreement drafted by a Muslim firm of solici-

## APPOINTMENTS

**Institute of Public Enterprise**
OSMANIA UNIVERSITY CAMPUS
HYDERABAD 600 007, INDIA

*NEEDS*

**FACULTY**

The Institute is an independent non-profit research agency funded by Public Enterprises, State and Central Governments and is recognised by the Indian Council of Social Science Research as a national centre in the field of Public Enterprise. Besides undertaking research on areas of relevance to public enterprise management it conducts an MBA in Public Enterprise programme exclusively to benefit practising executives. The Institute also conducts a one year post-graduate programme leading to Diploma in Computer Systems. It also supports Ph D programmes. The growing research, training, consultancy and teaching activities of the Institute offer excellent opportunities to persons with brilliant academic record and proven research/teaching experience. The Institute needs Faculty in the following areas:

1 **FINANCIAL MANAGEMENT:** Minimum Qualifications: Chartered or Cost Accountant with at least 6 years experience in industry or training/research institutions. Ph Ds/MBAs with specialisation in Finance area with less than 6 years work experience will also be considered.

2 **ORGANISATIONAL BEHAVIOUR/DEVELOPMENT:** Minimum Qualifications: Ph D in Organisational Behaviour/Industrial Psychology with at least 6 years of Research/Management Development Experience.

3 **MARKETING:** Minimum Qualifications: MBA with specialisation in Marketing with experience of consultancy, training, research on marketing in public enterprise.

4 **ECONOMICS:** Minimum Qualifications: Ph D in Economics with consistently good academic record. Research/Consultancy experience of about 6 years in a reputed organisation/Institution.

5 **CORPORATE MANAGEMENT:** Minimum Qualifications: MBA from any of the premier Management Institutes; Experience/aptitude in training or research would be preferred.

**EXPERIENCE IN PEs:** Persons with qualifications close to these indicated above but who have work experience in relevant area in PEs will be preferred.

**SCALE OF PAY:** Depending upon the Qualifications and experience the candidates may be placed in Rs. 700-Rs. 1600; Rs. 1200-Rs. 1900; Rs. 1500-Rs. 2500 (UGC Scales) with allowances as per UGC Rules.

Please apply in strict confidence with full particulars of age, qualifications, experience and present/expected emoluments alongwith two references to the Director of the Institute within 15 days of the Advertisement.

tors, included as an appendix in Fyzee's "Outlines of the Mohamadan Law" as also to a "shorter and much dramatic version of the contract" drafted by Daniel Latifi which bears the stamp of the Chief Qazi of Aligarh. The latter had three provisions: first, equal position of husband and wife as regards divorce; second, mehr, half of which to be paid immediately and the rest deferred to death or divorce; and, third, no right of polygamy to the husband.

It is a liberal trend like this that is likely to be threatened by the *obiter dicta* of the Chief Justice who has, transgressing his judicial role, sanctified the general Hindu obsession for uniformity of the civil law. If at all there is a correlation between uniformity and integration it is more a negative than a positive one.

**MAHARASHTRA**

# Change of Patil

## JVD

THE last time when Vasantdada Patil resigned from a ministerial office in the mid-seventies, he was irrigation minister in S B Chavan's cabinet. At that time, he not only resigned from the cabinet but had also announced his retirement from active politics. Within a few months he was back in office, in fact as the chief minister. "He could not stay retired when the ship of the Congress party was afire", he explained then. His return effectively ended the political career at the state level of S B Chavan.

Almost a decade has passed since then, the Congress party has undergone several editions more, Vasantdada himself has been in and out of the Indira/Rajiv version of the party a couple of times; indeed so have been S B Chavan, Gadgil, Shivraj Patil and most other frontline leaders of the Indira Congress in Maharashtra. Once again Vasantdada Patil has now found it necessary to resign from office, this time from the chief ministership of Maharashtra. Significantly though, no retirement from active politics is perhaps planned this time, at least it has not been announced.

One may take with a grain of salt the ostensible reasons behind the latest resignation (Vasantdada himself has not publicly given any). In the Congress culture as it has evolved in the past decade or two, chief ministers of states have, at best, been no better than errand boys and justifiably enough, have been treated no differently by the central leadership of the party. As a general secretary of the party for a few years, Vasantdada himself has been a willing collaborator in the systematic downgrading of state-level leaders, through a succession of Anjiahs and Pahadias and Antulays and Bhosales. Evidently, after becoming a chief minister, one changes one's perspective.

Starting out as a freedom fighter over forty years back, and later as a leader in the co-operative movement, and as a loyal organisation man in the state Congress, Vasantdada established widespread contacts at the grassroots level, throughout western Maharashtra and today has a good following there. When, after the debacle under Antulay and Bhosale, the party leadership had no option but to turn to Vasantdada, he proceeded to build upon this following by a shrewd use of state patronage. It is believed that in the current legislative assembly, a majority of the party members are allied with him.

Such a situation could not be expected to last, given the preference of the party bosses for weak chief ministers beholden to the central leadership. Till such time as there was no alternative, Vasantdada had to be kept on. It was always clear that if and when Sharad Pawar decided to switch sides and join with Rajiv Gandhi, Vasantdada would get short shrift. By not waiting till the Rajiv Gandhi-Sharad Pawar axis crystallised, Vasantdada once again has exhibited his political acumen.

By resigning just when Sharad Pawar had started talking sympathetically of 'Congress culture', Vasantdada has not only put both Rajiv Gandhi and Sharad Pawar on the defensive but has probably postponed the party-switch of the latter by at least a few months. Also by subtly presenting himself as a victim of the overbearing ways of New Delhi, he has ensured that he can carry the banner of the self-respect of Maharashtra *a la* NTR, should the need arise, depriving Sharad Pawar of the same role in the process.

By neither leaving the selection of the new leader to New Delhi nor waiting for the clearance by New Delhi of the cabinet list of new chief minister, the Congress party in Maharashtra legislature has shown how influential Vasantdada Patil continues to be, even as an ex-chief minister. However, not much should be read into this seeming show of independence. The picture may change substantially when the chips are really down. It may be recalled that the Congress members in the legislature had expressed full confidence in Antulay just before he was asked to resign.

Moreover, on the wider state level, there are clear limitations to Vasantdada's influence. The co-operative political machine which has brought prosperity and power to the rich and the middle peasantry in western Maharashtra (which is popularly called the 'Maratha lobby' or the 'sugar lobby') and of which he is one of the major representatives today has not been able to go beyond and encompass the scheduled castes, the rural landless or the urban masses. Indira Gandhi showed in the past that even with a rag-tag of Antulays and Tirupudes behind her, it was possible to bypass this Maratha machine to a significant extent. (It was only after that a somewhat chastened Vasantdada joined her again.) Today there seems to be no political movement in Maharashtra capable of harnessing this potential force.

With Rajiv Gandhi's preference for a new style of politics—depending more on mass media and less on local resources—the influence of the old-style politicians like Vasantdada Patil is bound to wane in the party. Nevertheless, there are evident limitations to the new politics in the Indian context, as the central leadership is now discovering. Just as it cannot wish away Jagannath Mishra in Bihar, similarly it will have to learn to cope with leaders like Vasantdada Patil and the forces he represents in Maharashtra for quite some time to come. It is in this context that an alliance between Sharad Pawar and Rajiv Gandhi may prove fruitful to both.

Of course, no one is under any illusion that any such realignment of these groups and the sections of the society will lead to any betterment of the lot of the common man. It is notable that in all the hullaballoo over the resignation of the chief minister and the change in the ministry, no one has a word to say about its likely impact on the common man. There is not going to be any. So far as the most urgent problems facing Maharashtra today are concerned—whether it is the matter of drinking water to about 40 per cent of the state's population, or whether it is the growing nexus between the criminals and the rulers, whether it is the rising cost of living or the crumbling state of administration, no observer of the state's political scene expects any improvement. Understandably so, because, quite realistically whether Patil goes or Nilangekar-Patil comes, whether Pawar changes sides or not, it may be confidently expected that the common man will continue to be where he has always been—at the bottom of the priorities of the politicians.

# Women's Movement in India: An Assessment

A R Desai

## I

THE UN declared in July 1975 the subsequent ten years as the International Women's Decade. This decade will be over in July 1985 when special conferences, one by the official representatives deputed by various countries and another comprising representatives selected by non-governmental women's organisations, will be held in Nairobi to assess the achievements and limitations of the women's movement during the decade and chalk out guidelines for the subsequent period.

During this decade a conscious endeavour to understand the specific problems of women and systematic efforts to create awareness of these problems by women among women in particular and citizens in general was made all over the world. A new sensitivity about the overt and subtle oppression of women has been generated. As rightly pointed out, the International Women's Decade brought to the centre of human awareness and highlighted in a focused manner some crucial facets of the women's movement which had been developing in an unconnected, parallel manner for a long time.

These facets manifested themselves in certain crucial quests: (i) for analysis of women's problems and discovering the real sources of their oppression and exploitation; (ii) for evolving democratic forms; (iii) for approaches to male participation; (iv) for evolving appropriate forms and techniques of campaigns launched round various issues, from the most intensely personal to larger economic, political, social and cultural ones; (v) for organisational forms and structures which do not become an ossified, bureaucratic aggregate of a small group of organisations and individuals but which would transform small groups, grassroots level collectives and organisations into well-knit networks which would mirror and coordinate the diverse experiences of different groups into a collective experience accumulated over decades.

In fact the International Decade, by focusing on women's issues and movements, worked as a catalyst to highlight and stimulate all aspects of women's growing awakening, organisational experiments and theoretical and practical struggles which were evolving during the late sixties and seventies. It helped the women's movement to become a "powerful source of political energy, a developing body of theory, a battle-ground and a sisterhood".[1]

In fact the simultaneous focus on various quests indicated above made the women's movement into a powerful feminist movement, aptly characterised by Adrienne Rich in her passionate style: "If we conceive of feminism as more than a frivolous label, if we conceive of it as an ethics, a methodology, a more complex way of thinking about the condition of human life, we need a self-knowledge which can only develop through a steady, passionate attention to all female experience. I cannot imagine a feminist evolution leading to a radical change in the private/political realm of gender that is not rooted in the conviction that all women's lives are important, that the lives of men cannot be understood by burying the lives of women; and that to make visibie the full meaning of women's experience, to reinterpret knowledge in terms of that experience, is now the most important task of thinking".[2]

## II

Indian women have also been a part of the world-wide awakening. The International Women's Decade helped them to simultaneously focus on diverse issues which different sections of Indian womanhood were trying to clarify, fight for and organise themselves round at various levels. The struggle for women's rights in India has a long history going to at least the mid-nineteenth century and, more purposively, the class and mass struggles against British rule in the twenties, thirties and forties of the present century.[3] It acquired, however, a new edge, objective and sensitivity from mid-sixties, when it was realised that the formal rights granted in the constitution and subsequent policies formulated presumably to implement them were being vitiated, distorted or not permitted to be exercised by the rulers themselves pursuing a particular path of development. The inherent anti-poor and masculine-patriarchal bias inherent in that path of development was becoming clear from the mid-sixties. The plans which were supposed to usher in growth with justice exposed their true pro-property and masculine-patriarchal character and started to reveal their inability to expand the limited opportunities available to the vast bulk of the poor and the various disadvantaged classes, castes, minorities and the overwhelming majority of women. Along with the upsurge of other disadvantaged strata, the women half of the Indian population also started stirring. By the mid-seventies individuals, groups, grassroots activists, researchers and sensitive sections of urban and rural women started a conscious search for preventing the opresssion and exploitation, sexual harassment and domestic violence and which were being intensely felt both by educated middle class women as well as by women of the agrarian poor, ruined artisans, the tribal population, as well as scheduled and other despised castes and craft groups.

The document "Towards Equality"[4] effectively highlighted the overall situation of Indian women. The International Women's Decade provided a stimulus to the need for a focused approach to the women's movement in the country. During the decade, the women's movement acquired a new sensitivity. It started off with a new approach wherein women's issues were not seen as problems needing merely relief, rescue and rehabilitation. They were looked at from a totally different perspective. The problems of women were seen as problems of active, participating, dignified human beings and not as those of objects of pity and piety. During the decade a sensitive section among women developed a qualitatively different and higher type of awakening and developed a new perspective and thrust with regard to various categories of humiliation, atrocities, tortures and individual and mass assault to which they were subjected. They started questioning the postulates of official, dominant social-cultural and economic norms which provided the basic *gestalt* of the social-economic and politico-cultural order which was being ushered in after independence. They started exposing the fallacy underlying what was overwhelmingly assumed to be the private affair of the family; they pointed out how these issues were public and social. They struggled to break the barrier of many a widespread myth which even large sections of women believed and which forced them to hesitate to acknowledge or openly convey their true experiences. They wanted to emphasise that it was erroneous to accept the traditional image of a good woman as an accommodating, self-sacrificing and efficient member of the family which was soaked through and through with masculine patriarchal values and norms.

During this decade seminars, publications, projects, documentation of literature and researches proliferated. Conferences and seminars focusing on different aspects of women's life were held. Various campaigns were launched to highlight significant issues. Several struggles were carried out in different parts of the country round different issues. Numerous women's groups, collectives and organisations emerged, sometimes focusing on certain issues and sometimes undertaking the task of overall conscientisation of women. Participation of women in the struggles of exploited and oppressed classes and strata developed in various parts of the country. Women participated in struggles in coal mines, quarries and in various industries, organised or informal. They also participated in the growing struggles of adivasis in tribal areas in different parts of the country and of dalits against caste oppression. Women belonging to various religious denominations started raising their voice against the adverse impact of patriarchal, demeaning and discriminatory personal laws. Women took a leading part in the struggles against price rise. They also participated in struggles against oppression and harassment in academic and administrative/office set-ups. They started crusading against the degrading use of women's bodies in advertising for augmenting sales and profits by government and private enterprises. Women extended their struggles on the legal front and conducted many battles to change laws or force the administration to effectively implement the laws. In short, during the decade women's struggles proliferated and acquired a new focus.

A systematic history of the women's movement which can give a proper picture of the development of the women's movement that grew during International Women's Decade has become an urgent need.

## III

The International Women's Decade will end in July 1985 with a set of conferences to be held at Nairobi. From the last quarter of 1984 a series of meetings and seminars are being organised in India to appraise the achievements and limitations of the women's movement during the decade. Some meetings were also held to suggest ways and means of future action and to help formulate appropriate resolutions for the forthcoming Nairobi meetings.

One of the most significant national seminars was organised in Bombay in January this year. It was held under the auspices of the Research Unit on Women Studies, a centre for study, research, documentation and publication, which has been operating for more than a decade as a distinct unit of the SNDT Women's University in Bombay.[5] This organisation is not just a formal research centre, but endeavours to provide a platform for bringing together activists, researchers as well as researcher-cum-activists. It also acts as a catalyst assisting in many ways various women's organisations and activists to advance the cause of women and the women's movement.

The theme of the seminar was "A Decade of Women's Movement in India: A Review of Achievements". This seminar was notably different from many other seminars for a number of reasons:

(i) Nearly eighty deletages participated in the seminar. Along with the delegates, there was a large contingent of observers from many places who also contributed to the discussions.

(ii) Among the participants and observers were activists of the older age-group and organisers connected with older women's organisations which traced their history to even before independence. There were also young activists, even some teenagers, who have been connected with organisations and collectives carrying on different types of struggles in rural and urban areas in different parts of the country. Some of them bore the scars of battles fought by them as representatives of dalits, adivasis and women of tribal and rural poor, not excluding women working in the urban ghettos.

(iii) The participants in the seminar came from all over India, from Assam, West Bengal, Andhra Pradesh, Delhi, Bihar, Rajasthan, UP, Chandigarh, Gujarat, Maharashtra, Karnataka, Tamil Nadu and other regions and states.

(iv) Some of the participants and observers were actively involved in politics, associated with various political parties. Some were non-party persons but actively involved in political activities. Some delegates were associated with medical, legal and other professions and white-collar services. Some were working in educational and research institutions, also heading women's associations or unions in their respective fields. Some delegates and observers were associated with the press and other mass media, not merely as professionals but also as individuals actively involved in consciousness-raising among women through such media.

## IV

The seminar was so arranged that it could systematically examine the older women's organisations as well as review the functioning of newly emerging organisations and groups. It was also arranged in a manner that would help to systematically unfold the patterns, issues and underlying assumptions which guided the organisations. Thirty papers were prepared for the seminar.

The first session was devoted to the older organisations, focusing particularly on the All-India Women's Conference (AIWC) which was founded before independence and which played a fairly significant role highlighting the problems faced by women in the colonial setting and was actively involved in the nationalist movement. This involvement was basically in the spirit and as per the norms of that movement as contoured by the Indian National Congress. A few papers analysing the achievements and limitations of the AIWC during the pre-independence period and its mode of functioning after independence were read and discussed. They provided interesting insights into the reasons why organisations of this type are not able to lead the different types of struggles emerging after independence. Papers critically examining the present functioning of the AIWC through case studies of their branches in certain areas provided very fruitful, though sometimes stormy, discussion.

The second session centred on papers which examined the programmes, activities and functioning of organisations and associations which have emerged to protect the interests of educated women—doctors, lawyers, scientists, academics and researchers as well as white-collar employees in various categories of public and private sector enterprises. The emergence of new associations of women professionals and white-collar women employees has been mostly a post-independence phenomenon.

The papers, though few, clearly revealed how the problems faced by associations of the highly skilled, relatively affluent professional women were of a different nature from those faced by unions and associations connected with white-collar employees. The papers and discussions brought out some of the basic limitations of such organisations, particularly professional associations of the affluent professions. White-collar women and employees faced many subtle and overt forms of discrimination which were in addition to the common problems faced by all employees. This was due to the deep-rooted masculine prejudices and practices consciously and unconsciously upheld by both employers and even male fellow-employees. The discussion revealed the types of harassments, obstacles and sub tle and overt forms of discrimination, insecurities and threats which women employees face. The papers also brought out how a slow but steadily growing resistance is being worked out by the women employees in their respective places of work.

The third and the fourth sessions were devoted to the nature, problems and functioning of new grassroots organisations in the form of collectives and associations which have proliferated during the last couple of decades all over the country. A large number of papers provided valuable information about such associations. These grassroots organisations have been coming into being and are functioning in tribal, rural and urban areas. They are carrying on agitations, campaigns, rescue and rehabilitation work, legal and pressure movements to expose the atrocities and tortures which women of various strata are subjected to. They are also involved in the activities which attempt to assist, console and prepare the victims to build up courage and organise themselves to fight back. Some of these organisations take up the issues of battered women, of women who are raped, tortured or are led to the stage of even attempting to end their lives. They crusade against the menace of dowry which has resulted in thousands of murders of married women mis-described as suicides or dowry deaths. Some of the organisations have started a systematic campaign for conscientisation of women through the use of various media like posters, pamphlets, exhibitions, slide shows, films, street corner plays and group songs as well as 'padayatras' in certain areas.

Some of the organisations are concentrating on work among slum women or women living as squatters. Some of them are rooted among women working in the unprotected informal or small scale industries, in plantations, coal mines, construction works and various vocations in rural areas. Some of them have been combining constructive relief and income generation experiments along with consciousness-raising campaigns for family reform programmes to humanise the relationship between men and women. Some of the organisations are evolving devices to fight injustice and insults by establishing women's courts and providing on-the-spot punishment to those who insult or abet in inflicting insults and humiliations on women.

The range of activities and the variety of organisations which have been emerging at the grassroots level focusing on different issues and under different regional situations defy simplistic classification.

Nearly thirty papers and additional oral presentations made during the two sessions provided a panoramic glimpse of the working of the grassroots organisations that have been emerging and have been functioning during the last two decades, more particularly during the last decade. These papers also exposed the canard that is being spread by some parties that these grassroots level organisations are planted by CIA and other agencies to disrupt the movements of the exploited and the poor. The papers also revealed the day-to-day tortures and brought out the insecurity and fear which haunt women in their daily life. They exposed the wide-ranging exploitation and oppression and the atmosphere of political-social and economic terror under which women carry on their day-to-day life and their heroic battles to retain 'Ijjat'. The papers also threw light on the varied nature of struggles, in terms of issues, strategies, methods and skills, as well as the difficulties experienced by the grassroots women workers, endeavouring to build up organisations from below.

The papers were prepared mostly by representatives of the various grassroots organisations and were presented in the seminar not to display the scholarship of the authors. They were written with the objective of familiarising the participants with the details of specific experiences and evoking responses from others to some of the acute problems and limitations the authors experienced in conducting their activities. Along with the informal get-togethers outside the seminar, this specific purpose underlying the writing of the papers transformed these sessions into a deeply moving, rich, free and frank conscientising experience. While there were occasional traces of pettie-bourgeois individualistic assertions based on some spectacular achievement or sacrifice made by some, this was a very minor feature. On the whole, the atmosphere in which the discussions were carried on were full of concern and overall modesty based on the realisation of the tremendous tasks which lay before all those who were espousing the cause of women. There was also an awareness of the numerous hardships and limitations which the groups were facing in carrying on their struggles single-handedly and many a times in isolation and against enormous odds.

The last session was devoted to discussion of some crucial theoretical and practical issues which emerged from the earlier discussions. The participants discussed problems of isolation, paucity of funds, dangers of foreign funding and limitations of cadres. They examined the relative merits and weaknesses of the groups in dealing with obstacles and combating the efforts of powerful vested interests and agencies of state, including the growing violence of the police, to weaken, divide and repress their struggles. They took note of the impact of the emerging threat of a nuclear holocaust which is reflected in the growing militarisation of entire societies. The threats to women's existence and deterioration in the conditions of women's earning power as a consequence of the global economic recession, massive retrenchment leading to growing unemployment and underemployment among those who have to live by selling their labour power and skills and its more drastic impact on earning opportunities for women in particular were taken note of.

The discussion was marked by awareness of the overall deteriorating economic conditions of the vast mass of the Indian people, galloping inflation, mounting foreign debt, growing unemployment and underemployment, affecting more acutely women, the dangerous trend almost consciously engendered by employers, in both public and private sectors, to utilise women's labour in informal, unorganised and unprotected sectors, bypassing all laws and norms and using women for piece-rate or putting out forms of work. The impact of the rising tide of casteist, communalist and other forces reflected in growing caste, communal and linguistic and other riots and disturbances and their anti-women implications were also noted and it was agreed that these forces will have to be understood to be effectively combatted in the forthcoming decades. There was, however, not sufficient realisation of the deeper implications of this emerging larger socio-political and economic-cultural scenario. The long-term effect on the problems of women in the next stage of the women's movement was also not appreciated as it should have been. However, the very awareness of the problems made the participants desist from passing recommendatory resolutions for the Nairobi conference. This fact itself revealed the tensions and apprehensions over the shape of the women's movement in the newly-emerging social-economic and political context.

## V

It is difficult to capture here the many-sided and throbbing atmosphere generated in the seminar or to record in detail the problems which the sensitive activists and researchers raised through the 30 papers and the intense and free discussions during seminar. The organisers should publish the material generated during the seminar, including the papers and the discussions.

The seminar, however, left certain overall impressions which can be summarised without hesitation.

(1) In India the problems of women have not remained peripheral, non-essential or secondary. Nor are the women's movements and struggles insignificant, erratic or momentary outbursts of upper or middle class educated women. The feminist movement has brought into focus the problems of women who constitute nearly half of the Indian people. If the struggles against the inequities and day-to-day injustices and indignities and economic exploitation and social torture to which women are subjected to in the family-kin-community setting and in public life are not sharpened and expanded, there will be no humane-equalitarian base for Indian citizens so vociferously proclaimed as a goal in the preamble of the constitution. The problems of women are no longer merely problems concerned with women but human problems affecting the entire human kind. They are problems concerning the unshackling of human creativity as a whole. The struggle for women's emancipation is not a problem imported from the 'materialist' West which has no relevance to the 'spiritual' East where, it is claimed, women are highly respected. In fact the papers and discussions revealed clearly how the struggle for emancipation in India is a part of the global struggle.

(2) The papers and discussions clearly highlighted the fact that Indian women are developing a new sensitivity and consciousness which will no longer tolerate the suffocating familial, institutional, political and cultural norms which place them in a humiliating, subject status. This sensitivity may not be able to express itself in a clearly articulated, intellectual, logical form, but it is manifesting itself as a deep undercurrent of ferment which is slowly acquiring a higher voltage and is acting as a powerful force in the nethermost depths of society. The description of the struggles and agitations portrayed in the papers, if properly collated and made public, will clearly point out how these movements are spreading in all parts of the country, in the hills and forests of Himalayas and Vindhyas, in the coal mines, factories and fields of Bihar, West Bengal and other states as well as in the ghettos, factories and offices of the urban metropolitan centres of the country.

The exhibition of books and material published recently and the papers which were presented clearly revealed the range of the movements that have been launched in the country.

(3) The participants and observers who attended the seminar revealed another facet of the growing women's movement—the slowly but steadily emerging clusters of dedicated and intelligent activists/researchers. The majority of the participants themselves symbolised these newly emerging bands of intelligent, sensitive, militant women from different strata carrying on the tasks of conscientisation and institutionalisation, and conducting agitations and struggles in their respective areas. The delegates and observers representing various associations, collectives and mass organisations demonstrated that a dedicated leadership rooted in the masses is maturing and spreading which gives confidence that it will shoulder determinedly the tasks confronting the feminist movement in the future.

# Bonn Summit and 'Star Wars'

**Michael Jacobs**

LAST month's summit of Western heads of government was more notable for the subjects not discussed than for those which were. The silence speaks volumes about the disagreements between the industrialised nations: the field of nuclear defence stands out.

The final communiqué of the summit was a predictably bland statement on the world economy. Despite unemployment of over 20 mn in Europe and another 8 mn in the US—let alone the recession in the rest of the world—keeping inflation and public spending down remained the government's top priorities. No mention was made of Third World hunger or debt, save a general desire to "improve the stability of the world monetary system" and to encourage greater trade by removing protectionism. But even here agreement on a new round of GATT trade talks could not be reached, with President Mitterrand holding out against any negotiations which could upset French farmers before his midsummer National Assembly elections. With Britain's Margaret Thatcher and Chancellor Kohl of West Germany firmly opposed, the US desire for a co-ordinated European reflation to take the pressure off its own $ 220 bn budget deficit was quickly smothered. The communiqué merely hoped for "lower interest rates and more productive investment", while providing for no measures to bring either about.

Outside the economic field, the government leaders scrupulously avoided talking about President Reagan's controversial visit to the Bitburg war cemetery, where Nazi stormtroopers are buried: this was supposed to be an act of reconciliation with Germany on the 40th anniversary of the end of the Second World War, but had become, after Jewish outrage, an embarrassment for the President in which no one was keen to get involved. Neither did they discuss the recently-announced US economic sanctions against Nicaragua, which all the European countries, and Canada, strongly oppose. Perhaps most crucially, President Reagan's Strategic Defence Initiative (SDI) was also ignored. This was entirely for the sake of demonstrating unity, for the US' proposals are in fact the cause of more dissension amongst the Western nations than any of the other issues. Their importance cannot be understated, for the militarisation of space threatens the security of the whole world, South as well as North.

The Strategic Defence Initiative is at this stage no more than a plan for the 21st century, that laser weapons should be installed in space to knock out intercontinental nuclear missiles and thereby prevent nuclear war. President Reagan's enthusiasm for the idea, now universally known as 'Star Wars', has led him to declare that the SDI will ultimately "render nuclear weapons obsolete" and to offer the technology to the Soviet Union once it is complete.

The reaction of the American scientific community to such suggestions was at first hilarity: an 'infallible defence' in space belonged only to the realm of fantasy. To destroy a hardened missile on launch or in flight would require a laser beam intensity approximately one million times greater than currently achievable. The number of orbiting lasers and auxiliary satellites required would simply not fit in the "space" available; only a few would need to be eliminated to make the system inoperable. A missile could release any number of decoys to confuse the defensive system, which, given the short time involved, would have to be run by a computer implausibly complex and immune to mishap. Moreover the SDI takes into account only ballistic (intercontinental) missiles. It would be no defence against low-flying Cruise missiles, aircraft or small nuclear weapons smuggled in surreptitiously. The possibility of an 'impermeable shield" was conclusively debunked by the disclosure that the US is already funding research into an Advanced Strategic Missile System for penetration of 'Star Wars' defences.

But Reagan and his advisors were not joking, and research into Star Wars is already under way. The programme is huge: it has been described by a senior European diplomat as "the greatest American national scientific, technological and industrial effort of this century". That such resources should be devoted to a military absurdity is not, however, evidence of the President's foolishness. On the contrary, the SDI offers major benefits to the United States.

First, its powerful defence industry has been lobbying assiduously for the research programme, anxious to get funds not merely for advanced military developments in computer, electronics, laser and communications technology but for the many civilian and consumer spin-offs that are expected. Already the top 10 defence contractors have received 87 per cent of the research allocated. Secondly, the US military itself is keen to exploit the SDI research programme for the 'intermediate stages' which will accrue before the purely hypothetical final stage is reached. For example, it is reckoned that already by the 1990s the Pentagon will be able to deploy a dangerously threshold-lowering 'point defence' system for missile silos and military bases, while *offensive* laser weapons will certainly be developed before the supposed *defensive* 'shield' can be installed.

Thirdly, there is without doubt a faction in the US Administration, led by Richard Perle, the Assistant Secretary of State for Defence, which sees Star Wars as a means of abandoning all attempts at arms control and forcing the USSR into an accelerated arms race which would bankrupt the Soviet economy and give the Americans an unchallengeable weapons superiority. It is not clear yet whether this is the President's goal, but neither is it clear if that matters, given the influence of his advisors over US policy. Already the refusal of the Americans to negotiate on the SDI has effectively halted the nuclear arms talks at Geneva, before any progress has been made. Mikhail Gorbachev, the new Soviet leader, has warned that the SDI "destabilises the whole system of international relations" and has "increased the level of political and military confrontation". He has denounced the programme as a violation of the 1972 Anti-Ballistic Missile Treaty—though the US argues that the Soviets' own major radar installation at Krasnoyarsk in Central Siberia is no less illegal, Gorbachev's recent offer of a moratorium on the testing of all nuclear weapons from August was rejected point blank by Reagan.

The obstructive role of the SDI at Geneva has thrown into relief the importance the Americans attach to it. They have made support for Star Wars a touchstone of NATO unity, forcing their European allies to accept it or be seen to be weakening the West's stand in the negotiations. But the Europeans do not accept it, at least not unequivocally, and certainly not collectively: thus the silence in Bonn last week.

European concern at the SDI was voiced most effectively by British Foreign Secretary Geoffrey Howe in a long and thoughtful speech in March. Warning that no defensive system could be infallible, he argued that the "radical alteration" in NATO strategy implied by SDI—a shift from the nuclear deterrence of Mutually Assured Destruction (MAD) to a wholly defensive posture—could generate "dangerous uncertainty" in the relations between the superpowers. Noting that "research may acquire an unstoppable momentum of its own", he advised that political decisions should not be "pre-empted by the march of technology . . . prevention may be better than later attempts at a cure".

Interestingly, while German Foreign Minister Hans-Dietrich Genscher echoed Howe's doubts, both Prime Ministers Margaret Thatcher and Chancellor Kohl have appeared to support SDI. But this is not a sign of internal disagreement, rather a rhetorical division of labour. For what Thatcher and Kohl have taken care to welcome is the SDI research programme only. They have insisted that production and deployment, even testing, must be matters for superpower negotiation, a concession to which President Reagan has seemingly agreed. German and British enthusiasm is therefore strictly commercial, not military. In a calculated attempt to win support, the Americans have offered the chance to participate in the SDI research programme to all their major allies. With $ 26 bn of contracts up for the taking, and national defence sectors lobbying powerfully in the background, Britain, West Germany, Japan and Israel have all accepted (the first two, no doubt, hoping also to win current US defence orders while the going is good). But Australia, Canada and Denmark have expressed reservations about joining a "process where we don't call the shots and over whose parameters we have no control", as Canadian Prime Minister Brian Mulroney put it. More crucially, France has rejected the US offer outright. President Mitterrand is particularly concerned that Europe should not "waste" its best talents on American research, and has set up his own independent European Research Co-ordinating Agency to develop the same high technology. But he has so far not succeeded in winning the Germans and British (or anyone else) to his plan. The lack of a unified European response to Star Wars was awkwardly exposed at a meeting of the West European foreign and defence ministers in April; as Genscher unhappily put it: "It will be each man for himself, but in a co-ordinated sort of way".

The disagreements over the SDI within the Western Alliance come at a time when the worldwide peace movement is at its strongest. In Britain, for example, the Thatcher government has been forced into even harsher police and judicial harassment of the growing civil disobedience campaign against nuclear weapons. In February a small peace camp at the Molesworth Cruise Missile base (second after Greenham Common) was brutally destroyed in a night-time raid by no less than 1,500 policemen and soldiers, personally overseen by the Defence Minister, Michael Heseltine. In April throughout Europe, the US, Australia and New Zealand, hundreds of thousands of protestors marched and demonstrated for peace. The revival of anti-nuclear protest was sparked in 1979-81 by the NATO decision to deploy US medium range Cruise and Pershing missiles in Europe, and European leaders are anxious not to give it a further boost by too openly welcoming the SDI. But nor are they willing to divide the Alliance even more by rejecting the US proposals.

The consequences of their failure to do so will reverberate long after the present heads of government have passed into history. As 'Star Wars' turns from fantasy into fact, research into testing and production, the USSR's military space programme will inevitably not be far behind. An arms race in space can only further imperil the Earth.

# Reporting to Each Other

**Sumanta Banerji**

**In Search of Answers: Indian Women's Voices from 'Manushi'** ed by Madhu Kishwar and Ruth Vanita; Zed Books, London, 1984; pp 312, price not mentioned.

THERE is an old Bengali saying which banters at the typical male attitude towards women: '*poodbe naari, oodbe chhai, tabey naarir goon gai*', which translated literally means: "we praise a woman's virtues only after her body is cremated and the ashes scattered". The hypocrisy of Indian society is nowhere better demonstrated than in its attitude towards women. While our Constitution and laws grant women equal rights and opportunities and our religions turn women into goddesses, the tradition of 'suttee' (which is being revived in some parts of the country) is being revamped in a modern macabre shape by husbands and in-laws who are turning their homes into funeral pyres for brides whose parents are unable to provide the required dowry. Besides this extreme lethal form of aggression against women, there are various other degrees of persecution and exploitation at different levels of society, some of which are surreptitious, some openly sanctioned by social norms, some introduced curiously enough by the so-called drive for modernisation.

The present book brings together accounts of these various types of violence—narrated mostly by women themselves—as well as reports of their efforts to resist through struggles, from diverse situations in different parts of India. Collected from the journal *Manushi*, one of the few women's magazines in India which by combining both investigative journalism and theoretical analysis has played an important role in publicising and supporting the fledgling struggles of Indian women, these articles throw light on the cobwebbed corners of a highly complex socio-economic situation. One of the virtues of the collection is that there is no attempt at a simplistic answer, often resorted to by dogmatists in both Leftist and feminist circles. The title is therefore quite appropriately chosen.

Although they may never have a chance in real life to meet and exchange information about their woes, within the covers of this book porter women from Pune rub shoulders with women agricultural labourers of a Punjab village and victims of landlord and police violence from rural Andhra Pradesh. Educated daughters of middle class homes of Delhi find comrades among Harijan women of Bihar.

### COMMON DILEMMAS

While some problems are peculiar to certain segments only, almost all women about whom the book speaks share common dilemmas and anxieties. These are threats from within the family often born out of surrounding social compulsions, like child marriage, the dowry system, or traditional norms like lack of care for girls who are usually considered unwanted resulting in malnutrition and increasing mortality among women. Then there are threats from outside like discrimination against women employees—both in industries and in the tertiary and professional sectors—and the constant fear of violence from the anti-social elements and the police. Women, particularly from the poorer classes, are the first to bear the brunt of retaliation by landlords, hired goons and the police whenever these classes dare to protest against exploitation or social injustice. A common pattern is discernible from the reading of the reports of struggles. Thus in Pongri village of Nanded district, in Maharahstra, when the Dalit Mahars asserted their rights, a woman was raped by caste-Hindu landlord while "the other Dalits were fleeeing to the jungle in terror". In Beldiha, a village in the Santhal Parganas district of Bihar, Margaret Kishko, a 25-year old woman, who was one of those raped by the police said that the "policemen were armed with revolvers, rifles and lathis and as soon as they started their indiscriminate attack, the men fled for their lives to the fields". The macho instinct, which flaunts itself against the woman within the safety of the four walls of the man's own house, apparently deserts the man when more powerful men assault his womenfolk. This sort of cowardice is common among men of the educated upper class also. Some years ago when during the Holi festival, hooligans raided St Stephens College in Delhi and teased the girl students, the male students of the college slunk away—an incident which unfortunately does not find a place in the present book.

Another trend which is developing—according to the accounts narrated in the book—is family imposed restriction on the movement of women in certain societies where earlier they used to enjoy more freedom. The newly introduced curbs have been brought about paradoxically enough by so-called modernisation. Thus Berny Horowitz and Madhu Kishwar, on the basis of data collected from a Punjab village comment: "... with increasing prosperity in the village in recent years, the men, especially the Jats, are drinking liquor more heavily, and there is more violence in the village as a result, especially at night ... The result of all this is that an informal sort of curfew has come to be imposed upon women. Most women said that they cannot step out of the house because of drunkards in the village." Again, in Patiala in Punjab, another report included in the book states, "Dalit women have so far enjoyed somewhat greater equality and autonomy *vis-a-vis* the men, because right from childhood they begin to contribute to the family income. But vicious middle-class norms are obviously fast percolating downwards to these communities. In fact, there is a growing feeling among Harijan men of all communities against letting women work. They want to stop their women from working outside because they feel this exposes them to such attacks." The book could have included reports of similar tendency among the tribal men in the Santhal Parganas, where mining and development projects have brought in some contractors and middlemen from outside who consider tribal women easy prey, and their menfolk as a result tend to keep them away from public gaze. Thus, modernisation is introducing a 'purdah' system in societies where women traditionally used to enjoy equal rights.

### CONNIVANCE OF WOMEN

The other disquieting feature of community behaviour which reveals itself from the accounts narrated in the book is the connivance of the majority of women themselves in the patriarchal system of exploitation of women. There is a chapter on Family Violence which highlights the dowry problem leading to bride-burning. While one can lay the blame for such connivance on rural mothers who may try to take it out of their daughters-in-law from a perverted sense of retaliation (because of what they themselves suffered as brides), what excuse can one provide for the behaviour of the mothers-in-law in the middle- and upper-middle class families of Delhi where bride-burning is becoming almost a daily occurrence? Further, what about the brides themselves, some among whom are educated and working women at that, who not only accept the dowry system when getting married, but choose to kill themselves rather than leave their homes and seek an independent way of living? Is it the fear of social opprobrium, or the lack of moral support from their parents and friends that leads them to such a desperate course of action? Some of the reports included in the collection give an inkling of the mood of the victims. Thus, Manini Das while writing about an anti-dowry campaign in Delhi speaks of a girl, Premlata, whose marriage was called off because of ever-increasing demands made by the would-be in-laws. While Premlata's parents—for a change—took a firm stand against dowry, "the only dispiriting part of the affair was the passivity of the girl herself". Manini Das, further in her narrative, focuses on a more disturbing reality. Some members of a women's organisation went to Patel Nagar in Delhi for a demonstration against a family where a bride was burnt. The women of the locality swarmed around the demonstrators shouting: "What is the use of such education when parents don't teach their daughters how to behave in their husband's house? ... Nowadays, girls can't put up with the smallest thing—they get into a temper ... Girls must learn to bear everything patiently ... The one who had to die has died. What's the use of making a noise about it?"

At the end of her account, Manini Das raises a pertinent question. "The woman who has been degraded, beaten, insulted through a whole lifetime takes her revenge on her helpless daughter-in-law—perhaps the first person who is in her power, whom she can beat and insult. How can her bitterness be transformed into a constructive protest, a collective rather than a personal anger?"

Two chapters—one on Women's Struggles and another on Women's Politics—seek to answer the question. The first is a compilation of reports, the most fascinating of which is one on the struggle conducted by the Chhatra Yuva Sangharsh Vahini against the Mohunts of Bodh Gaya in Bihar for the rights of the landless poor. Manimala, who herself was a participant, narrates the achievements as well as the failures of the movement with particular reference to the role of women. But the narrative, while emphasising the specific problems of women (e g, contradictions within the families of the participants, decision-making by women, women's rights on land, etc) goes beyond the woman's question and raises some fundamental points about the entire Bodh Gaya movement and the socio-economic environment. Like the CPI(ML) cadres, the Vahini activists lived among the landless people of Bodh Gaya, adopted their ways of life, shared their food and decided not to contest elections. But unlike the CPI(ML), the Vahini worked for 'total revolution' (on JP's model) by peaceful methods and took up social problems like drunkenness and wife-beating among the peasants. The height of the struggle was during 1979-80 when the Janata Party was in power at the Centre and in Bihar. Manimala says: "Even though the Janata government did not directly help in the struggle, they saw to it that the police did not directly attack us. That is how the struggle could stay non-violent ... direct intimidation such as raids, firings and beatings by police began only in 1980. After the setback caused by police repression, the movement could not pick up full strength again, even though the resistance and struggle continued."

## MODES OF STRUGGLE

This brings us to the larger problem of mode of conducting struggles, whether those of the Harijan landless labourers or women or other deprived sections of society. Both the introduction and an editorial from *Manushi* at the end ('Why Can't We Report to Each Other?') seek to formulate a tentative programme of action for women. I generally agree with the basic approach of linking women's struggle with the broader struggle for socio-economic changes like alleviation of poverty, guarantee of employment, end to discrimination in wages. In this broader framework, the need to acknowledge the woman's right to decision-making in the various stages of the movements and to strengthen her position within her family assume importance. Along with this the obligation of the male members of the family to share domestic chores needs to be emphasised. I also agree with the view that instead of demanding protection and justice from the state, there is need to discover alternative ways of securing justice, since the state and the police are committed to protecting and maintaining the *status quo* and this commitment invariably operates against the interests of the deprived sections of society. The reports included in the present collection show how at every stage, women's struggles for a better social or economic deal have been suppressed by the state and frustrated by the judiciary.

While agreeing with the suggestion made by the editors of the compilation that autonomous women's organisations like mohalla committees to protect women from assaults could be one alternative institution, and while supporting the new movements that are developing outside the framework of the existing political parties (e g, the Chipko movement, women's role in the Jharkhand movement, the women's consumer movement in Maharashtra), I have misgivings however regarding the editors' stress on the non-violent mode of passive resistance that they seem to uphold as the model. Some of the reports quoted in the book suggest that non-violence does not work against police repression, or landlord atrocities. On the contrary, it was violent retaliation which stopped the rape and sexual harassment of women by rich peasants in the tribal villages of Maharashtra (cf 'An Assertion of Womanpower' by Mira Savara, Sujatha Gothoskar). It was violence again, in the shape of Harijan raids on local merchants' shops for equal distribution of grains among the poor, which brought about relief (cf 'Drought—God-Sent or Man-Made Disaster?', *Manushi* editorial, July-August, 1980). History—whether during the national movement or in post-Independence India—has repeatedly taught us that organised armed resistance backed by popular support can pose the only serious challenge to the state. Gandhian passive resistance which might have had a marginal impact on some responsive policy-makers in Whitehall, has outlived its relevance in today's Indian society where a hardened and coarsened ruling class is determined to use extreme brutal force to suppress even the feeblest voice of protest. In a society where violence is the only language which the ruling class understands, it is futile to respond in terms of non-violence.

## MYTH OF GANDHI

I agree with Madhu Kishwar when she says: "Our cultural traditions have tremendous potential within them to combat reactionary and anti-women ideas, if we can identify their points of strength and use them creatively." But surely Gandhi (who is described by Madhu Kishwar as "one of the few people able to make a creative use of our powerful cultural traditions") cannot be taken as the model. In spite of his utterances against child marriage, the dowry system, and other acts of exploitation of women, he remained an orthodox Hindu male patriarch to the core in social matters. How can Madhu Kishwar discover empathy with a man who could say: "Woman is the incarnation of ahimsa. Ahimsa means infinite love which again means infinite capacity for sufferings. Who but woman, the mother of man, shows this capacity in the largest measure?" (*Harijan*, February 24, 1940). Is it not this myth about woman's "infinite capacity for sufferings" that the woman's movement is fighting against? Or take Gandhi's attitude towards 'modern' women: "I have a fear that modern girl loves to be Juliet for half a dozen Romeos. She loves adventure. The modern girl dresses not to protect herself from wind, rain and sun, but to attract attention" (*Harijan*, December 31, 1938). What could be more insulting to women?

Madhu Kishwar and her colleagues in *Manushi* stand out from other feminist groups in their ability to honestly face the reality and combine rigorous intellectual analysis with committed activism. The present book is a brilliant testimony to their struggles. But may I request them not to reinforce the myth of Gandhi in their search for alternative avenues of protest?

# Mortality Toll of Cities

## Emerging Patterns of Disease in Bombay

**Radhika Ramasubban**

**Nigel Crook**

*Concern with the environmental conditions of disease control has until recently focused on water and food-borne diseases, for the diarrhoeal diseases have been major killers, especially of young children, both in rural and urban areas. Without disputing this approach, this article seeks to redress the balance of concern, and to caution against a too generalised interpretation of emerging trends. For in some of the large and growing cities at least, the mortality pendulum seems to be swinging away from intestinal towards respiratory diseases; however, the causes of this change are not as clear-cut as the current interest in air pollution might suggest.*

### I

### Trends over Time (Bombay in Comparison with Poona)

CONCERN with the environmental conditions of disease control has, until recently, rightly focused on water and food-borne diseases, for the diarrhoeal diseases have been major killers, especially of young children, both in rural and urban areas. The intention of this article is not to dispute this approach, but rather both to redress the balance of concern, and to caution against a too generalised interpretation of emerging trends. For in some of the large and growing cities at least, the mortality pendulum seems to be swinging away from the intestinal towards the respiratory diseases; however, the causes of this change are not as clear-cut as the current interest in air pollution might suggest.

Both in Bombay and Poona, cities with relatively good quality data on cause of mortality, respiratory cases have increased far faster than diarrhoeal cases in the recorded mortality, and in some specific categories of these diseases mortality has increased faster than the overall growth of the population (Table 1).[1] This is not an unusual phenomenon in the course of urban growth. The cleansing of the atmosphere, a factor of clear importance to respiratory disease, usually occurs only at the last stage of environmental improvement. For example, as recently as 1952 in London, four thousand deaths (three times the average) followed a four-day smog, the proximate causes of death being chronic bronchitis, broncho-pneumonia, and heart disease. It is with this grim picture in mind that one might view the data in Table 1 (despite all the caveats one has to make regarding changes in diagnostic and registration practice). To take a further example, in 1980 in parts of Shanghai, infant mortality had fallen to levels comparable to those in western Europe today, and the relative roles of intestinal and chest diseases as the major killers had been reversed; cancer of the lung was said to be on a dramatic increase. In the case of London, the response to the crisis (a response encouraged no doubt by fear of a surge in the national health bill) was to outlaw the burning of unprocessed coal; the response in Shanghai has been to start enforcing the installation of anti-pollution devices in the factories.[2]

The control of the atmosphere is politically complex. Major industrial concerns add to pollution both through the production and distribution process and through the use of the products they create (e g, the automobile); and hence they wield their power against pollution control. In Bombay there has been much talk of industrial pollution especially in the Chembur-Trombay area: in actual fact the data show that central areas of Bombay city were more highly polluted, at least as recently as 1980, partly, it is argued, because the offshore air current at night pushes the polluted air from Chembur towards the west.[3] Nevertheless, there have been recent reports of gas leakages in Chembur that indicate the particular environmental hazards of that locality. Furthermore, they underline a fact regularly forgotten. It takes a crisis to make headlines. The mortality toll from industrial leakage takes its course inexorably day by day. The same mortality is only noticed, it seems, when, as at Bhopal, it is concentrated into the space of a single night. The industrial new-towns are no exceptions to the experience of air pollution. In Durgapur in West Bengal the evening air has become difficult to breathe, and on a February morning the whole massive complex of the steel works has, from the summit of the township, disappeared blissfully, but ominously, from view.[4] Cities are still being created anew (if not afresh) in India: in Vashi in the New Bombay the new residents observed an improvement in sewerage and drainage over their old environment, but complained that the air quality was actually worse.[5] Is this the auspicious beginning of a new urbanising era?

We have upto this point blamed the environment for these secular trends in disease, and apportioned some of the blame to the activities of industrialists. In Bombay at least, the question of air pollution has become a focus of attention recently, with reports commissioned by the Bombay Municipal Corporation and conferences on the subject hosted within the city. But we have also to point out the role of poverty in the incidence of the respiratory (as in the diarrhoeal) afflictions on the people in the cities. It is true that no social class escapes from air pollution, and if the degree of pollution is severe enough, morbidity of the respiratory tract will afflict all social groups. But exacerbating features, that more easily translate morbidity into mortality, are suffered more especially by the poor. Even in Britain today the social class differential in this disease is one of the sharpest of all.[6] First let it be noted that good shelter is a protection against a whole group of respiratory ailments. Adequate shelter is necessary to prevent loss of body heat in the cool and wet seasons of the year. One of the current authors (NC) in collaboration with Meera Bapat recently conducted a morbidity survey in shanty settlements in Poona: they found that the clearest determinant of respiratory sickness was the dampness of the individual shack.[7] In both Poona and Bombay the incidence of pneumonia in mortality, especially among infants, is relatively slow to decline.

A second socially related factor lies in the population density within the dwelling place, an index that has failed to improve significantly over the last two decades from an average of over five persons per dwellings[8] (which means, in the slum population at least, five persons per room).[9] Cramped space encourages the spread of air-borne virus or bacteria.

Thirdly, there is a prominent school of thought believing that adequate nutritional status can significantly arrest the development of tuberculosis and other diseases in an individual from a mild affliction (which may affect a majority of the population) into a serious illness against which he or she has formed insufficient immunity.[10]

Finally, the 'Catch-22' delivers its blow, in that to keep warm and to prepare safe and nourishing food (and hence retain defences against the worsening of respiratory sickness) the poor have to use the cheapest fuel they can. In some parts of the country this is low-grade coal (particularly in the eastern states), whose sulphurous waste becomes a major domestic irritant.[11]

None of these factors is peculiar to urban areas. But in urban areas they combine with industrial and commercial air pollution to exacerbate an environment that is rapidly overloading with dust, soot, and other more specific air-borne poisons.

Average life expectancy is higher in urban than in rural areas in contemporary India. This is largely due to the social composition of the towns reflecting a proportionally larger middle class which has created for itself an adequate curative medicine in the shape of large well-equipped hospitals. But this comparison (Table 3 gives comparative death rates) masks the variance in those life chances *within* urban areas, that depends on socio-economic class and, relatedly, on the micro-environment. It would indeed be wrong to interpret the figures so far offered (in Tables 1 and 2) as indicative of relative changes in disease categories affecting all classes of urban dwellers simultaneously. Furthermore, we estimate that approximately 85-90 per cent of deaths are registered in these two cities of Bombay and Poona, but it is likely that the 10-15 per cent or so missing registrations are predominantly of the poorer classes, particularly in the outer suburbs.[12] The slum survey in Poona we referred to above suggested that mortality rates, especially of children and infants, differed rather little from those in the rural areas (albeit an estimate derived from a small sample).[13] And in the spatial context commented on below, we note that some of the poorer inner city wards of Bombay experience very high rates of infant mortality (again comparable with those of rural Maharashtra). It would be unlikely if diarrhoeal diseases had diminished significantly in those shanty settlements that still are forced to rely upon unprotected water sources for drinking and the roadside for defecation purposes.[14] For the lowest income group the quality of water, sewerage and drainage may not have improved. At the same time the quality of the air has clearly deteriorated. The fight against discrimination in the basic rights of life needs now to be fought on two fronts.

Respiratory mortality is not the only broad category on record where incidence is slow or failing to decrease. There are for example major increases in the cardio-vascular disease group (Table 1). To some extent this may reflect, especially in Bombay, the westernising qualities of the middle-class diet and life-style. The incidence is at its peak above age 60 (Figure 1): the middle-class is increasingly represented in these higher age groups (as their fertility falls and life expectancy rises, reducing the numbers of the young *vis-a-vis* the numbers of the elderly). However, a further consideration is that the inter-related nature of heart and chest disease has been documented in the medical literature: cardio-vascular disease reaches a high level after air pollution crises.[15] From this the poor do not escape.

Among the significant causes of mortality that stand out is respiratory tuberculosis (Table 1 and 2). This is a disease associated, as a killer, with poverty, and exacerbated by a deleterious atmospheric environment. In some far-eastern city

TABLE 1: CRUDE DEATH RATES BY CAUSE FOR BOMBAY AND POONA IN 1980-81 AND CHANGE IN DEATHS BY CAUSE OVER TIME: 1970-71 TO 1980-81

| | Pneumonia | Tuberculosis | Total Respiratory | Diarrhoea and Dysentery | Accidents | All Causes | Population Growth Rate |
|---|---|---|---|---|---|---|---|
| BOMBAY | | | | | | | |
| Death rates per 100,000 Census population | | | | | | | |
| Males | 81 | 129 | 245 | 39 | 90 | 905 | |
| Females | 101 | 64 | 196 | 51 | 51 | 763 | |
| Annual average per cent increase in deaths | | | | | | | |
| Males | 0.5 | 4.1 | 2.2 | −1.6 | 5.8 | 2.3 | 2.9 |
| Females | −1.0 | 3.6 | 1.2 | −1.0 | 5.2 | 1.7 | 3.6 |

states (Hong Kong for example) it has been held responsible for exceptionally high male mortality from age 40 onwards in comparison with historical experience in western European cities (with the possible exception of some of the Scandinavian countries).[16] In Maharashtra at least this demographic phenomenon is neither particularly urban nor exceptionally male in character (Figure 2).[17] We have shown from the medically certified cause of death data for urban areas of Maharashtra state (Figure 1) that there is a rise in female mortality that becomes exceptional at rather older ages than for men and is attributable to bronchitis and heart disease. We can show with considerable confidence from the Model Registration Scheme data that the heavy male and female rural mortality that sets in from around age 40 (Figure 2) is also due to tuberculosis, followed by the other respiratory diseases,[18] but we cannot tell from these data whether the rural TB rates are actually increasing over time (since the MRS records do not cover a sufficient time span at present). Turning specifically to the cities, the annual rates of increase due to TB are disturbing to say the least (Tables 1 and 2), for in Bombay at least they appear to outstrip the rate of population growth. It is not much comfort to calculate whether the levels are above those maintaining in the over-crowded and smog-ridden European cities at the turn of the century, or merely the same. The process of infection is believed to be such that a large proportion of the population is affected at young ages, but that diagnosis is difficult and severe morbidity and mortality tends to await the adult ages. If that is the case, this disease could 'age out' of the population with its current carriers. There are areas in Shanghai where the age pattern of mortality has changed since 1949 in a way consistent with this having occurred (Figure 3) and the recorded mortality due to tuberculosis has also fallen substantially.[19] Will areas of Bombay follow suit? Clearly not if the opportunity remains for the older population cohorts to infect the young, as it will so long as living conditions remain crowded, or curative medicine remains ill-distributed among adult sufferers (which is one of the major contrasts with Shanghai).[20]

One clearly noticeable feature of tuberculosis is the predominance in Bombay of male mortality from this cause (the phenomenon is less evident in Poona). It is therefore difficult to attribute its increasing incidence to air pollution in the macro-environment alone. Men are more likely to smoke and to drink than are women, and both can precipitate active TB (alcoholism tends to coincide with poor nutritional intake). Men are also more likely to share crowded sleeping quarters in parts of Bombay. Much more needs to be learnt about this disease in Bombay before its cause can be readily attributed to specific ecological or social factors.

The high recorded mortality due to TB in Bombay also raises an issue in data interpretation. Is migration to the city for TB treatment a factor that inflates the Bombay mortality rates? There are conflicting views on this among medical experts in the city—some estiamte 25-30 per cent of TB deaths as being due to such migration;[21] others opine that the city, being basically unhealthy, takes a heavy toll anyway of new migrants who are trying to find shelter and employment. In the absence of clear demarcation of residents from non-residents in the mortality statis-

TABLE 2: CHANGE IN DEATHS BY CAUSE OVER TIME, IN SPECIFIED AGE GROUPS FOR BOMBAY AND POONA

| Bombay 1970-80 | Asthma, Bronchitis and Emphysema | Respiratory Tuberculosis | Ischaemic and Other Heart Disease | Diarrhoea and Dysentery | All Causes |
|---|---|---|---|---|---|
| Annual average rate of change (per cent) in deaths to persons aged 5 and over: | | | | | |
| Males | 1.7 | 3.5 | 6.0 | −3.7 | 2.9 |
| Females | 2.5 | 2.1 | 7.4 | −2.2 | 2.9 |
| | Pneumonia Bronchitis, etc | | | | |
| Annual average rate of change (per cent) in deaths to children aged 1-4: | | | | | |
| Both sexes | −3.5 −2.2 | * | * | −1.8 | −1.6 |
| Annual average rate of change (per cent) in infant deaths: | | | | | |
| Both sexes | 1.0 −3.4 | * | * | −0.0 | 0.0 |
| Poona 1965-78 | Asthma, Bronchitis and Emphysema | | | | |
| Annual average rate of change (per cent) in deaths to persons aged 5 and over: | | | | | |
| Males | −0.6* | 6.7 | 6.5 | 7.9 | 4.6 |
| Females | 2.4 | 1.9 | 8.2 | 8.3 | 3.2 |
| | Pneumonia | | | | |
| Annual average rate of change (per cent) in deaths to children aged 1-4: | | | | | |
| Both sexes | −3.5 | * | * | −0.1 | −1.1 |
| Annual average rate of change (per cent) in infant deaths: | | | | | |
| Both sexes | 2.2 | * | * | −0.1 | −0.5 |

*Note:* * Rates based on small numbers not entered; for adult bronchitis in Poona rates calculated for 1970 to 1978; in all cases where possible an average of two years has been taken at either end of the period.

tics, it is difficult to estimate the proportion of deaths contributed by people coming to the city either because of inadequate facilities in the mofussil areas or drawn to the city's sophisticated medical centres. In the case of Poona, where the records are published so as to distinguish residents from non-residents, it is clear that about 30 per cent of TB deaths occur to non-residents of the city. But even if we take this possibility into account, TB remains higher in Bombay than in Poona by a clear margin (Table 1).

TABLE 3: CRUDE DEATH RATES FOR INDIA, MAHARASHTRA, BOMBAY, AND POONA, 1977-79 (Per thousand estimated population)

| | India | Maharashtra |
|---|---|---|
| Rural | 15.1 | 12.7 |
| Urban | 9.0 | 8.4 |
| | Bombay | Poona |
| Males | 9.8 | 8.6 |
| Females | 8.6 | 8.2 |
| Both sexes | 9.3 | 8.5 |

*Source*: India and Maharashtra, Office of the Registrar General, *Sample Registration System Bulletin*, New Delhi, 1982; Bombay and Poona, estimates from sources given for Table 1 above.

Further class differentials may be revealed indirectly in the sex differentials in urban mortality. Tim Dyson, in an earlier number of *EPW*, has illustrated how the much discussed excess female mortality (compared to that of males) in India only exists in the younger age groups.[22] The sex differential continues to persist, however, in particular cause of death categories in the data for major cities of Maharashtra. This is predominantly the case in mortality related *directly* (in the medically certified records) to nutritional deficiencies among the very young (i e, from avitaminoses or anaemia).[23] Excess female gastro-enteritis in the age group 1-9 is also indicative of inappropriate or inadequate feeding of young female children (Figure 1). It is clear that among the urban population in the lowest income group the presence of poverty enhances sexual discrimination exactly as in rural areas. Note also (Figure 1) the excess adult female deaths due to fires. These too are likely to be the result of single room slum dwelling where cooking stove accidents are prone to occur, especially where kerosene is the fuel used as in Bombay.[24]

TABLE 4: SPATIAL DISTINCTIONS IN MAJOR CAUSES OF DEATH IN BOMBAY, 1980-81

| | Respiratory Tuberculosis | Bronchitis, Asthma, Emphysema | Ishaemic Heart Disease | Gastro-Enteritis | Nutritional Deficiencies | Infant Mortality Rate Per 1000 Live Births |
|---|---|---|---|---|---|---|
| **Crude death rates per 100,000 Census population** | | | | | | |
| **Island city** | 130 | 38 | 108 | 37 | 23 | 68.5 |
| **Suburbs** | 73 | 30 | 60 | 39 | 26 | 64.5 |
| **Extended subs** | 54 | 27 | 53 | 32 | 12 | 52.7 |
| **Greater Bombay** | 91 | 32 | 77 | 37 | 22 | 63.3 |

## II

## Spatial Dimension in Bombay

The wards which make up the island city may be broadly described thus: A ward—predominantly trading activity, the central business district, and docks along the east end; B ward—docks, warehouses, traders and goods yards; C ward—traders, and a highly dense population; D ward—affluent and primarily residential population, and the less polluted western seaboard; E ward—docks, the inner city rundown areas, with dilapidated buildings, and footpath dwellers; F-South ward—mills and docks, chawls housing the mill workers; F-North—partly docks and partly slum colonies (consisting of 30 per cent of ward population in 1976), some middle-class housing; G-South and G-North—mills, slum colonies (consisting of 34 per cent of ward population in 1976), middle-class housing.
